CHANGE OF TITLE.

NEWS Being Substituted for REVIEW.

Hereafter this journal will be known as the California Architect and Building News. This change has been decided upon as shortening the title line one syllable, and as more appropriate to the objects and character of the journal. We presume that our readers and friends will cheerfully acquiesce in the adoption of the new name as more appropriate and convenient.

Pacific Coast Association of Architects.

The regular monthly meeting of the Association was held on Friday, the 6th inst., President Laver in the chair. The number present and the interest manifested in the proceedings were exceedingly gratifying, and confirmatory of the hopes of its projectors and founders, that the Association will in time become one of great importance and influence generally, and of special value to the profession on this coast.

After the reading and adoption of the minutes of the previous meeting, the committee appointed at the December session to consider and report upon the designs presented for a front page and heading for this journal, made their report, which will be found in another column of this issue, to which we call the special attention of architectural draughtsmen and students generally upon this coast; hoping that the inducements offered in the way of premiums, and the guide therein furnished, may result in something handsome in itself, and alike creditable to the successful parties, and the young men of the profession generally. This may fairly be considered as the commencement opportunity for our young men, to be followed by other inducements hereafter to be devised, calculated to stimulate ambitions and open up a broader field to those who have resolved upon the architectural as the chosen pursuit of life.

The committee on by-laws reported progress, awaiting such action as may be adopted in the matter of resolving the Association into a *chapter* of the "American Institute of Architects."

The Secretary submitted his report in reference to signatures by the architects of San Francisco to the petition in favor of Mr. Laver's appointment as architect of the New City Hall, to which scarcely a single architect in the city called upon had declined to add his name; and those who had declined did so upon other grounds than opposition to the appointment. The petition as signed was, by vote of the Association, handed to Mr. Laver, who with appropriate and earnest remarks returned thanks to the Association and members of the profession generally, for this kindly expression of confidence and professional esteem.

The matter of forming a "School of Designs" was discussed favorably, with unanimous approval of the adoption of measures in the near future calculated to enlist the interest of students of architecture in higher and more perfect architectural culture and attainments. Many of the young men in the profession exhibit qualifications to become competent architects, and will in time enter upon the practice of the profession with the qualifications acquired through the preparatory advantages enjoyed, whether the Association assist them in their studies by establishing schools of designs and otherwise, or refuse the helping hand by barring the doors of opportunities, and leaving them to work out their future unassisted. Consequently we consider a perfected movement of the kind suggested one of vital interest to the profession generally, as through its influence our offices will be supplied with more competent draughtsmen, and the "coming architects"—those who will work the field now occupied by many of us who have grown gray through long years of diligent study and application to the duties of our profession—will be the better qualified to pick up the threads broken by retirements or the hand that severs all earthly ties, and the generous helping of those who are striving to learn will bring its own reward.

The Secretary also reported the acknowledgment of the receipt by the American Institute of Architects, convened in annual session, of the application of Messrs. Wright, Curlett, Welsh, Sanders, Babson, and J. E. Wolfe, to become members, with the information that the applications were hailed with manifestations of great pleasure, as completing the circle of the Institute's influence from the Atlantic to the Pacific shores of our great country. We hope that this coast will be duly represented at the next annual convention, in the person of a representative from the membership in California. We may add, that since the meeting of Friday last the members elect have received their credentials, or notices of election.

A resolution appreciative of Mr. Wright's course in connection with the egresses from theaters and public halls was passed unanimously.

The President then called the attention of the Association to the fact of the death of the late Mr. George Edmund Street, a distinguished English architect, whose exceptionally high reputation placed him in the profession second to none living. Also, President Royal Institute British Architects, a Royal Acadamecian, a Fellow of the Society of Arts, Professor of Architecture at the Royal Academy, London, England, Architect of the New Law Court, London, and many large public and private buildings in Europe. In addition to his splendid qualifications as an architect, he also possessed fine literary abilities, having published a book on Brick and Marble architecture in Italy, and another on Gothic architecture in Spain; and in various ways established his superior abilities as an architect and writer, in the broader and more comprehensive senses. The death of eminent men in any profession causes a feeling of regret and sympathy in all hearts; but in the case of Mr. Street the sentiment of sorrow is more special to the architectural profession, particularly as he has been called away almost in the prime of life, and before his great work was fully completed.

A committee of three was then appointed, consisting of Messrs. Wright, Sanders, and J. E. Wolfe, to prepare suitable notice of the sad event.

The meeting then adjourned, to meet the first Friday in February.

Inventors and Progress.

One who sign himself "Inventor" writes in answer to some strictures passed upon inventors by a Stockton paper, claiming that inventors are idle, designing persons, who are always endeavoring to live without work, always looking for the opportunity to entrap some unwary capitalist into investing money in their inventions. Such remarks applied to the inventors in general is a base, ungrateful slander. One has only to look into the present working of any department of the arts or manufactures to learn the service of invention to industry. Every item of progress, from the rude processes and appliances of the ancients, has been the work of the inventors. As a rule, the improvements have cost a great amount of experiment and effort and actual outlay to those who have achieved them. There is, of course, now and then a happy thought; but the average of effort for each invention is very great. It is but natural that the successful laborer in the field of invention should desire to enjoy a part of the fruits of his labor, and the people of the United States and other civilized countries have decided that his claim is a just one. What would farming be without the triumphs of the inventor? Contrast the labor it is now possible to accomplish by one man's labor with what was done by a man in the early days. Contrast the gang-plow with the forked stick, the self-binding reaper with the sickle, the thrashing outfit with the flail. People who decry the service of the inventor to the industries are relics of a bygone age. They have no part or parcel in the progress of the day. Agriculture has enjoyed her full share of the inventors' attention, and while she has been advanced, they, in turn, or many of them, have become enriched. It is a case of useful labor well requited, and there is much of it to do. Excellent as are our agricultural tools and machines, no one can tell what further improvement may come to them through the inventor's earnest efforts.—*Mining and Scientific Press.*

The Oakland Hall of Record.

We refer to the recent trial of a case in one of the courts of Alameda County, in which the profesional integrity of the architect of the Hall of Records, erected in 1879, was sought to be impeached, mainly in view of its bearing upon the profession generally. Whether justifiable or not, it is the common rule among the masses to criticise, and impose upon the several classes of professions the odiums created by the personal acts of individual members. The great injustice of this rule, however, must be admitted by all reasonable and intelligent men. There can be no profession or calling named in which there are no faulty natures and dispositions—the church of the Most High itself, and the numerous benevolent institutions designed for good to mankind, not excepted. It therefore follows, that individuals alone should be held responsible for their acts, without any reflection upon the class with which, by business or professional relationship, they may be connected.

We do not propose to enter into the merits of the case referred to, in which Mr. Nutting charged that the architect, Mr. Stokes, received money as a bribe, by which the public interests of Alameda County were made to suffer; if such was the fact, the jury decided the charge not sustained, from lack of proof or otherwise, as the case may be, and so far vindicated the defendent, leaving him at least legally exonerated from the charge. Still, the fact that the charge was made, with many presumes the occurrence of some irregularity, which, whether justified or not, has created a public sentiment for and against each of the respective parties to the suit: as the theory is universally accepted, that where there is smoke there must, in the nature of things, be some fire. Consequently, it is an unfortunate affair, as, beyond all possible prevention, some will cling to the probability of moral guilt, although the acquittal removes all legal responsibility. The case suggests two considerations worthy of notice: First, as sustaining the recent efforts of the architects of this coast in founding and sustaining an architectural association, designed to cultivate and bring into practice a higher sense of duty among its members, and the adoption of such regulations as shall deter those who might be unmindful of the responsibilities which rest upon them from violating good faith and honest performance of every trust. With this as the foundation, the beauties of the structure should be further exemplified by rules and regulations which would render irregularities by members a dangerous and venturesome expedient. We have an exemplification of this proposition in a recent exposure of an attorney in this city, who, seemingly having committed some irregular professional act, was subjected to investigation by the Bar Association, and being found guilty, the case was reported to the higher court, which, having the power to do so, suspended the offending party from certain privileges for a term of six months. The mere suspension, however, is but a small proportion of the penalty inflicted, the greater being the impairment of his hitherto good name and reputation. As far as the individualities of the parties to the irregular transaction were concerned, we presume that the members of the bar had no special interest; but realizing that if they sustained the gentleman who, for the time being at least, disregarded the purity of obligations resting upon him as an attorney, by continuing him in undisturbed fellowship as a member of the bar, they would thereby assume, in effect if not in fact, the responsibilities of the questionable transaction; and as a necessary protection to their common interests and the reputation of the bar, the course pursued was adopted.

The Architectural Association, however, has no powers above its own organization, whose authority may be invoked to inflict punishments. But this it can do: Establish unimpeachable rules of practice, admit to membership none but worthy and qualified men, and exercise a mutual watchcare over the general interests of the profession, holding to strict accountability every member who shall be found guilty of wrong-doings. And in cases where it is fully deserved, follow the example of the Bar Association, so far as to let the public understand the estimate in which the association holds its members when guilty of crooked procedures. By such a course, and other wise and self-protecting regulations, the honorable men in the profession will surround themselves with defenses which must prove personally beneficial; while the community will be advised as to who are unwilling to assume or have violated society rules and regulations, leaving it to owners to choose between men of recognized competency and integrity, and those who prefer not to bind themselves under obligations which furnish at least reasonable assurance of faithfulness and honesty. But space will not permit enlargement upon the many suggestions which naturally arise in the consideration of the matter in hand. Again: the subject-matter of this article presents strong arguments in favor of the position assumed by this journal upon the matter of "competitions." The plans in the case in question were competitive; and those presented by Mr. Stokes being approved, upon merit or through personal influence, as the case may be, he was naturally awarded the superintendence, which led to the suit referred to. Had it been otherwise, and the gentlemen having the matter in hand devoted as much time to the selection of a recognized competent and responsible architect as they did in the matter of competition, they would at least have secured a far more handsome building at the same outlay, and quite as likely avoided the unpleasant issues which have developed from the course pursued. Mr. Stokes might have been the selected party, but if so, it would have been under widely different circumstances; and with integrity on the part of the managing powers, he would have held himself above all money approaches from those performing the work of construction. The system of competition for plans involves and invites departures from rectitude on the part of all concerned, and the sooner it is entirely abandoned, and the "cat's-paw" use that is so generally made of the profession in such cases dispensed with, the better it will be for all parties concerned and the common interests of the profession.

A Curious Building.

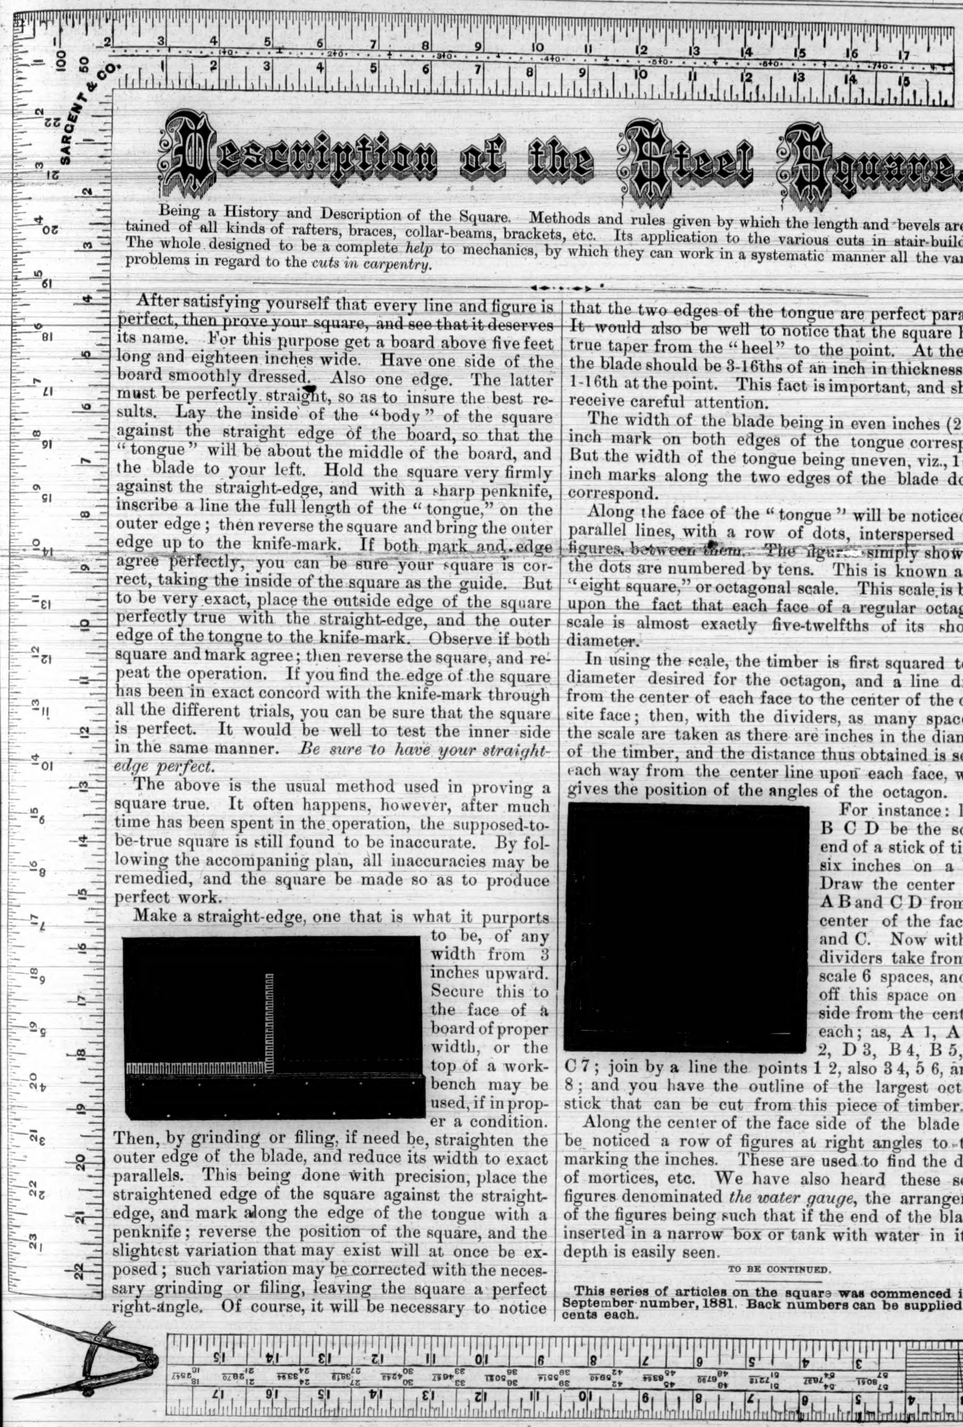
A writer in the *British Advertiser* makes mention of a little church in Essex, built in the early part of the eleventh century, of which the walls are composed merely of portions of trunks of trees—thick outside slabs—split or roughly hewed off, measuring twelve to eighteen inches across, and ten to twelve inches thick, roughly joined with tongues, but smooth on the inside. These uprights, never more than five to six feet high, were originally tenoned into a head and sill, but in restoration, carefully carried out some years ago, the sill had to be removed, and the lower ends of the timbers cut off as far as they had rotted, and a new sill on brick work substituted. Substantially, however, we see a wooden chapel of the eleventh century, and the timbers sound and healthy, standing as they were then set up. One of them on the north side, where there was an original doorway, has a notch cut into it for the purpose of holding a holy water vessel. It seems pretty certain that this chapel was erected for the purpose of receiving as a temporary resting place the body of St. Edmund, the King. So here is an open book on the earliest wooden construction in England, which any one may read.—*Southern Manufacturer and Builder.*

A Lesson In It.

Although the recent falling of two brick buildings in the city of New York was attended with fatal consequences, the occurrence has had a wholesome effect in other connections. It has at least aroused and vitalized the attention and energies of the Building Bureau of that city, the "inspectors" of which have found well-nigh two hundred unsafe buildings, which the occupants have been warned to vacate, the owners notified to tear down immediately, and the police placed on watch over them, to give timely warning in case of sudden imminent danger. There has also been found nearly as many other buildings so much out of repair that the owners have been notified of the necessity for further investment on repair account.

The fact that the greater number of the condemned buildings are not old, dilapidated affairs, but of more modern construction, illustrates the departures from right rules and practices in constructive science so generally practiced in almost all cities during the last ten or twenty years. In numerous cases, the old idea of "building well" has given way to the shoddy class of constructions, particularly those erected for rent or sale. It is astonishing how little value is placed on human life and health by those who build houses for other people to live in. The controlling purpose of such owners is economy, cheapness of construction, with but little regard to the many bad consequences which so generally follow in such cases. It is well and [illegible] for owners of real estate, and all others, to use legitimate and wise economy in all things; but no one should be permitted to practice savings which endanger the life or health of others. And as we know of nothing in the common order of things which is more dangerous to life and limb than buildings so constructed that they are liable to tumble down at any moment, and that, too, as a rule, with no preceding warning to those unfortunate enough to be found under their roofs.

There are three *special* reasons why the matter of house building should be legislated upon, and laws and ordinances passed regulating the manner of construction, and the quantity and quality of material to be used. The first of these is that already mentioned, the great desire of owners to secure large returns upon their investments. This is all right and proper, when fair and just considerations control in all other directions. But when sought at dangerous risks to others, and with no regard to common rights, there should be some means provided to regulate matters. Again: there are thousands of reckless men claiming to be practical mechanics, who should be under such control as would prevent them perpetrating the bad things so often done to the disgrace of mechanical pursuits—men who care nothing for consequences, however sad and terrible they may be, so that by the operation they pocket the larger amount of filthy lucre. It is no uncommon thing to hear such men express their entire indifference to all that may happen as the result of their imperfect work, so that they "get it off of their hands" and obtain their pay. The third special reason is, that there is to be found in every city of any note men professing to understand the the science of architecture, who are almost profoundly ignorant of all right architectural knowledge, and incapable of determining the compressive, tensile, or any other quality or value of the material employed, simply gaining positions as architects by means of misrepresentations or the sale of their *worthless* services at a nominal price. It is not to be wondered at, that buildings erected under such circumstances should tumble down, nor should their falling cause regret or sympathy upon the part of others, so that those who caused, designed, and executed their erections, and no others, should be occupants at the time of the tumbling.



Description of the Steel Square.

Being a History and Description of the Square. Methods and rules given by which the length and bevels are obtained of all kinds of rafters, braces, collar-beams, brackets, etc. Its application to the various cuts in stair-building. The whole designed to be a complete *help* to mechanics, by which they can work in a systematic manner all the various problems in regard to the *cuts in carpentry.*

After satisfying yourself that every line and figure is perfect, then prove your square, and see that it deserves its name. For this purpose get a board above five feet long and eighteen inches wide. Have one side of the board smoothly dressed. Also one edge. The latter must be perfectly straight, so as to insure the best results. Lay the inside of the "body" of the square against the straight edge of the board, so that the "tongue" will be about the middle of the board, and the blade to your left. Hold the square very firmly against the straight-edge, and with a sharp penknife, inscribe a line the full length of the "tongue," on the outer edge; then reverse the square and bring the outer edge up to the knife-mark. If both mark and edge agree perfectly, you can be sure your square is correct, taking the inside of the square as the guide. But to be very exact, place the outside edge of the square perfectly true with the straight-edge, and the outer edge of the tongue to the knife-mark. Observe if both square and mark agree; then reverse the square, and repeat the operation. If you find the edge of the square has been in exact concord with the knife-mark through all the different trials, you can be sure that the square is perfect. It would be well to test the inner side in the same manner. *Be sure to have your straight-edge perfect.*

The above is the usual method used in proving a square true. It often happens, however, after much time has been spent in the operation, the supposed-to-be-true square is still found to be inaccurate. By following the accompaning plan, all inaccuracies may be remedied, and the square be made so as to produce perfect work.

Make a straight-edge, one that is what it purports to be, of any width from 3 inches upward. Secure this to the face of a board of proper width, or the top of a workbench may be used, if in proper condition.

Then, by grinding or filing, if need be, straighten the outer edge of the blade, and reduce its width to exact parallels. This being done with precision, place the straightened edge of the square against the straight-edge, and mark along the edge of the tongue with a penknife; reverse the position of the square, and the slightest variation that may exist will at once be exposed; such variation may be corrected with the necessary grinding or filing, leaving the square a perfect right-angle. Of course, it will be necessary to notice that the two edges of the tongue are perfect parallels. It would also be well to notice that the square has a true taper from the "heel" to the point. At the heel the blade should be 3-16ths of an inch in thickness, and 1-16th at the point. This fact is important, and should receive careful attention.

The width of the blade being in even inches (2), the inch mark on both edges of the tongue correspond. But the width of the tongue being uneven, viz., 1½, the inch marks along the two edges of the blade do not correspond.

Along the face of the "tongue" will be noticed two parallel lines, with a row of dots, interspersed with figures, between them. The figures simply show that the dots are numbered by tens. This is known as the "eight square," or octagonal scale. This scale is based upon the fact that each face of a regular octagonal scale is almost exactly five-twelfths of its shortest diameter.

In using the scale, the timber is first squared to the diameter desired for the octagon, and a line drawn from the center of each face to the center of the opposite face; then, with the dividers, as many spaces of the scale are taken as there are inches in the diameter of the timber, and the distance thus obtained is set off each way from the center line upon each face, which gives the position of the angles of the octagon.

For instance: let A B C D be the square end of a stick of timber six inches on a side. Draw the center lines A B and C D from the center of the faces A and C. Now with the dividers take from the scale 6 spaces, and lay off this space on each side from the center of each; as, A 1, A 8, D 2, D 3, B 4, B 5, C 6, C 7; join by a line the points 1 2, also 3 4, 5 6, and 7 8; and you have the outline of the largest octagon stick that can be cut from this piece of timber.

Along the center of the face side of the blade will be noticed a row of figures at right angles to those marking the inches. These are used to find the depth of mortices, etc. We have also heard these set of figures denominated *the water gauge*, the arrangement of the figures being such that if the end of the blade is inserted in a narrow box or tank with water in it the depth is easily seen.

TO BE CONTINUED.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

Competitive Designs.

REPORT OF THE COMMITTEE TO WHOM WAS REFERRED THE SUBJECT-MATTER OF THE FOLLOWING REPORT.

To the Pacific Coast Association of Architects:

GENTLEMEN—On the 4th of November last, an invitation was issued by the proprietors of THE CALIFORNIA ARCHITECT AND BUILDING NEWS, to the architectural draughtsmen and students of the coast, calling for a design for a new front page and heading for their journal. Two premiums, the first of $25, and the second of $15, were also offered by this Association for the two best designs.

In compliance with that invitation, seven designs were received, and duly inspected at the regular meeting of the Association in December last, at which also the undersigned were appointed a committee of three to consider said designs and make the awards.

In due time, the commitee met, and finally agreed upon the following recommendations:

1. To return all the drawings received to their respective authors, with criticisms thereon.

2. To readvertise for new designs, inviting all to compete, and adding $20 to the sum of premiums (offered by the proprietors of the CALIFORNIA ARCHITECT AND BUILDING NEWS), and dividing that sum into three several premiums of $30 for the first, $20 for the second, and $10 for the third best design submitted.

3. To recommend the adoption of local as well as architectural features in the designs.

4. The competition to remain open for three months; i. e., from January 1st to April 1st, 1882. The drawings to be submitted at the first regular meeting of the Association in that month.

The committee also recommend the issuance of the following

ADDRESS TO THE ARCHITECTURAL DRAUGHTSMEN AND STUDENTS OF THE PACIFIC COAST.

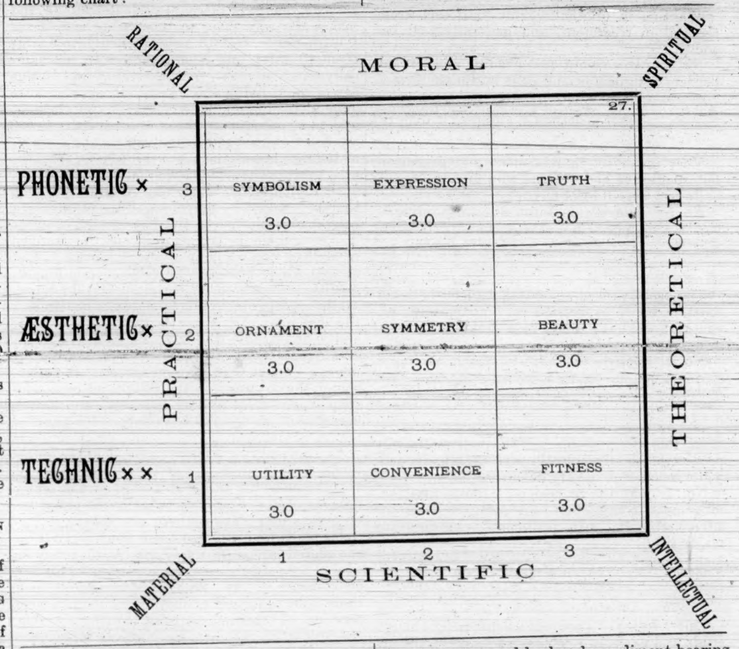
GENTLEMEN—In response to the late offer of two premiums for designs for a new front page for the CALIFORNIA ARCHITECT AND BUILDING NEWS, seven designs were received. The same having been laid before the P. C. Association of Architects, the undersigned were appointed a committee of three to consider the same.

Upon careful examination, none of the designs were found fully appropriate for the purpose intended. It was therefore deemed best to return the drawings to the respective authors, with criticisms thereon. At the same time, to avoid the appearance of breaking faith with the competitors by failing to make an award, their consent was in most cases obtained to the mode of procedure proposed. Moreover, $20 additional has been added to the premiums, making the total sum $60. The competition will remain open three months, from the 1st of January to the 1st of April, 1882. The drawings to be submitted at the first regular meeting of the P. C. A. O. A., to be held in the month of April next. The committee also stipulate, that to obtain a premium the drawings must be so perfect as to admit of transference to the block; the size to be exactly the same as the printed portion of the present front page of the CALIFORNIA ARCHITECT AND BUILDING NEWS; the title to be the same as at present, substituting NEWS for REVIEW; the designs to include such local as well as architectural features as will best identify it with the city, State, and coast. The designs may embrace the whole page, or any part thereof, leaving space equal to two full columns of advertisements already contracted for; but these may be disposed in any way, so long as they do not unduly interfere with the harmony of the design.

Before proceeding to criticise the designs submitted, the committee deem it necessary to establish some definite rules by which they are to be guided, and for reference in commenting favorably or otherwise on your designs. These rules or canons of criticism are those formulated for the first time by Prof. Kerr, in his History (vol. 1, intr'n, sec. 2), and may be briefly stated as follows:

1. Utility; convenience; fitness;—technic.
2. Ornament; symmetry; beauty;—æsthetic.
3. Sybolism; expression; truth;—phonetic.

These rules are more clearly presented by the following chart:



The first term is used to cover all the lower utilitarian qualities of a design, together with such mechanical excellencies of execution as may be appropriate to the subject and its uses.

The second term is employed to express those qualities which afford pleasure to the senses, and includes harmony, euphony, and many other qualities, together with such peculiar artistic beauties of execution as the subject demands.

The third term embraces all those still higher and nobler qualities of art which add to mechanical excellency and beauty of form, the crowning glories of poetry, symbolism, and truth.

To fully apply these measures of excellence, and to justly discriminate between the good and the bad qualities of a design, as well as to faithfully point out the false and true principles prevailing therein, is often a difficult and delicate task; and the committee, while striving to be just, hope to avoid in their brief examination at least all tendency to hypercriticism. At the same time, they believe they fully appreciate the importance of the task committed to the young designers of the profession on this coast, and desire to encourage to the utmost all efforts on their part, however humble, to break through the trammels of mere usage, and rise to the purer and freer atmosphere of utility, beauty, and truth.

In considering the designs submitted, we have endeavored to classify them: 1st, Into half-page designs. 2nd, Heading and side border designs. 3rd, Head designs. 4th, Full page. These are numbered 1 to 7, in the order named, which, however, does not indicate in any way the degree of merit attached to each.

Giving a value of three to each quality in our table of equivalents, we determine their merit accordingly.

Design No. 1. Half-page, major title, borne in frieze carried on columns of the four orders, central medallion of architecture, inclined scrolls being minor title, sybolic subjects below, tools and architectural fragments, string divides page in center, and broken by pediment bearing date, etc., in the center.

Technical qualities, fair; utility and convenience prevail; fitness, somewhat wanting in details; æsthetic qualities, moderate; ornamental parts, ill drawn; symmetry, fair; beauty, not conspicuous; phonetic elements, largely developed; sybolism and expression, strong; truth, deficient; prevailing feeling of unoriginality, with a manifest absence of local features to identify the design with the Golden State; to sum up:

Technical qualities—utility 3, convenience 3, fitness	2—8	
Æsthetic " ornament 1, symmetry 2, beauty	1—4	
Phonetic " symbolism 2, expression 3, truth	2—7	
Total equivalents of merit,		19
Possible total equivalents of merit,		27

Design No. 2. Half-page, central space containing figures sybolizing painting, architecture, and building; first part of major title borne on panel below figure; second half of major title combined with minor title on scrolls crossing center of page, ornamentation very elaborate; the whole wanting in utility and fitness; arrangement of titles confusing and inconvenient; the symbolism deficient in appropriate and definite character; the ornamentation without meaning; the whole tinctured with a strong flavor of unoriginality. The half-page defect is increased by the absence of all lines of connection with lower part of page, and by a general overloading of ornaments, which the undoubtedly skillful drawing and beauty of execution does not relieve. The total absence of local features is also a fatal defect.

Technical qualities—utility 1, convenience 1, fitness	1—3	
Æsthetic " ornament 3, symmetry 2, beauty	2—7	
Phonetic " symbolism 2, expression 1, truth	1—4	
Total equivalents of merit,		14

No. 3. Initial letter heading, and left side bold architectural border; also, right side and bottom lighter medieval, in original suggestion, very conventional in general design.

Technical qualities—utility 3, convenience 2, fitness	1—6	
Æsthetic " ornament 2, symmetry 2, beauty	2—6	
Phonetic " symbolism 1, expression 1, truth	1—3	
		15

Wanting in originality, but local and architectural in treatment, and generally well balanced.

No. 4. Unconventional heading and left side border continued around page by simple lines.

Technical qualities—utility 1, convenience 1, fitness	0—2	
Æsthetic " ornament 0, symmetry 0, beauty	0—0	
Phonetic " symbolism 2, expression 2, truth	1—5	
		7

Very imperfect in treatment and execution, but suggestive and original in a higher degree; quite wanting in local features.

No. 5. Conventional initial letter heading.

Technical qualities—utility 3, convenience 2, fitness	1—6	
Æsthetic " ornament 2, symmetry 2, beauty	2—6	
Phonetic " symbolism 1, expression 1, truth	1—3	
		15

The useful and pleasing qualities fairly developed, those of expression very moderately; execution good, but wanting in originality of general design and local expression.

No. 6. Conventional initial letter heading.

Technical qualities—utility 2, convenience 2, fitness	1—5	
Æsthetic " ornament 1, symmetry 2, beauty	1—4	
Phonetic " symbolism 1, expression 0, truth	1—2	
		11

In this design, the useful qualities largely predominate. The pleasing are less pronounced, while expression is very deficient.

No. 7. Full-page design; architectural arrangement comprising two compartments for advertisements, with pedimented heading for major title.

Technical qualities—utility 2, convenience 2, fitness	1—5	
Æsthetic " ornament 1, symmetry 2, beauty	1—4	
Phonetic " symbolism 1, expression 0, truth	0—1	
Total equivalents of excellence		10

This "design of a young draughtsman," though crude and unskillful in the execution of the ornamental parts, is otherwise well executed. The design, though commonplace and wanting in originality in almost every particular, is at least an effort in a direction untried by others, and capable of successful development.

Respectfully submitted.

GEO. H. SANDERS.
WILLIAM CURLETT.
JOHN M. CURTIS.
Committee.

NOTE.—Competitors will please bear in mind that the drawings should be made on *white* cardboard; that the ink should be dead black; the lines strong, sharp, and clear, and as little rubbing out as possible done, as the smoother the surface the better will be the transfer. The points suggested will have considerable bearing upon the final result. Some of the designs presented showed evident lack of care in providing draughting squares and triangles with perfect edges. It should be borne in mind that bruised, crooked, or irregular edges are apt to produce results fatal in all cases of competition where artistic neatness is a consideration.

The United States will manufacture more cotton goods this year than ever before. The commercial reports show that the Southern mills have taken 45,000 bales so far, against 35,000 bales last year, an increase of 29 per cent., while the Northern mills have increased their consumption from 291,914 to 344,489 bales, an increase of 15 per cent.—*Chattanooga Tradesman.*

It is a Common Occurrence

For mechanics, in all the branches, to set up in defense of defective workmanship that it has been "done according to specifications and price." So far so good. But the effect of this upon the mechanical interests is bad. We do not claim that men should do more than they agree to do for a given sum; but all temporizing with and prostitution of quality in the mechanical arts and sciences work a common injury, inasmuch as it *lowers the standard* of mechanical qualifications, and makes the way easy, to those who have never "learned a trade," to pick up enough to enable them to enter into competition with mechanically-educated men. We also realize that in this age of rapid living and love of money, the more general inclination is in favor of the cheaper, and as a consequence the markets of the world are flooded with shoddy productions of all kinds, at the sacrifice of the more skillful and intrinsically good. The same state of facts rules in reference to house-building, and all that pertains thereto; and the prevailing disposition, as a rule, bids welcome to the lesser, and in effect discourages the better, or demands the sacrifice of skillful workmanship at about the same cost of that which possesses no recommendations in quality. This is to be regretted and deplored, as the cheapening process necessarily compels the lessening of pay to the producing classes, and enables those who have no principles to increase their wealth by the savings made in securing the "make shifts" obtainable, at the sacrifice of the interests of the skillful millions who spend their whole lives at hard toil, and only a very few of whom ever rise above the "hand to mouth" condition.

The inequalities existing throughout the entire world mainly grow out of the subserviency of the masses to the will and wishes of the lesser number. It matters not what those possessed of means may desire, there are always multitudes ready and willing to sell their services at the offered price. Scarcely any bid that may be offered for personal services goes begging for any great length of time, and only a few stand upon their right to fix and maintain a value upon such services. If this was confined to ordinary labor operations, in which mere physical force were necessary, it would be less objectionable. But unfortunately it reaches farther, entering the mechanical spheres, where genius, skill, and mental qualifications are a necessity, and subjects men of intelligence and moral worth to the disadvantages which produce these inequalities.

While there may be no practical remedy for this state of things, the mechanically artistic and skillful are perhaps innocently, still greatly, at fault, in their close application to the development of the special sciences to which they devote their lives, without due regard to the influences which surround them, and the methods and means that are necessary to secure and protect their rights. By this system of argument we desire to illustrate the folly of competent men yielding to conditions which are injurious in every right sense.

If the better class of mechanics would come together and combine in earnest efforts calculated to create better conditions and advantages, they could accomplish the object. We hold that any class of men, influenced by unimpeachable motives, with right intent controlling their acts, can accomplish anything to which they intelligently apply their energies. And we hold, further, that if with united and honest purposes the better class of contractors and mechanics would reach harmonious understandings among themselves, and adopt wise and prudent measures to correct the evils that exist, and make known the rights which should prevail, instead of yielding to and becoming participants in the wrong practices established by unprincipled men, a better state of affairs would soon prevail, and all pleas in excuse for poor workmanship would end.

But unfortunately, too many good mechanics adopt the theory that nothing can be done to interpose an effectual remedy, and therefore submit to the wrongs that be, without any effort to change them. When men say they "can't," of course that ends the matter; for those who are fixed in the doctrine of "can't," seldom make any effort to *do*. It is resolute and determined *doing* that solves all difficult problems, and smooths and equalizes the rough things of life.

We hope that the time will yet come, and that within our day, when the mechanics of San Francisco will enter upon the great work of reform in mechanical pursuits; and by united, unselfish, upright efforts, join hands as brothers in the common interests of all. We advocate no society affiliations designed to set up or favor extortions, or to establish financial obstructions in the way of general business prosperities; but we most earnestly favor all combinations of men having for their purpose the proper regulation of matters which involve their best interests individually, and the development of that which is right between man and man.

Utilization of Scrap Tin.

The vast heaps of scrap tin found about tinware works, and the quanties of refuse tin cans that form such an item in city waste, have often been made the subject of experiment to separate the tin coating from the sheet iron. Melting the scrap gives only a spongy iron, and the extraction of the tin by the action of acids or chlorine gas is too expensive, so that hundreds of tons of this material are wasted every year, and all the experiments to save it appear to prove abortive. The latest experiments, however, seem to promise a cheap method of recovering both the tin and the iron in a pure and useful shape. The tin scraps are placed in a furnace where the temperature and the supply of air can be carefully adjusted. This gives a roasting in free air that causes the film of tin on the iron to oxidize. The alloy of tin and iron under the film of tin is next oxidized, and then the scrap is taken from the furnace, and the coating of oxides on the iron is shaken off by simple machinery. This leaves the iron in a comparatively pure state, while the powdered oxides may be smelted with other tin ores, or, as is preferred by the inventor of the process, they may be submitted to the action of hot sulphuric acid, which dissolves the oxide of iron, leaving the tin untouched. The tin may then be separated from the solution of sulphate of iron and melted; while the solution may be evaporated to dryness and then placed in retorts to recover the sulphuric acid, the residue in the retorts being valuable in making paints. The waste heat from the retorts is used to assist in roasting the scrap and in evaporating the solution of sulphate of iron. Waste fruit-tins are first roasted to remove the solder that may cling to them, and are then treated by the same process. The process is one that it may be hoped will save a great deal of money now lost without recovery, and do much to rid manufacturing cities of many unsightly heaps of refuse.—*The Druggists Circular and Chemical Gazette.*

Two-cent Stamps.

We would particularly call the attention of those sending us stamps, either for copies of the CALIFORNIA ARCHITECT AND BUILDING REVIEW, or for the payment of books, to send us the amount in TWO-CENT stamps. We have now a plethora of three and six cent stamps on hand, and only desire stamps of the smaller denomination, either ONE or TWO cent.

Unsightly and Damaging Sand-Hill.

The most objectionable "sand-hill" remaining within the populated portion of San Francisco is that bounding on and extending west from Franklin Street, with the line of O'Farrell Street as about its center; its altitude being about sixty feet above the grade of Franklin Street. By it, nearly two full blocks are rendered worthless for all practical purposes, while its existence retards the grading and improvement of other valuable property between Franklin Street and Van Ness Avenue, north of O'Farrell Street. Why this hill is permitted to remain is a matter of general remark and surprise. There are but few if any more eligible and beautiful building sites within the city limits than the two blocks referred to would be, if reduced to a building grade. Why the owners of such desirable property should permit it to remain in its present wretched condition is not explainable by any practical business theory. It is commonly understood that economy is the real cause—the hope that the public will need the sand for various purposes, and in time, by degrees, will cart the hill away, without expense to the owners thereof. In the mean time, the expenses are heaping up cost, far in excess of the fancied economy, in the shape of interest, taxes, etc., while time and waiting are not likely to add anything to after value. Desirable building property has already reached about full value, and it is not likely that five or ten years hence building lots in the blocks referred to will be worth any more than they would bring at the present time if the sand-hill was removed. It is also an assured fact, that the cost of grading will be greater in the future than it would be at the present time, as the "fills"—places of deposit for removed material—are fast disappearing, and becoming less every day; and even admitting, for argument's sake, the unlikely possibility that labor may be less, the decrease in "dumps" will more likely increase instead of diminishing cost of grading in the future. The practical facts in this connection are, that grading and excavations, which twenty years ago were effected at from 15 to 20 cents per cubic yard, cannot be done now for less than 30 to 40 cents, and as high as 50 and 60 cents have been paid within the past six or eight years, when "times have been lively." Those who delay grading their property until Mission Creek and the water front fillings are completed will pay a considerable advance on present cost, as "dumps" miles away will have to be found. Besides this, the maintenance of this sand-hill is an injury to the surrounding property. If it was removed, many fine residences would be erected upon lots at present covered by sand drifted from the hill in question, while the graded property itself would doubtless be improved. Consequently, we hold that the hill is, and should be declared by the authorities of the city, a great *public nuisance*, and its removal compelled by legal process, if there is sufficient law for that purpose; and if there is not, there should be. Property owners should no more be permitted to maintain nuisances in the shape of sand-hills, which compromise the improvement of an entire neighborhood, than other citizens have to violate the regulations enacted to prevent like offenses in other forms. The owners of the property in question may claim that they have a right to do as they please with their own, and that they will grade when it suits them. Such is their legal privilege, with this qualification: that *personal rights and privileges* cease at the point where infringement upon the rights and interests of others, or the city and community at large, begins. And there exists no shadow of question that the matter under discussion is detrimental to all immediate surroundings, injurious to many who own valuable adjacent property, and subversive of the city's and taxpayers' rights generally. We wonder at the patience and submission of owners of the surrounding property, and that they have not moved in efforts to abate the nuisance, particularly City Assessor Badlam, whose elegant residence stands at the south-east corner of Franklin and O'Farrell streets, at the base of the obnoxious sand-hill, from which, during the windy season in particular, he receives "abundant showers of sand." And although his house stands at a high elevation, and faces the west, never once has it been his pleasure to behold the sun sinking beneath the western horizon, except, perchance, from a perch upon the roof.

West from this hill, between Gough and Octavia Streets, there are two other less objectionable hills, separated by the O'Farrell Street cut, but being mainly rock formation, they are less injurious to the adjacent property; but their unsightliness is a great drawback to improvements in the neighborhood, and they should be removed.

We again repeat, that the section of city in question has no superior in point of eligibility and desirableness for first-class residences, being well elevated, on the "southern slope," and lying between two, and within convenient access to three or four, lines of street railroads; and all the arguments favor immediate grading, while present facilities for deposit of the material exist. And in view of the improbability of a compensating rise in the value of the property by delaying operations, and the continuous loss in interest and tax expenses from year to year, divests the case of all feasible arguments in favor of a continuance of these *unsightly* and *damaging hills*.

The Plank Sidewalk Nuisance.

Ever since the personal injuries recived by us in April last, through the defective condition of the sidewalk in front of property owned by Mr. John D. Spreckels, and at which that gentleman has not so much as expressed a regret, although the occurrence to us was a most serious one, we have very naturally noticed the like "stumbling blocks" in various parts of the city, and have seen many men, women, and children stumble over them, with greater or less injurious effects. Hundreds of children at play are tripped up and thrown violently on the hard planking, and sometimes they have to be assisted to their homes, with bleeding noses and lacerated or bruised hands and faces. Many ladies, too, in "delicate conditions" are made to stumble; and fierce oaths from time to time issue forth from manly lips, under the provocation of sudden shocks and jars occasioned by these *cruel* and *mean* obstructions in our public thoroughfares.

We have a society for the "prevention of cruelty to animals," and there should be one, the objects of which should be the arrest, conviction, and punishment of every owner of property maintaining, permitting, or failing to remedy every defect in the sidewalks in front of his property, of the character referred to. It is but little less than *unfeeling brutality* on the part of persons who, by any means, whether neglects or positive acts, causes injury to another. The shooting down and killing of another who inflicts a blow with the fist is generally accepted by juries as a justifying provocation for the act; but the effect of one or many fist-blows are harmless compared with the injury of a limb for life, a wrenched back, or other severely painful happening occasioned by the willful and deliberate neglects of property owners.

These stumbling blocks abound more or less all the year through, but with the setting in of the rainy season they become more numerous. The rains cause the planking to swell, and if the resistance is sufficient within a given space, the planks which are the less firmly spiked bulge up and form ugly ridges, measuring from a fraction of an inch up to three, four, five, and in some cases six inches. It is unnecessary to repeat, that these ridges in sidewalks are exceedingly dangerous affairs.

The Mission section of the city is particularly cursed in many parts with this kind of sidewalks. There are a number on Valencia street, with several fearfully large "tripper ups" between 22nd and 23rd streets. On Capp street, between 20th and 21st streets, there are many bad ones, besides innumerable lesser specimens on every street. There ought to be a "privilege act" passed by the city—a law that would establish the right of the poor in such neighborhoods to tear up and use for fire-wood or otherwise the planking of all sidewalks not kept in perfect repair by their legal owners. We understand that this is rather an absurd proposition; but if there could be some peremptory measure provided which would impart a forcible lesson upon negligent owners, it would exert a wholesome influence. The slow process of law to recover damages for sprained ankles, dislocated limbs, split or displaced knee-caps, sprained backs, etc., makes many submit to their injuries rather than seek redress by the way of the legal tribunals, and thoughtless and *unfeeling* men, who should be made to pay for their neglects, become hardened in their indifferences.

Mutilated Coins.

Not until people flatly refuse to take mutilated coins, remarks the *Banking and Mercantile Register*, will the nefarious practice of clipping them die out. A coin with a hole bored in it is not worth its face value. It is easy to understand that the clippings, filings, and borings, melted together, amount to a valuable consideration, and it is apparent that the old coins have lost all that this new piece amounts to. This is the reward of the coin clipper, and his trade pays well. During Queen Elizabeth's reign, in England, the coin clippers drove a flourishing trade. Clipping coins to save the metal clipped off had become such a source of loss, that it was declared high treason, and made punishable with death. The penalty continued long after, but it seemed to accomplish no staying results. In one day, for example, seven men were hanged in London, and one woman burned, for clipping. Still the clipping went on. One coin clipper, when about to be hanged, offered thirty thousand dollars for a pardon; and Macaulay says, that this evidence of how the crime paid did more to encourage it, far more, than the hanging of the men did to discourage it. Public opinion was against the hanging, and favored the clippers, as they took so little from each piece that it amounted to almost nothing.

To show how the abuse of the coins went on, it is related that in 1695, a lot of coin that should have weighed two hundred and twenty thousand ounces was weighed, and really showed one hundred and fourteen thousand ounces. Nearly half the value had been abstracted.

The penalty for coin clipping in the United States, at the present time, is a fine of two thousand dollars and two years in prison. How soon the practice will die out altogether it rests entirely with the people to decide.—*Leffel Mechanical News.*

The term "charcoal" on tin plates is a fraud, and always was. None but coke irons have ever been used in the manufacture of tin plate. In fact, the most ductile irons made in England or on the continent of Europe are smelted with coke. This country produces brands of iron better adapted to making tin that any in the world. Our best West Tennessee and Alabama irons are as much superior to British brands for tin plate as they are for boiler iron or carwheels. —*Chattanooga Tradesman.*

"First-Class."

The indiscriminate application of the term "first-class" to almost everything done or produced divests it of any practical, defined, or certain meaning. Yet people are deceived by it, and frauds of the most shameless character are perpetrated by promises and pledges that the thing proposed is or shall be "first-class." That portion of the old adage, "that fools build houses," etc., is fully exemplified in most cases when people pay their money to some *preacher* of the "first-class" doctrine, who makes his way through life by *practicing* "first-class" deceptions. The man who intends to cheat and defraud is quickest to parade his "first-class" promises, and those who talk most about their "first-class" abilities are generally the least qualified to do anything correctly. The term certainly means superiority; but there are tens of thousands of things done and sold as "first-class" which do not possess a single superior quality. It is used in common practice as a decoy—a cloak or covering so elastic in character as to fit anywhere and everything—and those who are deceived by it simply expose their innocence and inexperience, if not their weakness and want of common sense.

Those who build houses on speculation, and save in their construction every dollar there can be saved without prejudice to disposal, and who almost scrupulously avoid everything of really first-class character, never attempting to introduce more than the absolutely necessary and feasible, will fairly *swear* that such buildings are "first-class," built by day's work, etc.; in all of which there is but the one purpose—to sell. And we rather strongly incline to the opinion that there are but few of that race of people living now who used to consider it a sin to lie; and the form which the new departure in moral rectitude assumes is shaped altogether by the circumstances surrounding. The general rule of restraint is limited to the gravity of the occasion. If a little twisting will serve the purpose, it is made to answer; but when "great big whoppers" are necessary, the majority of people are not afraid to resort to them.

Many also *seek* deception. The larger number of owners of property contemplating the erection of buildings, if they happen to interview a qualified and capable architect who talks of matters and possibilities intelligently and practically, become scared at the actual facts presented, and go in search of some pretender, who at once begins to talk "first-class" everything, when nothing better than the slop-shop standard is either contemplated or understood by him. Still his *talk* is "first-class," inasmuch as it serves to deceive the party who prefers deception to facts; and the sequel in innumerable cases has been attended with irremedial regrets to those who have danced to the music—"*first-class.*"

The same rule runs through all lines of mechanical operations, and in all classes of dealings. The man who attempts to sell an article, and has the temerity to suggest the possibility of defects, will often miss a sale; while his neighbor who recommends identically the same article as *first-class* will find ready customers.

Thousands of *really* "first-class" goods, wares, and merchandise are known and protected by the producer's "trade-mark" and "label," and those who desire the standard articles are governed thereby in their purchases. But the teredos in business bore into the sound timbers of trade, and basely imitate the "trade-mark," by which they dispose of terrible impositions as "first-class"—original; and the masses of purchasers who are governed only by the sense of cheapness seek the imposition, rather than exercising good judgment and finding, and being willing to pay the price for, the genuine.

In architectural and mechanical pursuits, it may be safely accepted as a rule, that those who in reality enjoy "first-class" qualifications refer to "first-class" buildings and workmanship cautiously, knowing that the term implies much more than one in five hundred desire to pay for; while the lesser classes, who understand absolutely nothing about the practical application thereof, resort to its use for the purpose of deceiving and cheating. During our practical, and by no means limited, experience, we have proven the rule as invariably correct, to doubt if not despise every boaster of "first-class" qualification, not one in a thousand of whom could, if their lives were the penalty of failure, define the proper meaning of the term "first-class" in house-building.

Injurious Resorts.

With no intention to overstep the legitimate lines which should control in the conduct of a journal of this character, and recognizing that the moral aspect of the subject-matter alluded to may not be strictly in keeping with its special purposes, we nevertheless feel justified in noticing the matter referred to, in the light of its damaging effects upon the young mechanics and working-men generally of this city. Our mission is to elevate and ennoble mechanical as well as architectural pursuits, and to rebuke, as far as our influence may extend, everything of evil character calculated to demoralize and work harm to those whose best interests we profess and hope to serve.

The matter alluded to is the almost innumerable lager-beer cellar resorts which abound in San Francisco. It is painful to contemplate the work of moral, mental, and physical degradation and destruction which is nightly conducted in these places, designated by various classic, poetical, patriotic, and fanciful names, and surrounded within and without by all the allurements which uncultured men can conceive, to allure the unthoughtful to low revelries, falsely denominated pleasures.

It is no matter of surprise that the low-minded, vulgar, and unrefined should seek these places, and accept as pleasurable the low order of vulgarities dealt out as amusements; but it is both astonishing and lamentable that so many men, young and old, who are qualified by nature and intellect to aspire to and attain a much more refined and elevated manhood, should settle down into and encourage by their presence and applause that which, in every tendency and influence, is demoralizing and injurious to the intellectual, moral, and physical nature. Apprentices, journeymen mechanics, and working-men of all classes should remember and contemplate the fact, that earnest study—mental and moral culture—is the only sure road to pre-eminence in any line of art or mechanism, and that every hour wasted under influences calculated to contaminate and corrode the better sentiments of mind and heart is just so much of positive loss.

The injuries imposed by these places are manifold—the two prominent being, first, the physical and moral effects upon the parties themselves. The breathing of "cellar air," air naturally impure, and rendered still more so by the heat and smoke emitted from gas and other lights, with impurities increased by repeated use—passage through human lungs, only to be thrown out and again re-breathed—and all this intensified by the smoke and fumes of cheap cigars, sold "5 to 10 for a quarter"—the offensive odors of clothes impregnated with grease and other substances, which would require many days of sunshine, if they were exposed thereto, to remove the smell and purify them—these must and do work terrible injury physically, while the blasphemies, vulgarisms, low jests, and indecent conversations indulged in are equally injurious to morals and the finer sentiments.

Secondly—Those who thus spend the hours of evening, and more generally until the clock strikes twelve, or later, must and do become less qualified for the duties of the succeeding day. From weariness and want of proper rest, both the physical and intellectual powers are enfeebled, and the labors of the succeeding day are performed with a burdened sluggishness, sometimes amounting to a hatred of life itself.

In view of these things, and the many others which naturally enter into an extended review of the subject-matter under notice, we appeal to the mechanics and working-men, and especially to the apprentice classes and youths of our great city, and of all other cities and places where this journal is read, to reflect upon and measure the value of what we have stated; and as they hope for advancement and comfort here, and a better life beyond, to turn away from every place and pleasure, as from a great and dangerous evil, which is calculated to impair or imperil their better manhood and morals, and to seek those which in effect shall improve and ennoble every emotion and sentiment of the soul. Seek the good, for the jewels which adorn life are only found in the paths of prudence and virtue.

Selecting Timbers.

Rankine says that there are certain appearances characteristic of good wood, to what class soever it belongs. In the same species of wood that specimen will in general be the strongest and the most durable which has grown the slowest, as shown by the narrowness of the annular rings. The cellular tissue, as seen in the medullary rays (when visible), should be hard and compact. The vascular or fibrous tissue should adhere firmly together, and should show no woolliness at a freshly cut surface; nor should it clog the teeth of the saw with loose fibers. If the wood is colored, darkness of color is in general a sign of strength and durability. The freshly cut surface of the wood should be firm and shining, and should have somewhat of a translucent appearance. In wood of a given species, the heavier specimens are in general the stronger and the more lasting. Among resinous woods, those which have the least resin in their pores; and among non-resinous woods, those which have least sap or gum in them—are in general the strongest and more lasting. Timber should be free from such blemishes as "clefts," or cracks radiating from the center; "cup shakes," or cracks which partially separate one layer from another; "upsets," where the fibers have been crippled by compression; "wind-galls," or wounds in a layer of wood, which have been covered and concealed by the growth of subsequent layers over them; and hollow or spongy places in the center or elsewhere, indicating the commencement of decay.—*Mining and Scientific Press.*

An enormous amount of railway construction is now in progress in this country. It is estimated that 8,000 miles will be added to our railway system this year, against 7,174 miles last year. If all the projects now under way are completed, next year will see a still greater addition. The list of railroads now under construction comprises 15,886 miles of new road, to be completed by October 1st, 1882, which would make about 12,000 miles to be built next year. Most of these new roads are in the Southern and Western States. *Bullion*, in commenting on this enormous increase, says: "If the nearly 16,000 miles of road proposed to be constructed will cost, say, $40,000 a mile to build, making an aggregate cost of $640,000,000, and that enormous sum will pay a fair income yearly, the principal, though sunk, is not wasted." In 1880, the 84,225 miles of road in operation in this country paid on their aggregate capital dividends to the amount of over 3 per cent.—*Industrial News.*

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

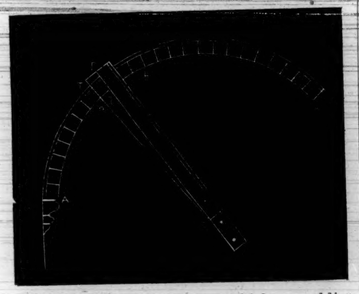
[While this column is open to all, farmers as well as mechanics, engineers as well as architects, we would call particular attention to one and all to have their questions and the information desired to be in accord, as far as possible, with the interests of this journal and for the carrying out of those principles for which the only monthly of its kind this side of the continent, was established. We will endeavor to answer all questions in a fair and impartial manner, and if it becomes necessary, will furnish cuts for the illustrations of any problem, provided we regard the solution thereof as beneficial to the majority of our readers. We would urge upon our patrons the necessity of being pointed in their questions, concise in the language used; let the writing be distinct, and one side of the paper only to be used; give full name and address, and particularly mention if their proper name shall be used.

We want it distinctly understood that the responsibility of signed articles rests with the authors.

Correspondents will please direct all communications to the business manager of this journal—240 Montgomery street, rooms 12 and 13.]

BUSINESS MANAGER OF ARCHITECT: In putting on a molding around a circular head of a window, it is necessary, of course, to kerf the molding in order that it may bend without breaking. Is there any rule by which we may know just how much solid wood to leave between each kerf? G. F., Healdsburg.

ANS.—There are many solutions to this problem, but for simplicity and exactness, the following rule, by the author of MECHANICS' GEOMETRY, is better than any other which I can at present call to memory:



"Let A B C be a curve to which a molding or other work is to be bent: Supposing the stuff to be one inch thick, take a strip equal to this, and run a gauge line on to the thickness of a veneer; then make a cut down to veneer. This done, lay a strip on the drawing, keeping the cut opposite S the center of the given curve. Fasten the lower part of strip; its face is now on line S P. Move it to the left until cut at S closes, which causes its face to be on line S T and gives for solid wood between each kerf 2 3. Here it must be kept in mind, that the same saw with which the cut was made in strip must be used for kerfing the work."

BUSINESS MANAGER OF ARCHITECT: I have always noticed that the ends of the joist in a brick building are always beveled where they rest on the walls. Is there any prarticular reason for such bevel? PROPERTY OWNER.

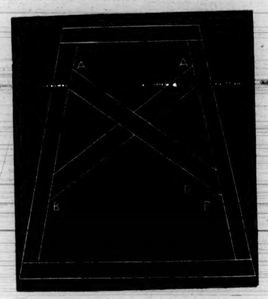
ANS.—One of the principal reasons is, that in case of fire the joists may burn and fall out without pulling the wall down. Also in case of long spans, the *springing* of the joists will not endanger the wall.

BUSINESS MANAGER OF ARCHITECT: What is a lancet window? By answering you will oblige a workman in SAN MATEO.

ANS.—It is a narrow window with acutely pointed arch head. Seldom used except in churches.

BUSINESS MANAGER OF ARCHITECT: What is the rule for finding the length of braces between two posts, when they incline one foot in six feet rise. L. R., Berkeley.

Our correspondent is rather indefinite, but we think the following will explain his wants:



The cut represents a frame, the posts of which inclines one foot in six feet rise. Let the distance B B represent seven feet. The braces are run at an angle of 45°. The post inclining one foot in six, leaves the distance at A A six feet. We have given the rule in a previous number. In this case the brace would be 8 ft. 5 13-16 inches.

The New Odd Fellows' Hall.

Some months since the building committee of the Odd Fellows' Hall Association issued an invitation to architects to compete for the plans for a new building, to be erected on the lot forming the southwest intersection of Market and Seventh streets.

The premiums offered were respectively $500, $300, $150, for the three best plans. The size of lot is 150x165. The limit of cost was fixed by the committee at $200,000.

Six architects competed: Messrs. Wright & Sanders, McDougall & Son, W. Schrof, J. J. Newsom, Newsom Bros., and P. Portois. The plans presented by Wright & Sanders were awarded the first premium, McDougall & Son the second, and W. Schrof the third.

As yet, the committee have not fully determined upon the course to be pursued in reference to the plans, as modifications affecting cost and the arrangement of building may be found advisable.

The matter will likely be fully settled at an early day, as it is the intention to commence operations during the spring months, provided a satisfactory disposal of the old property can be effected.

The Tensile Strength of Glass.

Traulionie gives the tensile strength of glass at from 2,500 to 9,000 pounds per square inch, according to kind; crushing strength 6,000 to 10,000 pounds per square inch; transversely, by his own trials, Millville (N. J.) flooring glass, one inch square, and one foot between the end supports, breaks under a load of about 170 pounds, consequently it is stronger than granite, except as regards crushing, in which the two are about equal. It is suggested that glass will shortly be used for many purposes where other and much inferior materials are exclusively employed. Glass may be used as water conduits to better advantage than cast-iron or terra cotta, as it is impervious to moisture, and proof against corrosion or chemical action. It is already considerably in use for flooring, and it has lately been successfully experimented with for railway sleepers under exceptionally severe conditions.—*Mining and Scientific Press.*

Illustrations.

Plate A. As promised in our December issue, we present in Plate A the design of the "Tabor Grand Opera House and Hotel," Denver, Col. It is unnecessary for us to add more at this time in reference to this handsome edifice, as a very full description was given last month.

Plate B represents a neat and not costly design for a country residence, the plans for which are shown by *Plate C*. It contains, besides halls and bath-room, eleven rooms, including library off of parlor and dining rooms, 7 ft. 6 in. by 11 ft., and children's or dressing room on second floor, off of main chamber, 7 ft. 6 in. by 9 ft. 6 in., with laundry, pantry, and closets additional. The plans were prepared for erection at Reno, Nevada, for Mr. R. L. Fulton, of the *Reno Gazette*. Its cost, complete, erected in a good and substantial manner, may be fixed at $4,500, with the contingency of something less, if plainness and cheapness of finish are observed, and twice or thrice that amount by the adoption of expensive finishes.

Plates D and *E* represent a convenient one-story cottage, capable of erection anywhere from $1,600 and upward, according to manner of construction and other circumstances.

We repeat what has been frequently stated in this journal, that the margins in cost of buildings are large, varying from ten to five hundred per cent. for those of similar size and convenience, the enlarged cost being in the class of materials and finishes employed, and the grade of workmen engaged. Some house-builders *throw* work together, while others execute it in a skillful and workman-like manner; and those who desire good work can only obtain it from the hands of competent men, while those who want what is known as cheap buildings, *i. e.*, those that cost the lesser amounts, can best serve their purposes by employing the *botches*, as far as first outlay is concerned. But experience has fully established the folly of shoddy workmanship and material in house construction. Far better to contract with responsible and good contractors, as after expenditures for repairs and keeping things in order outweigh all first considerations of economy.

Owners may rely upon this as a fact, that the class of architects and builders who indulge in representations of their abilities to effect great results at small cost, mean simply that they are adepts at producing inferior building, and deceiving those who have had but little experience in house construction. The "*Cheap Johns*" in any line of operations do not deal in things of intrinsic value, but at the same time will swear that the *trashy* things offered by them are *first class*.

Cotton and Straw Houses.

It is said that fire-proof houses can be built of cotton and straw. In preparing these materials, raw cotton of inferior quality, the scattered refuse of plantations, and sweepings of factories are mixed and converted into a paste, which becomes as hard as stone, and then is called architectural cotton. It may be made in large slabs, whereby the building of a house would be rapid in comparison with the practice of laying brick after brick, and at about one-third the cost. For the other part, wheat straw is treated in a way already known, and converted into pasteboard. The sheets thus prepared are soaked in a solution which hardens the fibers, and they are then compressed under enormous power into beams and boards of any required size. The effect of the soaking is said to render them difficult of combustion.—*Southern Manufacturer and Builder.*

GROUND PLAN FOR ONE STORY COTTAGE.

Leaky Roofs.

There can be no other excuse given for leaky roofs than absolute carelessness or bad workmanship, except in cases where the materials of which they are constructed have yielded to the laws of wear and tear, and fail longer to serve the purposes for which they were originally intended. If the roof work of buildings is properly executed, they should remain perfectly water-tight so long as the material will last. Yet it is a common occurrence that leaks develop themselves with the first rain that falls after their completion, and more or less tinkering is found necessary, for the reason, that when work of any kind is defective in its first execution, continual repairing or renewal as a whole becomes a necessity.

Under such circumstances, owners are apt to complain, and feel almost revengeful toward the parties by whom the work was done; and in an abstract view of the case, such feelings are sustained by the provocations experienced. But behind this there is another fact, which seldom enters into the consideration; and that is, that owners are more generally guilty of very unwise procedures in the premises, in practicing the almost universal rule of seeking *cheapness*, and *presuming* competency on the part of cheap workers; while all the facts in mechanical operations demonstrate the utter impossibility of obtaining good things at a low price, except by mere chance. Cheapness and good quality do not run in the same channel. And it is only so far as owners are careful to engage or enter into contract with thoroughly competent mechanics—aiming more to secure good work than to save a few dollars in expenditures—can they reasonably expect to obtain good work, either in roofs or anything else. This is as true in reference to building houses as it is in relation to goods and merchandise; and so long as owners follow the practice of admitting botches in competition with competent mechanics, and accept their low estimates with favor, making no distinction between mechanics in a proper sense and *mechanical frauds*, no right or intelligent cause of complaint can exist. If men undertake to do work for ten or twenty per cent. less than a right and paying price, it is but natural that they should seek to compensate the discrepancy by doing the work undertaken in quality on a par with the price for which the work is undertaken. And more than this, there are thousands who call themselves mechanics, who could not, if paid ten right prices, execute good work.

We do not justify this course on the part of mechanics, but it is a natural and rational sequence, under the order of things that prevail; and neither imperfect roof work nor any other class of work is to be wondered at. If the rule prescribed the lesser class upon the basis of lack of competency, instead of good men, because of higher demands for more perfect and valuable services, the condition of things would be changed, and in the long run to the advantage of those having work done at a fair price, as the after expenses made necessary by poor workmanship would in many cases more than compensate the difference in first execution.

We assert it as a fact, beyond successful contradiction, that roofs in all cases can be made entirely impervious to the rains, and that all leaks in them result from the causes enumerated—except that occasionally, men who receive a proper compensation, and claim to be good mechanics, are possessed of the mean disposition of excessive greed, and sometimes do "rascally things" for the sake of enlarging the sum of profits on their operations. But under no circumstances does there exist a single good reason why the roofs of buildings should not always be entirely water-tight.

It is also true that the party selected as architect may possess no really practical knowledge of roof work, nor of any other feature of practical construction; but this fact does not excuse the mechanic for defects in workmanship. Neither ugliness of design nor inconvenience of arrangement precludes good work; and if the architect in the superabundance of his stupidity shall have betrayed his total unfitness, as many do, to perform architectural services, the mechanic is not thereby relieved from the faithful performance of his duties. In some parts of the world the mechanic is held to strict accountability for defects, although he may have faithfully followed the instructions and requirements of plans, specifications, details, and the personal orders of the architect—the presumption being that those who undertake the construction of buildings as "master mechanics" understand more completely the necessities involved; and the laws do not permit the shifting of responsibilities from those who *do* to those who *direct* the doing. We wish it were so in this country, as such laws would drive away from the architectural profession thousands who assume its practice, without any of the qualifications necessary to a fair or perfect knowledge of its great and grand principles, theories, and practical demonstrations; and with them would go thousands more of men who use mechanical pursuits as means by which to make money, while in fact mechanical science is to them as little understood and as mysterious as would be the dead language to an untutored heathen.

The Agricultural Ant in Texas.

The existence of ants who carried on some of the processes of agriculture was known as far back as the time of Solomon, as proved by the well-known passages in the Book of Proverbs, in which he praises their exceeding wisdom, and bids the sluggard to consider their ways; but as investigations of the habits of European ants led to the discovery that they none of them make provision for winter use, for the good reason that as they hibernate they do not require to do so, it came to be believed that Solomon had only adopted a popular fallacy; modern research has, however, proved that, after all, Solomon was correct, for there are two species inhabiting the countries bordering upon the Mediterranean that harvest seeds, and now we have from the other side of the Atlantic a full description of the mode of life and operations of farmer ants. Mr. McCook, a Presbyterian minister of Philadelphia, provided by the liberality of his congregation with time and means for careful investigation, records that the *Pogonomyrmex barbatus* of Texas carries on what may be well and justly called "farming," like a true backwoodsman. As soon as a new colony is founded, the settlers proceed to clear the ground. This they do by biting through the stems of the grasses, allowing them to wither, and then pulling up the roots, and having cleared a circular space varying in diameter from one to ten feet, according to the strength of the community, this is afterwards kept free from all growth save of one particular species of grass, the seeds of which form their favorite food. It has been surmised that they sow the crop, but Mr. Cook's investigation failed to establish the proof of this; but they do not rely solely on the produce of their own clearing, but make diverging roads—in some cases upwards of 60 feet in length and 2 inches in width—into the surrounding jungle, and send out foraging parties in search of various grass seeds. These are borne home and deposited in their subterranean dwellings, the work being carried out from early morning till sunset, but with a rest of some hours during the heat of the day, when the busy workers retire underground for protection from the sun's rays. They possess advantages and disadvantages as compared with the human worker, one advantage being that they always carry their tools, reaping-hooks and rakes, with them, whilst the disadvantage is that these implements once injured cannot be replaced. This is graphically portrayed by a row of toothless queens. Their care of the garnered stores is shown by their careful drying on the surface of their nests of grain, which has been rendered damp by an inflow of water, and their rejection of grains which may in consequence show symptoms of sprouting.

The clearings affected by these industrious insects sometimes seriously interfere with man's culture of the land, and he is driven to waging war with them. Repeated plowings of the surface fail to extirpate them, and recourse must be had to poison or to traps. Nor are they destitute of the means of defense, as the pain inflicted by the sting of these emmets is equal to that caused by a wasp's sting.—*Journal of Applied Science.*

If in the past, in the conduct of this journal, we have in anything erred, or been unjust or unfair toward any one, we shall frankly acknowledge, and as far as may be in our power correct, every act of unfairness or injustice, so far as they may be made to appear. We have had neither enemies to punish nor friends to serve, in the past, and shall strive to maintain in the future a faultless integrity in everything appearing in this journal. Inspired in our editorial work by neither envy, jealousy, nor malice in any connection, it will always be more pleasing to make favorable and kindly references to matters and things in general; but duty will compel us to even severe criticism of such as may be irregular, harmful, and monstrous in character. We have and shall dispute the right of any architect to pursue professional practices which shall tend to demoralize and disgrace the profession as a whole. And we regret the fact that there are some in San Francisco, disguised as architects, who do reflect discredit upon an honorable profession, and by their unprofessional course, and ignorance of all correct understandings of the science of architecture, bring *upon the profession* reflections among property owners which work injury to good and competent men. And we also regret that there exists among mechanics, in the various branches, a much too general undervaluing of correct principles; an inclination as much to succeed and prosper by intrigue and cunning device and scheming, as by honorable and square dealings.

Seeking and securing advantages by the lesser, instead of assuming the higher and better, courses of action, is more the rule than the exception. And to such an extent has this disposition grown in California, that scarcely anything that will *win* is considered by the majority too monstrous for application. Consequently there will necessarily arise cases which will demand severe comment from us, and we shall deal with them plainly, for the sole purpose of correcting the wrong and defending the right; at the same time, not forgetting that perfection is not possible in men, and that the best may err. But if with one accord, and with strong earnest purpose, each and all shall aid in checking the impure currents in both architectural and mechanical pursuits, it may confidently be anticipated, that in the future better conditions and increased benefits will be enjoyed by all.

The mechanic who reads a paper published in the interests of the trade he is engaged in is sure, in the end, to command better wages than the workman who plods away in the same old ding-dong style of his forefathers, and takes no paper pertaining to his trade. It is easy to pick out of a shop the men who read from among the workmen. The well-read man gets all the best work, greater pay, and is nearly always constantly employed, and he deserves these advantages, for his extra readiness is sure to be a source of profit to his employer.—*Builder and Wood-Worker.*

Some Great Engineering Projects.

The shortening of commercial routes by means of ship railways and ship canals seems to be the great ambition of the engineers of to-day.

In addition to the De Lesseps ship canal at Panama, the Eads ship railway at Tehuantepec, the Florida ship canal, the Chesapeake and Delaware ship canal, the Cape Cod canal, and others in the interior of this country, there are several other important projects of like nature under way or in prospect in various parts of the world. The old project of connecting the bay of Fundy and Baie Verte, on the Gulf of St. Lawrence, across the Isthmus of Chignecto, has lately taken new form. It is now proposed to make the connection by a ship railway eighteen miles long, thus making a short cut for navigation between the United States and the ports on the St. Lawrence gulf and river, and saving the long and dangerous voyage around Nova Scotia.

The projector of the ship railway, Mr. H. G. C. Ketchum, writes us, that the plan grew out of a desire to save lockage and a deep channel in the design of the Baie Verte canal. His first plan was to lift vessels by hydraulic power on pontoons, and then float them through the canal. The idea then occurred, that they might as well be lifted to the surface of the ground, and hauled across the neck of land on rails. The road may be level and perfectly straight from end to end. The plan has been submitted to the Dominion Government, and is favorably entertained. Mr. Ketchum has issued an interesting pamphlet relative to the project, which may be considered at greater length elsewhere.

Across the ocean, the construction of the tunnel under the British channel, connecting England with the continent, is being prosecuted with an energy which is indicative of ultimate success, and thus far no obstacles have been encountered to make the undertaking a difficult or exceptionally hazardous one.

In France, the connection of the Atlantic with the Mediterranean by a ship canal, to save the long and stormy voyage around the Spanish peninsula, is under serious consideration, and the Council-General of the Seine have just adopted a resolution approving of the project.

The ship canal across the Isthmus of Corinth, in Greece, to shorten the route to Constantinople and the ports of the Black Sea, has, we believe, been definitely determined upon.

In the far east, a bolder and more important project is in contemplation, with a view to shortening the commercial route to China and Japan by 600 miles or more. At the head of the Malay peninsula is the Isthmus of Kraw, connecting Upper with Lower Siam; and by the cutting of a ship canal at this point, about 30 miles in length, the need of sailing around the peninsula might be obviated. At Kraw, the Malayan peninsula, which stretches southward for 500 miles to Signapore, is at its narrowest breadth, and the distance across from the side of the Indian Ocean to that of the China Seas is further decreased by the existence of natural water ways for some distance inland from both shores. From side to side, it is no more than 50 miles, and the Pakchan River, on the western coast, and the Htassay on the eastern, afford the ready means of further reducing it. The distance, therefore, over which it would be necessary to cut a canal would probably not exceed 30 miles The neighboring districts are known to be fertile, and to contain great mineral wealth. A tin mining company has been established for more than ten years at Malewon, on the Pakchan, and gold has been found in the neighboring stream of the Lenya. So far as known, the engineering difficulties are not of a stupendous character, and political drawbacks and considerations fortunately do not exist.

The French appear to have taken the lead in proposing this important commercial short-cut, and if the opinion of the London *Times* is well founded, the Government of British India will not decline to actively participate in its execution.—*Scientific American.*

Texas Coal and Iron.

As Texas has never yet had a geological survey, the extent of her coal strata is not well defined. It is supposed, however, to embrace about thirty thousand square miles, in the northern and western portions of the State. Over this great area, coal has been found at a great many places, but at no place has it been mined except to a very small extent. It is a bituminous coal, and almost, if not quite, precisely similar to the McAllister coal of the Indian Territory. Some anthracite has also been discovered in this coal territory. The railroads are now penetrating the coal formations of Texas, and this great source of wealth will now doubtless be rapidly developed. So far, it is a virgin field.

In addition to the true coals of Texas, there is an immense bed of lignite, which extends apparently across the entire State from northeast to southwest, in the eocene formation. It is said to be at some points twenty feet thick. This lignite much resembles cannel coal, and doubtless would be made quite equal to it by a process of pressure by machinery. It is very fat in various oils and gases.

Texas is peculiarly blessed with iron. In eastern Texas, there are immense deposits of hematite or brown oxide of iron. It runs through many counties, often forming high hills, which are literally filled with it. These ores contain from forty to seventy-five per cent. of metal. In some places they are worked to some extent. The region in which these ores are located is heavily timbered; so that charcoal for reduction can be had at a nominal figure. The iron turned out is of excellent quality. In Robertson, Limestone, and other counties of central Texas, the same quality of ores exist, and generally in close proximity to immense beds of lignite. But perhaps the grandest accumulation of iron ores in Texas, and probably anywhere else, are in Llano and Burnett counties. It is here in connection with primitive rock, and appears mostly as magnetite. It rises out of the granite in immense seams and dikes. It has been wrought to a small extent, and found to yield from seventy-five to ninety per cent. of metallic iron, equal to the best Swedish. There is plenty of timber for charcoal and limestone for flux. Besides, coal has been found near by, and it is known to be abundant a little farther to the north. Soapstone is abundant in the same localities, valuable for furnaces.—*Chattanooga Tradesman.*

Mr. Warren H. Williams, well-known to the architects generally in this city, paid us his usual annual holiday call, on the 5th inst. We were pleased to see him in person, and exchanged congratulations and good wishes for mutual continued health and prosperity. As is well known, Mr. Williams is practicing the profession at Portland, Oregon, with marked success. He reports gratifying prosperity at Portland during the past year, and a favorable outlook for 1882. In his behalf, we state to those of his large circle of friends in this city upon whom he failed to call, that an early return to his field of labor rendered it impossible for him to extend his personal visits as much as he desired.

In common with all the older established architects in San Francisco, we entertain the most kindly feelings toward the gentleman named, he being the son and student of one of the most worthy, in his lifetime, and highly esteemed members of the profession, whose death was chronicled in Volume I. of this journal.

The Female Inventors of Antiquity.

Netocris, the spouse of Nebuchadnezzar, is described by M. Baudrillart as the soul of his works, and to her is attributed the design of the lake named after her, which served the double purpose of a fortification, and a dam against the Euphrates when in flood. The famous hanging gardens are also attributable to female influence: to the longing of a Median princess, born in a more elevated region, for the coolness and shade of her native mountains. There were five of these gardens, about four English acres each, on terraces supported by columns, and covered with mold thick enough for the largest trees to take root in it. One of the columns was hollow, and contained a hydraulic machine to raise the required quantity of water. In fact, the art of gardening, with all its modern appliances, including irrigation and the transplantation of grown trees, was practiced in Babylon as effectively as in the Bois de Boulogne or Hyde Park. The Roman writers speak of silk as a product of India, and it was unknown in Europe, except as an imported and rare article, prior to the sixth century; but the Chinese claim for an empress named Siling-Chi, who lived B. C. 2650, the discovery of the art of breeding and domesticating silkworms, that of winding off their cocoons, and the fabrication of stuffs of silk. She was deified as the discoverer in the threefold capacity, and down to our time, according to M. Baudrillart, the Chinese empresses, attended by their maids of honor, have been in the habit of making annual sacrifices to Siling-Chi, and have deemed it a duty to rear silkworms. The export of the seeds of the mulberry tree and the eggs of the worm was prohibited under pain of death, and the prohibitory law was rigidly observed for ages, till a Chinese princess, bethothed to a king of Khotan, unwilling to dispense with silk, contrived to smuggle some of the seeds and eggs across the frontier in her hair. But the secret did not reach Europe till A. D. 552, when two monks of the order of St. Basil made a present to Justinian of some of the seeds and eggs, which they brought from China in the hollow of their pilgrim staves.—*Quarterly Review.*

How to Obtain this Journal Free of Cost.

To any of our subscribers or other parties who will forward to this office four new names in addition to their own, and *eight dollars in cash* or by postal money order, bank check, or other circulating medium, we will send this journal for the year 1882, and a copy of the *Steel Square and its Uses*, free of charge. Single subscription price, $2.00 per annum; steel square and its uses, 75 cents.

Or we will furnish *ten copies* for one year, sent to separate addresses, for *fifteen dollars* to the parties securing the ten new names; in addition to which we will send or give a copy of *Palliser's Useful Details*, price $3.00, or either *two* of the following named books: "Palliser's Model Homes," "100 Useful Designs," "Stepping-stone to Architecture," "Practical Draughtsman," "Proportions," or "Saw Filing."

To Imitate Black-Walnut.

A new process by which ordinary wood has imparted to it the appearance of walnut, suitable for office, steamboat, and other cabinet work, has been recently described. Birch, beech, alder, or similar woods, are first thoroughly dried and warmed, then coated once or twice with a liquid composed of one part by weight of walnut peel, dissolved in six parts of soft water, by heating it to boiling, and stirring. The wood thus treated is, when half dry, brushed with a solution of one part by weight of bichromate of potash in five parts of boiling water, and, after drying thoroughly, is rubbed and polished.—*Druggists' Circular.*

Retrospect.

In looking back over the course of prices for the past year, there has been nothing discouraging to the legitimate dealers in real estate. There has been no extraordinary advance, but property in every part of the city has been firmly held, and scarcely any losses can be recorded against those who bought wisely. It was supposed that the great rise in the stock market during the fall and winter of 1880 and 1881 would lead to an excited real estate market during the spring of the latter year; but such did not prove to be the case. At no time during the year was there any evidence of a general speculative movement. Property has been very firmly held in the business and fashionable quarters of the city. If there has been any disappointment, it has been in the lack of interest in West Side property, especially on the Riverside Drive and the streets adjacent.

The past year has been distinguished by a very great building movement. The Nineteenth and Twelfth Wards have increased, of course, more largely than any others. The new building has followed the line of the backbone of the island, that is, up Lexington, Madison, and Fourth avenues. A notable building movement is that which has sprung up on the flat grounds above One Hundred and Twenty-fifth Street. It is evident that the building activity for the coming year will be largely in that direction, and that the time cannot be far distant when all the low-lying ground north of the Central Park up to the Harlem River will be covered with houses.

One of the special features of the building of the past year has been the construction of immense buildings for offices on the lower part of the island and of great apartments and flats on the central zone of the city. The use of the elevator is changing the architecture of New York. While less space is being taken up, buildings of greater hight are everywhere in course of erection. This change in our method of house construction bids fair to make New York in the course of time the most densely populated city in the world; that is to say, it will have the greatest number of inhabitants to the square mile. There seems to be no end to the demand for suites of rooms. Apartment houses cannot be erected in sufficient numbers to supply the demand.—*New York Real Estate Record.*

Our Redwood Proposition.

We of less experience than our veteran brethren of the pen and press, who have passed over the shoals and snags of early training, sometimes fail to make our intent and meaning so clear and plain as to preclude misconstruction by others.

The Humboldt *Times* takes us to task as follows:

"The California ARCHITECT will publish a series of articles early in the year on the redwood and its uses. It informs its readers that many erroneous notions exist about this tree and lumber, which it hopes to correct from an experience of more than thirty years. The ARCHITECT asks its contempories to "reserve further statements in reference to this matter until its articles are printed." When we reflect that there are thousands of men in various callings who have known nothing but redwood for a quarter-century, we are inclined to think the announcement is a shrewd advertising dodge. In this county it is well known that redwood is used for building anything and everything from a board fence to a fortune. The particulars will not be eagerly sought for."

Our contemporary exposes an aptness to jump at conclusions; and if in all cases its leaps are as distant from the correct as in our case, its course must be as irregular and circuitous as the Northern Pacific Coast Railroad. There was not the slightest attempt conceived on our part at "a shrewd advertising dodge," nor did we propose to furnish any new light upon the redwood question to those who live in or near redwood forests, and are so thoroughly familiar with all the facts of the case that they cannot be further informed.

We had in mind the simple purpose of correcting erroneous statements which have appeared in several Eastern journals in reference to California redwood.

We trust that our good brother of the *Times* has been one of those who has reaped a "fortune" from the use of redwood, and if he has not, we hope that fortune will smile upon him, and strew the remaining portion of his life's pathway with as many golden eagles as there are redwood trees around or in sight of his *sanctum sanctorium*.

Thirty odd years in the practical use of California's most prominent wood, for all purposes for which it is used, including proprietorship in a "redwood sawmill," erection of buildings, etc., etc., certainly furnishes us a basis upon which to found the conclusion of competency to "know whereof we speak."

Machinery and Mechanical Skill.

The wonders of mechanism, says the Boston *Journal of Commerce*, have furnished material for essays, anecdotes, sketches, for lectures and lessons without number. The close imitation of sentient human judges by insensate material when formed into acting machinery; the microscopic wonders of production in watch-making machinery—screws so small that to the unaided eye they appear like grains of minute seeds; the automatic handling of metals in process of conversion from mass to individual shapes; the exact reproduction of periods of time or of acts by machines which count, and register, and measure, and return;—all these are admirable and admired.

But the skilled workman makes possible the wonder-working machine. He must first make the initial screw, the first wheel, form the first gear tooth, lay out the first congeries of levers, inclined planes, rotating wheels, and reciprocating movements that make a completed machine. It should always be borne in mind that the machine never improves itself; it is simply a reproducer; and even to continue to be a reproducer it must have its own waste supplied and resupplied by continual additions made by the trained hand, backed and guided by the intelligent brain. So, when we are inclined to argue the progress of the race by the achievements of machinery in our day, let us never forget that these achievements are not only primarily the outgrowth of individual human skill, but must also be kept up to their present standard by individual human skill; and that no progress whatever can possibly be made without the perpetual presence and active operation of the skill of the individual workman.—*Leffel Mechanical News.*

Green and Red Lights in Vegetation.

Why will grass not grow under our trees? M. Paul Bert has shown that green light hinders the development of the plants. Plants inclosed in a green glass frame wither and die as though they were in darkness. M. Regnard finds that plants epecially require the red rays. If sunlight is deprived of the red rays, the plants soon cease to thrive.

Send for a copy of the "Steel Square and its Uses," handsomely bound and illustrated. Price, 75 cents.

The Boston Society of Architects, with whose co-operation the recent test of fire-proof building materials was made in that city, not satisfied with the information obtained from the first trial, has taken steps to secure, if possible, a second and much more comprehensive test, in which the different kinds of fire-proof construction shall be subjected to strains such as they would endure in actual practice, and each material shall be used over a considerable surface, and exposed to a fierce and long-continued heat, the fire being kept up, if possible, until all the varieties of construction have succumbed. By the side of these, and subject to the same conditions, it is proposed to place one or more examples of the ordinary so-called fire-proof structure, consisting of naked iron beams, carrying brick arches, and supported by unprotected cast-iron columns, as well as corrugated iron-work, with and without concrete filling, brick vaults and various kinds of fire-resisting shutters and doors. The subject is one of vital importance to all who own or insure warehouse, office, or banking buildings, or the property contained in them. At this moment, the United States Government has some fifty millions of dollars invested in freestone or granite piers and unprotected iron columns, supporting bare wrought-iron girders, which in their turn carry the brick arches of the floors and roof; and private individuals in the city of New York alone have about as much more; yet the unanimous opinion of experts, sustained by some private tests, is that in point of security against fire these costly edifices are little better than frames of timber and plank, and far inferior to timber frames covered with wire-cloth and plastered. The accumulation of costly goods in our great cities is now so enormous that it has become a matter of imperative necessity to discover some mode of constructing buildings which can be depended upon to contain them safely. Scores of patentees claim to have solved the problem, but a thorough comparative test of the various inventions has never been made, and it would be much for the interest of all underwriters, owners, or lesses of buildings for the reception of valuable goods to respond to the appeal of the Boston Society of Architects, and contribute toward the fund which must be raised before the project can be carried out.—*The American Architect and Building News.*

Slate and Glass.

The problem as to the best material for building purposes is, perhaps, as remote of solution as ever. But we notice that considerable discussion is being had in this matter, and two articles, not generally esteemed worthy of mention in connection with the subject, are coming to the front. These are slate and glass. It is said that the former is a good substitute for marble and granite in public buildings. Builders assert that slate is more lasting than either marble or granite, and is impervious to heat. Slate, it is said, will absorb the rays of the sun, can be planed, sawed, or ground like wood, grows harder by exposure to the weather, and is a building stone that will last for ages. There are four colors, green, red, and variegated, and purple, and it is proposed by parties interested in the development of the use of slate to erect a building as a specimen, to be inspected by all whom it may concern. A Pittsburg paper, which has given some attention to glass as a structural material, says that perhaps not one builder or contractor in ten, if told that the common grades of glass have a crushing strength nearly four times as great as that credited, by experienced engineers, to the strongest quality of granite, would accept the statement as true. Yet it is said to be a fact, and being so, the query as to why glass has not received more attention from architects as a structural material, naturally suggests itself.—*Chattanooga Tradesman.*

The Woods of Columbia.

We learn, says the *North-western Lumberman*, from consular reports forwarded from Carthagena, United States of Colombia, the following information relating to the timber of that republic: Besides cedar, mahogany, lignum-vitæ, nispero, limoncillo, and colorado timber, there exists an abundance of other valuable woods, such as vivaseca, lancewood, rosewood, guayba uraba, dividivi, and santa-cruz. There are also a number of wood, of the first quality for naval construction, such as corazon verde (green-heart), etc.

There is a wood called olleto, out of which piles can be made that cannot be destroyed by the teredo. Of the woods mentioned, the supply of cedar and mahogany is inexhaustible; of ebony, rosewood, colorado, and lignum-vitæ, nearly so. A cargo of timber can be procured that will average nearly 800 ft. per stick. The writer has a hewed stick of cedar which measures 42 x 48 in., 19 ft. long, and a hewed stick of mahogany which measures 24 x 34 in., 32 ft. long. He has seen a canoe 63 ft. in length by 4 ft. 4 in. in width, that had been hollowed out of the heart of a cedar tree, and one of 70 ft. in length by 10 ft. in width that was hollowed out of the heart of a campana tree. There are several trees standing in the forests near Monteria that have a circumference of 30 ft.—*Timber Trades Journal.*

The Sanitary Science of the Pentateuch.

A writer in the *Journal of Science* thinks that the knowledge of sanitary science possessed by Moses was in advance of that of to-day. He says: "So peculiar is human progress, that it has taken three thousand years to bring the civilized world to a point less advanced than that occupied by Moses. Less advanced, we say, emphatically; because, if we now admit the value of personal cleanliness, the importance of avoiding putrescent and loathsome matters, and of expelling them rapidly from our cities, and if we are theoretically aware of the disinfecting and deodorizing power of earth, we are far from embodying this, our knowledge, in the practice of actual life. As to the avoidance of blood of the flesh of foul-feeding animals, and of such as are liable to introduce entozoa into our systems, we do not recognize, even verbally, the importance of the Mosaic teachings. We eat 'blood puddings,' we feed swine with blood and with foul-smelling offal, and then we eat the animals which have been gorged on this revolting diet. And we pay the price of this uncleanliness in shortened lives and in waning vigor. We again call attention to the remarkable physiological insight displayed in the sanitary code of the ancient Israelites, and we repeat the question, Whence did it spring?"—*Sanitary Engineer.*

No State in the Union is in better condition than Tennessee. The census returns show a steady improvement in the last ten years, both in the variety and amount of the products of the soil, in manufactures, mining, and business generally, and a very gratifying gain in the population. It is safe to compute the gains to the State in new homes, new farms, stocks, bonds, new business undertakings, and in cash capital since 1865, at $500,000 000. This, over and above the the mere expenditures for the generally comfortable living of the people, ought to be very satisfactory, and should silence those who would prevent capital and immigration from coming into the State, which, after more than one hundred years of labor by an honest, hard-working, and thrifty people, they declare to be so pauperized that the poor man cannot pay for their daily bread.—*Chattanooga Tradesman.*

Intending house-builders should be most careful in attending to the bedroom department. We make no objection to the house being well provided with entertaining rooms, and those of ample dimensions; but we do most strongly object to the system, too often adopted, of obtaining these at the expense of cramped passages, stairways, and confined bedrooms. Nothing adds so much to the comfort of a man's life as good roomy bedrooms, and nothing to the convenience of a family as plenty of them. Architects, in claiming, and unfortunately getting, ample space for reception, dining, and other rooms, and giving the least dimensions to the bedrooms, seem to forget that in no room does a man spend so much of his time as in the latter. It should, therefore, be so large as to give plenty of room, and to have the bed so placed that when the window or door is open it will not be in the line of direct draft. Ask a physician, and he will tell you, that in cases of severe illness, there is nothing he dreads so much as the confined room in which his patient is placed; the air in it is always foul, and can only be made fresh at a fearful risk. Looking at the question from all sides, we are strong advocates for large bedrooms, indeed, for their comprising the best rooms in the house—for the confined closets which our architects and builders often deem it right to give us we have a profound contempt. There can be no real health enjoyed when a person lives more than half his time in a little cramped-up room.—*Builder and Wood-Worker.*

Dark Houses.

A dark house is always unhealthy, always an ill-aired house. Want of light stops growth, and promotes scrofula, rickets, etc., among the children. People lose their health in a dark house, and if they get ill, they cannot get well again in it. Dr. Edwards, of Paris, says the action of light tends to develop the different parts of the body in that just proportion which characterizes the species, and that in warm climates, the exposure of the whole surface of the body to the action of the light will be very favorable to the regular conformation of the body. Humboldt confirms this in the account of his voyage to the equinoctial regions. He says: "Both men and women (whose bodies are constantly inured to the effect of light) are very muscular, and possess fleshy and rounded forms. It is needless to add, that I have not seen among this people a single case of natural deformity."—*Builder and Wood Worker.*

There is nothing new under the sun. Luminous paint, which produces beautiful effects in the dark, is being introduced as a novelty, when in fact the Emperor of China, in the year of grace, 976, possessed a painting, the subject of which every morning left its frame to go and take a walk, and was only on view at night. The Emperor naturally thought there was something peculiar about the artist, but it turned out that he made his paints of a luminous substance extracted from the oyster. To-day, a thousand years later, oyster-shells and sulphur are astonishing our grown-up minds.—*Industrial News.*

The *American Manufacturer* says: "The industrial development of the South is advancing by leaps and bounds, and the beauty of it is the fact that the other sections of the country have no feeling of jealousy, but, on the contrary, have only words of encouragement. We are glad that this feeling exists—glad in behalf of the South, glad in behalf of the other sections, and glad in behalf of our common country, in whose greatness and progress we all take pride."—*Chattanooga Tradesman.*

Renewal and Payment of Subscriptions.

We trust that every present subscriber will at once renew his subscription, and each induce at least five others who have not, to subscribe. We mean progression and improvement in our publication work, and hope our friends will sustain us handsomely. Send $2 for 1882. Remittances by postal money-order, bank-check, or any other convenient means will be duly acknowledged. If postal stamps, send the two-cent denomination. We want a circulation of not less than

20,000 PAYING SUBSCRIBERS.

BOUND VOLUMES FOR 1881

Now ready for delivery, price, $2.50. We have on hand a few copies of 1880, and will forward either or both to any address.

The Strength of Wood.

At the late fair of the Massachusetts Charitable Mechanics' Association, held at Boston, there were exhibited interesting tests of constructive material, among these, of pine columns, which had in some instances supported remarkable pressure. One of these columns, originally twelve feet long, yielded to a pressure of 190,000 pounds; the weak spot being a large knot, which acted as a wedge, and caused the destruction of the column at less than the proper figures for a sound piece. Another column was twelve feet long, and tapering from seven and three-fourths to six and a half inches in diameter. This stick showed its weakest point at the smaller end, the crumbling of the fibers taking place in that part. A seasoned hard pine girder, eleven inches square and ten feet long, bore the astonishing load of 751,000 pounds.—*Southern Manufacturer and Builder.*

Tramps.

Fifty years ago there were no tramps, but there were plenty of apprentices. Then everybody could learn a trade; now boys are shut out by the arbitrary laws of trades' unions; manufacturers dare not employ any boys, and the beneficent, time-honored apprenticeship is entirely abolished. Boys without trades grow up without education, and become idle members of society, living upon their relatives when times are good, and when they cannot keep them longer, the youngsters are turned loose upon society perfect outlaws. If the apprentice system can be again introduced, which means the destruction or modification of trades' unions, we shall see a wholesome change. Tramps are the result of the abolishment of the apprentice system; let us encourage home manufactures and home manufactures by teaching trades to the young.—*Manufacturer and Builder.*

Growth of Portland, Oregon.

The *Oregonian* reports $1,150,075 expended in building improvements at Portland, during 1881. The larger operations are reported: one of $85,000; one of $50,000; two of $43,000; three of $40,000; two of $25,000; one of $22,000; one of $15,000; two of $12,000; four of $10,000; and so on down to small amounts. The $50,000 building was "the largest and handsomest residence erected during the year, for Hon. J. N. Dolph, containing twenty-two rooms, all finished in toa and black walnut. Mr. H. W. Cleveland of San Francisco, architect.

Street improvements are reported at a total of $283,538.37. Anticipations for 1882 are large.

☞ **Subscription price of this journal is $2.00 in advance.**

Market Reports.

LUMBER.—Owing to causes stated in another place, the demand for lumber has been light during the past month. There are large contracts to fill in the near future, that will give many of our lumber dealers all they want to do to furnish it on time and in the quantity needed.

Receipts since January 1st, 1882:

Lumber.....
Shingles.....
Laths.....

A correct price list of lumber will be found below:

PAINTS.—The PIONEER is the only brand quoted, as its excellent qualities, and the fact that it is strictly a home production, has about driven all other brands out of market.

We quote Pioneer White Lead 8½ cts. per lb.

Building Intelligence.

We are well pleased at being able to chronicle the year just passed as being the most prosperous one that our State has witnessed for six years. The country has vied with the city in erecting stately mansions. From all parts we have received gratifying intelligence of contemplated improvements. This state of feelings has been brought about principally by two causes: two successive years of bountiful crops, and the non-speculating by farmers in mining stocks. Our exchanges are filled with accounts of barns being built, granaries erected, fences being repaired, houses being newly painted and furnished, new school-houses to take the place of the old rookeries that have for so long in many places served for "meeting places to teach young ideas how to shoot." In fact, farmers are not content to "keep the old house in repair for just one more winter"; they have in many places already secured lumber and other materials, so that when a spare day comes along they can help the village carpenter to put up a good substantial farm-house.

Very few contracts have been let in this city during the past month. This is due to two causes—rainy weather and the holidays. Work has been commenced on Blythe's new building, and contracts have been signed for the excavations, iron work, and brick work for the first section, 60 x 140. The store on the corner of Geary and Dupont has been leased by a prominent firm at a large rental.

A rumor has been on the street that one of the oldest hotel buildings in the State is to be torn down to make way for a fine business block. Many an old '49er will be sorry to see it taken away. If the report should be true, it will be the means of building up a locality that was once the liveliest part of town, but for many years past has degenerated into one of the dullest.

SAN FRANCISCO.

Improvements have been commenced on the property bounded by Geary and Market, east of Dupont. Five-story and basement brick building. Owner, T. H. Blythe; architect, F. R. Lueders; contractor for brick work and excavations, J. W. Fry. Total amount of contract, including iron work, about $45,000.

Four-story brick building, with basement, on north side of Ellis Street, between Stockton and Powell. Owners, N. & E. W. Hopkins; architect, Chas. W. Geddes; brick work, W. E. Stevens; carpenter work, T. H. Day. Cost, in the neighborhood of $50,000.

Two-story and basement frame dwelling, brick foundation, on Scott Street, near Haight. Owner and builder, J. Scheerer; days' work; cost, $3,500.

Two-story building, store and dwelling, on Hayes Street, near Gough. Owner, Benjamin Daniels; architect, W. H. Bayless; contractor, J. Dutton; cost, $3,500.

Two-story frame building on south side of Valencia St., between Seventeenth and Eighteenth. Owner, H. Bergerot; architect, W. H. Bayless; contractor, —— Downey; cost, $1,700.

Repairs to building, 514 Sixth Street. Owner, Hibernia Bank; architect, P. Huerne; contractor, —— Kraeger; cost, $1,000.

Additional story, with extensions in rear, with brick basement, 561 Mission Street. Owners, Allen & White; contractor, —— Kraeger.

Additional story to building, 510 Howard Street. Owner, —— Geary; contractor, —— Riley.

Three-story frame building for furniture factory, on Bluxome Street, between Fifth and Sixth. Owner, —— Crandall.

Store fixtures for Nolan Brothers, on Market Street below Dupont. Architect, T. J. Welsh; contractor, Alex. Flood.

Three-story and basement frame building on Stockton St., between Pacific and Broadway. Owner, —— Ketterman; contractors, Chase & Buckley; cost, $4,300.

Tank building on Mission Street, between Spear and Main. Contractor, W H. Wickersham.

OAKLAND.

Two-story addition to frame building on corner of Seventh and Webster. Owner, A. Davis; Day's work; cost, $2,500.

Remodeling of house on Webster near Seventh. Cost about $500.

Oakland View Homestead, westerly side of Vernon Street near junction of Lee. Owner, Thomas Ewing; architect, Chas. F. Mau; contractor, Robt. Smilie; cost, $20,000.

Alterations to dwelling on corner of Twelfth and Jackson. Owner, Hester Hands; architect, C. F. Mau; cost about $5,000.

One-story dwelling on Kirkham Street between Eighth and Tenth. Owner, Dr. Shardlow; architect, C. F. Mau; contractors, Haskell, Smilie & Co.; cost, $2,000.

HAYWARDS.

Two-story and basement frame dwelling near depot. Owner, —— Spear; architects, Wolfe & Son; contractor, B. F. Ellis; cost about $2,200.

BODIE.

The foundry owned by Wells & Kilpatrick, which was lately burnt down, is now being rebuilt.

MERCED.

Record vaults in connection with the Court House. Architect, H. D. Mitchell; contractors Hughes & McCann; cost, $12,000.

SAN LEANDRO.

Two-story frame building for manufactory. Owner, L. B. Connor; contractor, B. F. Ellis; cost, $2,500.

FRESNO.

Two-story frame building for blacksmith shop. Owners, Atkinson & Gray.

Two-story frame building for hotel. Builder, C. M. Jones.

One-story frame building for carpenter shop. Builder, Mr. Dearneal.

SAN MIGUEL.

Catholic church; architect, T. J. Welsh; contractor, R. Doyle.

COLUSA.

Two-story frame building. Owner, S. Pence; contractor, J. C. White; cost, $2,800.

Publication Notices.

We received too late for notice in our December issue, the first number of *The Manufacturer and Inventor*, published by U. E. Wren, N. Y.: a monthly journal of twelve pages, very neatly printed and illustrated. Its general character is indicated by its title. The salutatory says, in part: "*The Manufacturer and Inventor* has for its object the ci culation of advertisements of both manufacturers and inventors, among all trades and manufacturing interests, and in all the leading cities, towns and villages in the United States." Its selection of reading matter is good.

American Sanitary Engineering, by Edward S. Philbrick, C. E., published by the *Sanitary Engineer*, N. Y., is before us. It contains 129 pages of matter and practical diagrams in reference to sanitary plumbing and sanitary matters generally. It is one of the best American books published on the subjects named, and should be read by every architect, plumber and all owners of buildings. The intelligent discussion of sanitary theories, questions and principle cannot be too largely indulged in, as they involve the health and life of mankind to a degree unequaled by any other one cause—epidemics and sweeping scourges excepted. If the great mass of communities generally, and especially those of large cities, could be made to realize the terrible consequences which daily result from defective plumbing and sewer work, there would be less contentment and quietude in the ordinary class of buildings, in which n ucre than "usual care" has been observed in matters of sanitary import.

We therefore recomend the careful and attentive perusal of the publication under notice, as supplying a large amount of practical information. Price $2.00.

The Mechanic's SLIDE RULE, *and How to Use It*, by Fred. T. Hodgson, contains a number of valuable rules for its use, measurements of timbers, etc. Price 25 cents.

LAKEY'S VILLAGE AND COUNTRY HOUSES, containing one hundred pages of designs, is one of the best of its kind published. The illustrations are neatly executed, and of practical modern design; and many of them suitable for adoption on the Pacific coast. We heartly recommend it as worthy a place in every gentleman's library who enjoys a taste for architectural matters, as well as to all architects and builders.

THE ART AND SCIENCE OF CARPENTRY MADE EASY, by William E. Bell, *revised and enlarged edition*, published in 1881, is a book of great merit, and should be read and studied by every carpenter. Too many of our working-men are content with "knowing enough for all practical purposes," overlooking the great fact, that by reading and studying instructive books much more of valuable information may be obtained, which would so far simplify the daily manipulations of material as to remove or render easy of comprehension, the difficult problems which sometimes arise, adding perplexities to the toils of the day. Price $5.00.

All books noticed in these columns can be had at publishers prices at this office.

"*Practical Lessons in Architectural Drawings*, by William B. Tuthill, A. M., Architect, published by Comstock, N. Y., is one of the most practical and useful books of its kind that we have noticed. It contains 33 full-page plates of illustrations (one in colors), and 33 wood-cuts, showing methods of construction and representation."

"*This book was suggested by the frequent call for a work of a restricted technical character, one which would give to the student who already has some knowledge of geometrical drawings, the information necessary to properly prepare his work for the mechanic.*"

It may also be read with advantage by many *practicing* architects, who judged by their delineations in construction, have as yet learned but little correctly. Copies can be had at this office, at publisher's prices. $2.50.

"*Palliser's Useful Details*," and "*Model Homes*," are also in large demand, at $3 and $1 respectively. They are both good and useful publications.

"*Saw-Gumming Tongues*," by George Preston Brown, is one of the best practical books on the subject published. Every plumber, architect, and owner should have a copy. It treates the subject handled vigogously and practically. Price $1.25.

We have received new invoices of "The Art of Saw Filing," by Holly, and the "Workshop Companion," both valuable and instructive little works, copies of each of which should be in the hands of every mechanic. Prices $1, and 35 cents, respectively.

Copies of all the works from time to time noticed in this journal may be had at this office at publisher's prices. When stamps are remitted for books or subscriptions to this journal, our friends will oblige by sending the two-cent denomination, or one-cent and three-cent if the two-cent are not obtainable. The larger denominations are inconvenient.

Palliser, Palliser & Co.'s Useful Details.—Since their introduction in our catalogue of useful publications, the sales have been large. We have a full supply on hand. Sold at publisher's price, $3.00 each set, 20x26 inches, with 40 pages of detail drawings.

A supply of all books mentioned in our catalogue constantly on hand.

Cameron's Plasterers' Manual.—While all its suggestions may not harmonize with our California practice, it is "an invaluable book of reference, containing many useful instructions which cannot be retained in the memory; such as tables, dimensions, capacity of cisterns, weights, measures, etc. Price, 75 cents.

The Art of Saw-Filing, by H. W. Holly. A really valuable treatise on the subject named. Every carpenter should secure a copy. But few mechanics know how to file saws properly, and those who perchance may be proficient can give no special rule for the result. Thousands of dollars are wasted every day by saws not being properly filed and set, and whole volumns of oaths are repeated, caused by the vexations attending irregular and ill-shaped saw teeth. Correct saw-filing is an essential to good work and the workman's comfort. Price, 75 cents.

The Carpenters' Manual, by John D. Edwards. A very useful little book, containing a large range of practical ideas in connection with mechanical studies. Carpenters and builders will find it of much more value than its cost—50 cents.

Modern Architectural Designs and Details, published by William F. Comstock, successor to Bricknell & Comstock, in 10 parts, makes—bound—a very handsome and valuable book of designs for houses, and plates of details, useful alike to architects and builders. The "parts," or numbers, separately, can be had at this office, at publisher's price, of $1 each, or the ten "parts" neatly bound for $10. All other books on architecture, steel square, and all other subjects, can be had through this office at publisher's rates. Orders from all sections of this western coast, and places bordering upon the waters of the Pacific Ocean, filled with promptness.

The Steel Square and Its Uses, by F. T. Hodgson, is an excellent little book, which should be in the hands of every carpenter. It contains numerous illustrations and treatises upon the Square, and excellent information for those who have not acquired a *full* knowledge of the use of that important mechanical instrument. Wise heads, who "know it all," do not need this or any other work or advice; but men who "live to learn" will find much in its pages to instruct them. Price, 75 cents; to be had at this office at publisher's price.

The Work-Shop Companion is full of valuable information to mechanics, housekeepers, and all classes, in the form of receipts, rules, methods, processes, etc., for almost everything in general use in workshops and households. Price, 35 cents; to be had at this office at publisher's price.

Meeting of the Architectural Association.

The regular monthly meeting of the Association was held on the 3rd inst., at which there was an improved attendance, and increased interest manifested. President Laver in the chair.

After the regular business was transacted, Mr. Harold D. Mitchell delivered an address before the Association, which will be found in another portion of this issue. It was well received, and contains suggestions of practical interest to all owners of property as well as to architects, and will repay perusal.

The president and secretary were instructed to adopt and forward to the association of British Architects, London, an expression of sympathy and condolence on the death of George Edmund Street.

It was also resolved that the Association hold a public meeting in April next, at which an address is to be delivered, and the presentation of premiums awarded for the best design for frontispiece or heading for this journal. *We hope that the architectural draughtsmen and students of the profession on this coast will receive increased encouragement by the announcement of this fact.* A committee of three, consisting of Messrs. Curlett, Sanders, and Mitchell, were appointed to select a speaker for the occasion.

Applications for membership were received, and other matters of interest receiving attention, the Association adjourned to meet the first Friday in March.

In Memoriam of George Edmund Street, R. A.

WHEREAS, The announcement of the death of George Edmund Street, of London, having been received by the Pacific Coast Association of Architects with profound sorrow and regret, it was deemed proper by the Association, that we join with our professional brethren of England and the entire civilized world, in adding tribute to the memory of him who in life enjoyed so pre-eminent a position in the profession.

The loss by death of leading men in any profession or pursuit of life naturally creates a void which, for the time being, none who remain feel competent to fill.

While the intelligent world bows in submission to the decree of Him who cannot err in the removal of loved and honored ones from the paths of life, from circles of friends and kindred dear, and the association of trusting and admiring minds, it is but right that those who are spared should unite in expressions of sorrow and words of common sympathy. Therefore be it

Resolved, That the Pacific Coast Association of Architects, meeting at the city of San Francisco, State of California, recognizes an irreparable loss to the profession generally in the death of our late professional brother, George Edmund Street.

Resolved, That this Association sincerely regrets the untimely death of him who in life became one of the best and brightest lights of the profession, and by his superior intelligence and devotion to the science of architecture added so much to its intelligent development, purity, and grandeur, and by his skill as an artist and power as a writer, won for himself the high esteem and admiration of his architectural brethren throughout civilization.

Resolved, That this Association extends its sincere sympathy and condolence to our brethren of England in the great loss sustained by the profession; and to the bereaved family and friends of him whose loss we mourn.

Resolved, That a copy hereof be forwarded to the Royal Institute of British Architects, and through it to the family of our deceased brother, George Edmund Street.

A Monument to the Honored Dead.

That one should be erected in this city to the memory of the late beloved Chief Magistrate of the United States, James A. Garfield, cannot admit of a question; and its accomplishment should be as free from error as the life of him whose name will be inscribed upon its tablets was pure and honest.

The gentlemen having the matter in hand enjoy good reputations among their fellow-men in the business and ordinary relationships of life. But in the matter of securing designs and providing for the erection of a monument, they have not thus far exhibited any special qualifications. Their first step, the invitation for designs, was an error, with a large intermixture of injustice and unfairness, as far as the conditions thereof are concerned. They have asked architects to spend time, skill, and labor in working up and designing a monument suitable to the memory of the great and good man whose memory it is to perpetuate, and offered a compensation by no means adequate for the purpose. It is expected that architects will produce something really handsome, something which in art designing requiring the same amount of artistic ability and labor would command five or ten times the sum offered as first premium. And to render the inadequacy and injustice more complete, the architect who produces the most elegant conception is to be debarred the rightful privilege of superintending the execution of his own mind's creation. This is how the matter at present stands, and the course pursued shadows forth a purpose of some character not clearly made manifest by the invitation for designs, and justifies the inquiry whether the committee have selected some one who they consider *specially* qualified to superintend the execution of the work. If so, they should have confined the preparation of the design to such party, and not seek to buy, by means of competition, at insignificant compensation, the skill and artistic conceptions of competent architects to assist those who may be unable to conceive or produce on paper a suitable design for the purpose contemplated. There is certainly an error in procedure, and the gentlemen of the committee should amend their action, and shape matters so that the successful designer shall enjoy the fair and equitable privilege of consumating in practical execution that which by his skill shall received the first award.

To those familiar with such matters, the affair as at present presented involves a question as to the unimpeachableness of future management, and the committee should endeavor to amend their action in the premiums so far had, and yield the right to the successful architect to perfect his production by details and personal superintendence.

We cannot refrain from repeating our disapproval of the too common practice of seeking to obtain the artistic and skillful labors of architects at unfair and insufficient pay, and using their productions with as little advantage or profit as possible to those whose mind work is unchecked except by the slumbers of night.

The Forests of Louisiana.

The New Orleans *Democrat* says that the most valuable and important woods suitable for lumber, in the State, are the oak, of several varieties, principally the live and white; the pine both long and short leaf: the cypress, cottonwood, gum, and black-walnut. Each of these trees has its particular use and advantage, which makes it especially adapted to one of those numerous industries in which wood forms the principal material. There are other States which have good box-timber, others again with plenty of material for house-building, for shipbuilding, or for staves; but Louisiana possesses such a variety of timber as would make it a field for every one of the sixty odd industries into which wood enters, from the simple sawmill lumber to the best veneering, polished and fancy woods. The pine is the most abundant tree in the State, and constitutes over a third of the lumber wood of Louisiana. The cypress is unexcelled for shingles. Walnut and gum are well adapted to cabinet making. The first is master of the furniture field, while the gum has a brilliant future before it, and promises to be its successor at an early day. The cottonwood has been found fully equal to the famous white pine of Michigan for boxes, and even stronger and more durable. The live-oak is admittedly the best timber for ship-building in the world. Growing in the swamps, it becomes completely impervious to water, and will resist water-rotting longer than any other wood known. The white oak has been found unexcelled for staves for the tougher barrels and casks. In shipping this timber to Europe, New Orleans does a large business. The ash and smaller oaks are unexcelled for fuel; they are firm and hard, and give a long-lasting and hot fire. Excellent charcoal is furnished by the pine. These varieties of woods are to be found in nearly every portion of the State, and cover nineteen-twentieths of the forest area of Louisiana. It is estimated that the State of Louisiana contains about 80,000,000,000 feet of good lumber, more than twice as much as Michigan; and 300,000,000 cords of wood fuel, worth, when sawed, some fifteen times the assessed value of the State, some $20,000,000.—*American Architect.*

Leaden Pipes and Cement.

Leaden pipes and cement both play such important parts in the building trade that their mutual relations offer a subject of great practical interest. In this country, if we are not mistaken, the notion is very prevalent among practical men of the trade that the two things harmonize to perfection, and that no reason exists why they should not be placed together, even in the most intimate contact. It is believed, that agreeing at first and for a season, they agree permanently or forever, that is to say, as long as they respectively exist or continue good for use.

It would appear, however, that the foregoing common notion touching leaden pipes and cement must be somewhat modified, if not surrendered, if recent communications from Germany are to be accepted as true. In the underground apartment of the railway station edifice at Brunswick, a part of the tube system connected with the water-closets ceased to answer its purpose; in words, it became disordered. On examination, it was found that a leaden pipe of 0.013 meter internal, and 0.02 meter outer diameter, so far as it lay in the mason-work and was surrounded by cement, had been destroyed, corroded by external influences. The corroded parts exhibited a reddish gray color and a granular quality.

The condition of the pipe, and generally the circumstances of the case, suggested, in view of the known nature of the cement, that the destruction of the pipe had resulted from the alkali in the cement being set free. The case seemed sufficiently interesting to justify the sending of the injured pipe to the celebrated professor of chemistry, Dr. Fr. Knapp, in order to obtain his opinion.

With characteristic readiness to impart knowledge and oblige inquirers, Dr. Knapp, after a little while, replied by letter as follows: "Cements, and especially Portland cements, possess the peculiarity that, in the act of hardening and by reason of their content of lime in excess, they give off free alkali (kali, natron, potash), which, along with the water of the cement paste, form what is usually called lye, or corroding lye. Under the influence of water and air the lead becomes coated with a thin layer, a sort of lead lime, which adheres very firmly, and (as a rule) forms a protective covering against further corrosion. Even this protective covering, however, does not resist the operation of the alkali (kali, natron), and is easily taken up by it, so that, the protecting sheet being withdrawn, the corrosion proceeds. As the piece of pipe you have sent me (with your permission I add it to my collection) clearly shows, the corrosion, in accordance with the foregoing view, has not gone on from within outwards, but from without inwards; and furthermore, in the concrete case, the strongly crystaline quality of the lead has furthered and hastened the destruction. In order to arrive at a conclusive judgment, an investigation of the case in all details, and not merely of the leaden pipe, would of course be necessary."

In answer to the question, What means should be applied to prevent the occurrence of such mischiefs? Professor Knapp replied: "If my supposition as to the cause of the destruction is correct, then I should recommend, as a preventive remedy, the repeated washing of the cement plaster, after the hardening, in order to remove the alkali which has become free. Perhaps a coating of the leaden pipe with gypsum before applying the cement might be advantageous. It is to be presumed that cements of different origins are very different or unlike in their influence upon lead."

So far concludes Professor Knapp, as reported by Herr Albert Fuldner, an engineer connected with the management of the Brunswick railway. Soon after the publication of the foregoing statement, the case became the subject of discussion in the Polytechnical Society of Berlin. On that occasion, in answer to the question, Can leaden pipes be laid in cement without danger? Herr Elster said: "It often happens that masses or pieces of lead which have lain during some years in a cellar, become partially corroded, but in such cases we must presume that the lead was not pure, but was adulterated with zinc, and that an electrical operation came into play especially on damp ground."

Some one remarked that when sulphur or gypsum is in the cement, the lead may be thus corroded.

Herr Maerz said: "When the drainage and other pipes were being laid in my father's house, the contractor refused to lay the lead in cement, for the reason that the lead would be corroded by the cement." Herr Maerz promised to make further inquiries on the subject, and report the result.

Later, apparently at a subsequent session of the Polytechnical Society, Herr Maerz resumed the subject, saying:

"I have further taken pains to find out how far it is true that leaden pipes are affected by cement, and from many practical pipe layers I learn that lead brought into contact with cement becomes hard, brittle, and easily broken, and in a short time ceases to be impervious to water, so that to lay leaden pipes in cement is a mistake. Masons whom I questioned were of the opposite opinion. They said that in cement lead holds out perfectly good, but not in lime. It was, of course, safe to take for granted *a priori* that leaden pipes would not keep good in moist lime, since alkaline substances affect lead."

In order to gain additional knowledge of an experimental kind, continued Herr Maerz, "I applied to the Machinists' Union, from some ten of whose members I obtained the answer that lead by no means keeps good in cement. A single member said that he had known a leaden pipe connected with a water-closet to last many years in good condition, though it was built in with cement. Perhaps a good deal depends upon the quality of the cement, of what sort it is, though I know nothing definite on that point. On the other hand, I was told that lead in lime keeps good, though not in cement—a flat contradiction of what I had been assured by others. In places where old metals are dealt in, it is alleged that old lead pipe offered for sale is at once examined for traces of cement, and if they are found on it the pipe is for the most part marked as worthless."

Herr Maerz finally described an experiment he was about to try with the object of testing the influence of cement on lead, and thus settling the question in controversy. Whereupon, Herr Elster remarked that in his opinion it all turned on the point of moisture. If moisture is present the lead will be destroyed by lime, etc., as it enters into the basic as well as acid combinations.

Dr. Darmstaedter closed the discussion with the remark that in the destruction of leaden pipes by cement carbonic acid probably plays a part, as it is combined with lead in the formation of carbonate of lead. That corrosion may take place the addition of moisture is necessary, and without it Herr Maerz's experiments can yield no results.—*Brick, Tile, and Metal Review.*

The Position of the Skilled Mechanic.

No matter to what extent the refinement in machine tools may be carried, it is in the end the careful and painstaking operation of the skilled mechanic that must bring the products of these tools to a perfection that will meet the requirements of modern demands. The lathe will not turn so round that, in this respect, its production cannot be improved by the handwork of the skilled machinist; nor will the milling or planing machine produce surfaces so true that he is not called upon to rectify them with the file and scraper. Now, as ever, the beautiful finish on iron and steel is the result of the individual effort of the operator, rather than of the perfection of tools.

Years ago the opinion prevailed to a considerable extent, that the services of the highly skilled mechanic would not be so much a matter of necessity in the future as in the past, but those who built on such grounds built poorly. The man will always be superior to the machine, and must always see better than he can perform.

One man may direct the efforts of fifty skilled workmen to the production of good work; but fifty men cannot get good work from one unskilled workman. Improved tools and mechanical appliances will simply assist the artisan in the production of fine work; but the greater the refinements of these tools and appliances, the greater must be his skill. Instead of relieving him of his responsibilities, which would be in every sense a misfortune, they add to them, which makes him, in every way, the better, in being able to meet them.

Altogether, the position of the skilled mechanic is in every way satisfactory, in its relation to improved machine production; and the tools and appliances of the future, however refined, can never usurp his place in the industries of the world, nor relieve him of the part he is to play in future mechanical advancement.—*Mining and Scientific Press.*

Description of the Steel Square.

Being a History and Description of the Square. Methods and rules given by which the length and bevels are obtained of all kinds of rafters, braces, collar-beams, brackets, etc. Its application to the various cuts in stair-building. The whole designed to be a complete *help* to mechanics, by which they can work in a systematic manner all the various problems in regard to the *cuts in carpentry.*

It will no doubt seem superfluous to many mechanics in this age of progress, to insert in this series of articles a description of the Board Measure, as it was on squares, made twenty years ago. During the past two months we have received several letters on this very subject, and we, in deference to their wishes, insert a description of the now ancient way to find the number of feet in a board.

According to the old way, an *approximate* measure only was found; the contents were given in feet, and the fractions were disregarded. It would not do in these days to call a board sixteen feet, when in reality it measured five inches over that amount.

The engraving shows that the figures are arranged diagonally instead of being directly under each other, as will be seen by referring to our border. The use of this measure is simlar to the one described below. This scale has been given up for want of accuracy, and is only to be found on the cheaper grade of squares.

The scale in use at present, and the one adopted by our first-class manufacturers of squares, is known as the "ESSEX BOARD MEASURE." It is always found on the back of the "body" of the square, and is used by combining it with the inch graduations on the outer edge.

Under the figure 12, of the inch graduation marks, along the outer edge of the "body" will be found the figures 8, 9, 10, 11, 12, 13, 14, 15, which represent the length of the board to be measured. The board measure in feet and inches will be found under the particular inch-mark along the outer edge of the board to be measured. Suppose the board measure is required of a board 8 feet long and 6 inches wide: Find the figure 8 in the scale, immediately under the 12-inch graduation mark, and pass the pencil along to the left, on a line with the figure 8 to the graduation mark 5, which represents the width of the board, and you stop in the scale at the figure 4, which is 4 feet, the board measure required.

If the board is the same length and 10 inches wide, look under the graduation mark 10, on a line with the figure 8 before mentioned, and you will find 6 feet 8 inches board measure. If 18 inches wide, then to the right under the graduation 18, and 12 feet is found to be the board measure.

If 13 feet long and 7 inches wide, find the figure 13 in the scale under the before-mentioned graduation mark 12, and on the same line, under the 7 inch graduation (which represents the width), will be found 7 feet 6 inches board measure.

If the board is half this length, take half of the above result; if double the length, then double the result. In this way the scale covers all length of boards.

If the board is 27 feet in length, take 13 and 14 foot lengths and add them together. The above illustrations apply to boards one inch in thickness. It is evident, therefore, that the amount of lumber contained in any piece of timber may be readily obtained by first finding the number of feet in a board 1 inch thick, and multiplying by the number of inches contained in the thickness of the timber.

Near the junction of the "BODY" and "TONGUE" on the "BACK" of the square, between the figures 2 and 4, will be found the "HUNDREDTHS" or "DIAGONAL" scale. The fine lines between the figures 2 and 4, parallel with the edge of the tongue, divide the inch into TENTHS. The diagonal lines which cross the parallel lines subdivide the tenths into hundredths, thus forming a scale by which we can readily obtain the "hundredths of an inch."

The diagonal scale is formed as follows: One inch is divided into 10 equal parts, both above and below; from the top of the first perpendicular, draw a line to the first division below; continue parallel lines, as shown in the cut of square in our border; the first division on the second line from the top becomes one-hundredths of an inch, and each of the others on the parallel lines, one-tenth.

The scale of hundredths reads downwards from the second parallel line, at the intersection of the first diagonal at the right hand corner, this being the hundredths of an inch; the space next below is two-hundredths, the next three-hundredths, and so on to the last, which is ten-hundredths, or one-tenth of an inch. Many sets of drawing instruments contain this scale, the use of which is identical with that found on the square.

TO BE CONTINUED.

In response to a question proposed to us during the last month, we would say that the Octagonal scale can be used for any size of timber. If the timber is larger in size than the numbers of divisions in the scale, double or treble the measurements as may be necessary.

The Octagon scale is also on most of the pocket rules, given on two lines, marked M and E. The divisions on the line M will be found to correspond with those on the square, and are used in the same way.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

Japanning and Japans.

When finished wood, papier-mâché composition, or materials are varnished in the usual manner and left to dry in the air, the drying is in most cases imperfect, and the coating more or less uneven. If the surface thus varnished is heated for some time to a temperature of from 250° to 300°, F., or higher, it is found that the whole of the solvent or vehicle of the gums or resins in the varnish is soon driven off, and the gummy residue becomes liquefied or semi-liquefied, in which state it adapts itself to all inequalities, and if the coating is thick enough, presents a uniform glossy surface, which it retains on cooling. This process of drying out and fusion secures a firm contact and adhesion of the gums or resins to the surface of the substance varnished, and greatly increases the density of the coating, which enables it to resist wear and retain its gloss longer.

This process of hardening and finishing varnished or lacquered work by the aid of heat constitutes the chief feature of the japanner's art.

In practice, the work to be japanned is first thoroughly cleansed and dried. If of wood, composition, or other porous material it is given while warm several coats of wood filler, or whiting mixed up with a rather thin glue size, and is, when this is hardened, rubbed down smooth with pumice stone. It is then ready for the japan grounds. Metals as a rule require no special preparation, receiving the grounds directly on the clean, dry surface.

In japanning, wood and similar substances require a much lower degree of heat and usually a longer exposure in the oven than metals, and again a higher temperature may be advantageously employed when the japan is dark than when light-colored grounds are used; so that a definite knowledge of just how much heat can be safely applied and how long an exposure is required with different substances and different grounds can only be acquired by practical experience.

The japanner's oven is usually a room or large box constructed of sheet metal, and heated by stove-drums or flues, so that the temperature—which is indicated by a thermometer or pyrometer hung up inside, or with its stem passing through the side wall midway between the top and bottom of the chamber—can be readily regulated by dampers. The ovens are also provided with a chimney to carry off the vapors derived from the drying varnish, a small door through which the work can be entered and removed, and wire shelves and hooks for its support in the chamber. The ovens must be kept perfectly free from dust, smoke, and moisture.

A good cheap priming varnish for work to be japanned consists of:

Shellac (pale)	2 ounces.
Rosin (pale)	2 "
Rectified spirit	1 pint.

Two or three coats of this is put on the work in a warm, dry room. A good black ground is prepared by grinding fine ivory black with a sufficient quantity of alcoholic shellac varnish on a stone slab, with a muller, until a perfectly smooth black varnish is obtained. If other colors are required, the clear varnish is mixed and ground with the proper quantity of suitable pigments in a similar manner: for red, vermilion or Indian red; green, chrome-green or Prussian blue and chrome-yellow; blue, Prussian blue, ultramarine, or indigo; yellow, chrome-yellow, etc. But black is the hue commonly required. The following are good common black grounds:

1.

Asphaltum	1 pound.
Balsam of capivi	1 "
Oil of turpentine	q. s.

The asphaltum is melted over a fire, and the balsam, previously heated, is mixed in with it. The mixture is then removed from fire and mixed with the turpentine.

2. Moisten good lampblack with oil of turpentine, and grind it very fine with a muller on a stone plate. Then add a sufficient quantity of ordinary copal varnish and rub well together.

3.

Asphaltum	3 ounces.
Boiled oil	4 quarts.
Burnt umber	8 ounces.
Oil of turpentine	q. s.

Melt the asphaltum, stir in the oil, previously heated, then the umber, and when cooling thin down with the oil of turpentine.

An extra fine black is prepared from:

Amber	12 ounces.
Asphaltum (purified)	2 "
Boiled oil	½ pint.
Resin	2 ounces.
Oil of turpentine	16 "

Fuse the gum and resin and asphaltum, add the hot oil, stir well together, and when cooling add the turpentine.

A white ground is prepared from copal varnish and zinc white or starch. Large japanners seldom make their own varnishes, as they can procure them more cheaply from the varnish maker.

From one to six or more coats of varnish are applied to work in japanning, each coat being hardened in the oven before the next is put on. The last coat in colored work is usually of clear varnish, without coloring matters, and is in fine work sometimes finished with rotten stone and chamois. For ordinary work the gloss developed in the oven under favorable conditions is sufficient.—*Scientific American.*

Tracing the Storms.

The matter of a Signal Service system for the Pacific coast, by which we may be enabled to fix their entrance on this coast and trace their direction, has long been talked of and desired. The prospects are now that the system will soon be inaugurated. Lieut. C. H. Kilbourne has recently returned from a trip north, where he went to select sites for the establishment of the new Service stations, which it is thought that Congress will this winter appropriate funds for. He reports, as the result of his observations, that the general path of storms upon the Pacific coast is from the west eastward, with a southeasterly trend. The storm center strikes about Victoria, and the southern outer circle of the storm usually strikes Cape Flattery, the most north-western point on our territory, first. The full force of the storms is felt in British Columbia, where the winds work great ravage. Therefore, a station upon Cape Flattery would give the first indications of approaching storms. For this reason Flattery is chosen as one of the proposed posts. Another station will be established at the mouth of the Columbia or on Tillamook rock.

Another point that the lieutenant is specially instructed to investigate is at Cape Mendocino. The benefit arising from taking observations at those points can hardly be estimated, as the whole system of calculations must be based mainly upon them. There are now but two coast stations—that in this city, and the San Diego station. It is thought that, in addition to these stations, another will be established at Cape Disappointment. In the event of an appropriation being passed for these stations this winter, an independent coast weather service will be inaugurated here, the observations of which will eventually add much to the general knowledge of the meteorology of the Pacific coast.

Defective Flues.

As usual, after a few days of very cold weather, accounts come in from all quarters of damage done by "defective flues." The worst of these occurrences during the past week seems to have been the total destruction of the Hartford High School Building, involving a loss of one hundred and twenty thousand dollars. It is true that accounts disagree as to whether the catastrophe should be attributed to a "defective flue" or an "overheated furnace," but in point of fact these expressions mean the same thing; and if they really indicate the origin of the fire, either of them simply means that through the ignorance or neglect of some one, wood-work was placed in the construction in dangerous proximity to apparatus for containing and conveying burning fuel, gas, and heated air, and on its temperature being raised to a degree somewhat higher than usual, on account of the necessary urging of the neighboring fire, it obeyed the natural law provided for it, and entered into combustion. There is nothing new or surprising about this; and the needful thickness of the walls of flues, the necessary distance of wood-work from them and from heated furnaces or pipes, and the proper means of protecting exposed surfaces, are all well known: so that the explanation of the destruction of such a structure by the theory of overheated furnaces or defective flues always, to the professional mind, casts a serious imputation on those who had the care of building it. The architect may not be, and very probably is not, at fault; indeed, in such cases, he is usually the one who pleads for safe and solid construction, to be overruled by his committee, who decline to sanction any departure from the common modes of building; but such matters should no longer be left to chance or caprice. Let school committees and school architects build for themselves what they will, they have no right, and should be forcibly prevented from trifling with the lives of the children whose safety is intrusted to their care. It is humiliating to reflect that school-houses, even the most costly ones, are considered by underwriters to be among the more hazardous of ordinary buildings, and this quite independent of the planning, which is such that the burning of one during school hours is almost always attended with serious or fatal casualties. There is in England a certain society for promoting the erection of churches, which employs its large income in assisting poor parishes to provide themselves with houses of worship. In the exercise of this charity it has acquired a very great and beneficial influence over ecclesiastical architecture, by publishing a set of rules for convenient and suitable planning, and strong and sincere construction, which must be observed by those who apply for its aid. These rules are strictly enforced by the simple means of refusing any grant whatever to a church not built in accordance with them. It would not, perhaps, be amiss to provide for imposing similar care upon the builders of school-houses, by prohibiting the expenditure of public funds on any in which such an accident as that at Hartford would be possible. If architect, contractor, and committee knew that their only chance for obtaining money to pay for such a building depended upon the certificate of disinterested experts, that under no circumstances could the children who were to occupy it be burned, suffocated, trampled to death, or even seriously frightened or injured, on account of fire, the standard of school-house construction would soon be materially raised.—*American Architect and Building News.*

The Toilers and Workers.

In reviewing the greatness of own fair land of freedom—great in itself, in its wealth and endless resources, and among the nations of the earth unequaled in its rapid attainment of the enviable position reached within a few generations—naturally invites inquiry as to the secret of this unparalleled advancement from infancy to national manhood and vigor. Century after century rolled over the inhabitants of the "parent countries," the nations of the Old World, only to find, at the end of each, the masses still groping in the mists and gloom of mastery and servitude. Liberty of thought, the exercise of mind powers among the workers, were held in restraint, and freedom of action denied, the "masters" assuming all the higher rights and privileges to themselves, and exacting of those under them uncomplaining obedience to every command and dictation.

Thus for ages the mechanical world moved not beyond the prescribed limits and grooves which customs, sometimes cruel in their severities, had defined for the classes. Yet but little murmuring was heard, because men had been trained to accept those conditions, and taught to feel that there could be no other.

But in the course of human events, as though the great power wrapped in the mantles of impenetrable mystery and infinity had tired at the sight of this unequal condition of things, the day star of release was made to appear, with the discovery of the great American continent, and the pilgrim landing was but the escort to the results which have followed. The beginning, true, was small, and the number of those who first began the work of rolling away the ponderous stones which had so long held the working classes of earth in the sepulchral-like slumbers of submissive servitudes and enforced ignorance, was small; but in due time, the dawn of deliverance appeared, and the gates of human progress were opened upon the American continent, and wide-spreading fields by degrees revealed, in which the oppressed of every land might find a refuge and a home. Slowly at first, but steadily, the work went on, and the taper-light of advancement, lighted by the pilgrim fathers, the pioneers of freedom, expanded into more brilliant rays, until it reflected across the waters of great oceans, and was seen by thousands whose fathers and grandsires had lived through centuries and died under systems of oppression, without realizing that the invisible order of things had appointed to all men the right to think and act for themselves.

That which has followed and resulted from this small beginning is beyond the power of pen or tongue to write or tell; nor is it our purpose to dwell upon the historical incidents and wonderful developments which have ensued. The point aimed at is to invite the reflection of the laboring and mechanical masses to a consideration of the state of facts which have been strewn all along our nation's pathway from then till now. Have they used the innumerable advantages and privileges opened up to them as wisely as they might have done? Have they controlled the currents of events so as to gather unto themselves the fruits of their toil, in the richness and fullness made possible by grand opportunities? It cannot be denied that the brains and strong arms of the working classes have been the power that has moved and kept in motion the great machinery of progression, and opened up the resources of this mighty continent; and that from their ranks have sprung nearly all the great minds and intellects which have mastered and encompassed all sciences, and placed our earth almost in converse with the numberless planets and systems which, through inconceivably numerous cycles of time, have continued to swing out in incomprehensible space. It is only sometimes that the children of fortune, and those born in palaces and abodes of luxury, have added mechanical or scientific gems to the world's great cabinet of precious things. These come more from those inured to earnest, persistent mental and physical toil, who live by doing and to do. But is it not also a fact, that many who have plowed and planted more have reaped and gathered but little? How many millions of men of genius and sterling abilities and worth have spent their lives, consumed their talent, and shortened their stay on earth, through excessive application and devotion in perfecting devices and discoveries originating with them, or completing those begun and in part completed by others? Yet it can scarcely be claimed that compensating results have always followed their efforts. These few reflections suggest the question, whether the toilers of the world have not failed to enjoy that richness and largeness of reward so faithfully earned and deserved, through excessive application to the special objects of their lives, without due appreciation of the compensations which should ever be the heritage of those who bring forth new things in thought or in material form, or who, by their labor, assist in beautifying this footstool of God, in skillfully manipulating the great resources of our earth.

The Chinese Problem

Cannot be too earnestly agitated by those having the best interests of the United States and its thousands of hard-working inhabitants at heart. It is not a question made prominent by unprincipled demagoges, for the purpose of rallying the masses in movements through which the leaders may and expect to secure large personal or political advantages; but one of universal importance, bearing heavily upon all interests, and threatening serious injury to every class of labor, manufacture, and to capital itself. While California has been and always will be the greater sufferer from Chinese immigration, because her "Golden Gate" is the more convenient ingress, still, it is only a matter of time, when, if restriction is not provided and enforced against their coming, other cities and States of this country will smart under the like scourge, with that which has been so severely felt within the cities and States of this Western coast.

The people of the Eastern States have been slow in accepting the great facts of the issue, and have inclined to question and disregard the voice of their Western brothers, who, groaning under the load imposed upon them through the presence of scores of thousands of the Mongolian race, have cried in strong and earnest tones for relief. This cry has been and is sincere, and comes from every section and from all classes: for all, *all* have been made to realize the thousand-fold greater evils arising from the competitions and aggressive movements of the Chinese on this coast, than the few advantages that may have been gained through cheap Chinese labor.

There is nothing more necessary and essential to the welfare and prosperity of the Pacific States than the right kind of immigration; and if the Chinese element was not *absolutely injurious*, the people of the "Flowery Kingdom" would be welcome to our midst, as compensating for the absence of people of our own race and affiliations. But the experiences of the past thirty odd years in California have fully demonstrated the fact, that Chinese competition, in either labor, manufacture, or any of the common pursuits which give employment to the masses, is of the most objectionable and damaging character; while, as it has before been stated in this journal, even capital itself on this coast has felt the effects of Chinese encroachments. The few who have formed Chinese alliances in business relationships have doubtless profited thereby; while Chinamen themselves have been the greater gainers in learning our customs, mechanical arts, methods of business, etc., which in time will be used by them with master hands. For they are as selfish and unscrupulous as they are cunning and treacherous, and will utilize every advantage gained to their own benefit.

All this is fully demonstrated in San Francisco. During the entire time of its existence as a city, with all the many millions of dollars gained by the Chinese people, not one of them has ever invested a single dollar in the purchase and improvement of real estate for *residence* purpose outside of what is known as the Chinese quarters, which in themselves, as a whole, are a disgrace to the city in which they are permitted to exist. These quarters have always been overcrowded and filthy in the extreme; still the additional thousands added to their former number, by arrivala within the current year, have been stowed away within limits wherein all laws of health and all sanitary regulations have been held in constant disregard.

This city and State have suffered enormously more from the presence of the Chinese than it is possible to estimate. But for them, there would have been a much larger population, sand-lotism would never have been heard of, Dennis Kearney would have remained unknown, and the terrible pressure that rested upon the business interests of this city during '78-79 would never have occurred. But they furnished pretext for the hue and cry of demagogues—"The Chinese must go"; and all business interests were, for a period, prostrated and paralyzed, and the laboring classes borne down to almost starvation. Under these circumstances and conditions, it is but reasonable and right that the people of this coast should continue to agitate the Chinese question, and ask and demand a solution of the problem which, in its practical operation, has been so disastrous to all classes, and which will most assuredly work terrible injury to the entire country, if not checked by congressional legislation of the most stringent and positive character.

An Iron-clad Contract.

A ship-building firm on the Thames has undertaken to build an iron-clad of novel construction for the Brazilian Government, under a contract which includes a novel series of penalty clauses. The ship is designed to steam fifteen knots per hour, but if she fails by a quarter of a knot a penalty of £2,000 is to be paid; and so for every quarter of a knot in an ascending scale, until for a shortcoming of a knot of speed per hour a penalty of £16,000 will have to be paid; while the loss of a knot and a quarter will involve a fine of £32,000, and if a speed of less than thirteen and a half knots per hour can only be attained, a sum equal to one-sixth of the total price of the vessel will be forfeited. If, again, the vessel when launched draws an inch of water more than the draught named in the contract, £1,000 is to be deducted from the price to be paid for the ship, and so on, again in ascending scale, until a penalty of £25,000 is reached for six inches excess of draught.—*American Architect.*

There are at present in the Old World and the New World more than 100,000 railway locomotives. Their total force is equal to 30,000,000 horse power, and all the other steam engines on the globe are estimated at 46,000,000 horse power. The technical "horse power," however, is really equal to three average horses, and each horse to about seven men; the aggregate power, therefore, of all the engines being vastly more than the effective force of all the human workers living. Four-fifths of the steam engines now at work have been made within a quarter of a century or so.—*American Inventor.*

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

[While this column is open to all, farmers as well as mechanics, engineers as well as architects, we would call particular attention to one and all to have their questions and the information desired to be in accord, as far as possible, with the interests of this journal and for the carrying out of those principles for which the only monthly of its kind this side of the continent, was established. We will endeavor to answer all questions in a fair and impartial manner, and if it becomes necessary, will furnish cuts for the illustrations of any problem, provided we regard the solution thereof as beneficial to the majority of our readers. We would urge upon our patrons the necessity of being pointed in their questions, concise in the language used; let the writing be distinct, and one side of the paper only to be used; give full name and address, and particularly mention if their proper name shall be used.

We want it distinctly understood that the responsibility of signed articles rests with the authors.

Correspondents will please direct all communications to the business manager of this journal—240 Montgomery street, rooms 12 and 13.]

TO CUT A RAKE CROWN MOLDING SO AS TO MITER WITH A PLUMB EAVE.

"Make the *plumb* cuts down the sides of the box as shown at A A, and cut the miter across the top as usual; but remember, a *square miter* will not do.

"TO GET THE SIDE BEVEL.—Measure the diagonal of the rise of one foot run of the common rafter, measuring across the square from 6 to 12 (for a quarter pitch), which will be nearly 13½ inches. Now lay down the square to 12 and 13½, the same as laying out a miter, and use the *long* bevel. The *down* bevel will be the same as that of a common rafter.

"This rule applies to *any* pitch, by taking the pitch line of one foot run, and taking this with 12 to obtain the miter, using the *long* bevel. The same bevel will also do for mitering rake, facia, and frieze, or *any* raking member to a level one standing plumb."

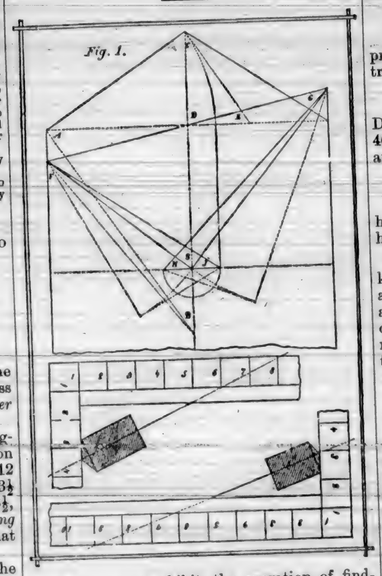
The above is taken from a work entitled, "The Carpenters' Pocket Companion." We will forward a copy of the same to any address upon receipt of ONE DOLLAR.

BUSINESS MANAGER OF ARCHITECT: Can an architect residing in Victoria, B. C., become a member of the Association of Architects in San Francisco. L., New Westminster.

ANS.—The object of the Association is to include every architect on the Pacific slope, British Columbia as well as California.

BUSINESS MANAGER OF ARCHITECT: Will you please explain, in your Everybody's Column, the difference between fire-clay and ordinary clay.
RAVENSWOOD.

"The main chemical difference between fire-clay and ordinary clay is that the former contains no lime or iron. These substances are not objectional for ordinary building brick, but they render the material unfit to resist strong heat, as they cause the brick to vitrify first and to fuse finally, when high temperatures are attained. In physical appearance the fire-clay or *slate-clay* is gray or grayish yellow; massive, dull, or glimmering from admixture of particles of mica. Its fracture is slaty, approaching sometimes to earthy. It is soft, sectile, and easily broken. It adheres to the tongue, and breaks down in water. It occurs along with pit coal. For making fire-brick it is ground, and reduced into a paste with water. Common clay or *loam* is soft to the touch, and forms with water a somewhat tenacious paste, but is in general more compact, more friable, than the plastic clays, which are more readily diffusible in water. Although soft to the touch, the common clay wants unctuosity, properly so called. It is usually of a bluish or blackish color. Those of its strata which effervesce with acids partake of the nature of marl. It is employed in the manufacture of bricks, tiles, and coarse pottery ware."



The above cut exhibits the operation of finding a section of the hip rafters for an obtuse and acute-angled building, with the steel square.

Figure 1.—The plan and elevation of an obtuse and acute-angled building; also, the elevation of the common rafters. Join F S and G S, the plan of the hip rafters. Draw A B and C E at right angles to A C, the common rafter; join B F. To find the lengths of the hip rafters: from the point A as center, with A C as radius, describe an arc; from the point C, and extend to the line H J, join F J and G H, the lengths required.

To find the backing, or section of the hip rafters for the obtuse angle when in position, place the square on the line of the rafter, with the distance A B on the blade, and the distance C D on the tongue; then the tongue gives the angle required. To find the section of the hip rafter for the acute angle, take the distance F B on the blade, and C E on the tongue; then the tongue gives the angle to form the section required.

To find the section or backing of a hip rafter for right-angled buildings, place the square on the line of the rafter, with the length on the blade and the rise on the tongue; then the tongue gives the angle required.

The angle to cut the sides of the common and jack rafters are the same for both. The angle to cut the face of the jack rafters are at H and J. The lengths of the jack rafters are found by dividing the common rafter into as many parts as there are jack rafters required. The horizontal and vertical lines for cutting the hips are shown by the dotted lines drawn from G H and F J.

To find the length of the common rafter A C, place the blade of the square on the line A D; square up twelve inches from the point A to the line A C; then the length from the point of intersection to the point A, multiplied by the number of feet in the line A D, gives the length required; also the horizontal and vertical cuts for the ends of the rafters. The same operation applies to finding the lengths and cuts of braces.

The above is taken from a new work entitled, "Steel Square Problems." A copy of the Steel Square and Its Uses, and Steel Square Problems sent to any address upon receipt of $1.25.

BUSINESS MANAGER OF ARCHITECT: What proportion does the rough lumber cut from a tree bear to the clear lumber.
INQUIRER, Santa Rosa.

ANS.—It varies in different localities. In Del Notre and Humboldt counties, it is about 46 per cent.; in Mendocino, about 56 per cent.; and in Sonoma, 76 per cent.

A "young mechanic" wants us to inform him how to tell whether butts are for left or right hand doors.

Lay the butts on the bench or table with the knuckle-joint towards the right hand. If they are open at the top they are right hand, if open at the bottom they are left hand. A door that opens away from you to the right, is called a right-hand door. If it opens away from you to the left, it is called a left-hand door.

Cistern Water.

We have received frequent inquiries regarding the use of cistern water for drinking purposes. No general reply can be given that will hold good in all cases. Under certain conditions cistern water is found to be very pure, and excepting for the flat, insipid taste, is preferable to most well water. First, then, in considering whether cistern water is fit to drink, we ask whether the roof on which it falls is of tin, wood, lead, or slate. Are any injurious metals employed for gutters or leaders? Is the house surrounded by overhanging trees, from which the leaves collect in the gutters and are washed into the cistern? Do pigeons or fowls frequent the roof, and soil it? For these and other reasons it is not advisable to permit the first washings of the roof to enter the cistern. The cistern itself should be well made, carefully cemented, and thoroughly cleansed at least every two years. It should have free access of pure air, not the air of a cellar, and the pump-pipe should not reach too near the bottom so as to stir up the sediment. It is well to throw into the cistern from time to time a peck of freshly burnt charcoal. One corner of the cistern may be walled off with porous brick, so as to strain the water that passes through, and the pump-pipe may be placed within this little cell. Lead pipe must under no circumstances be placed in a cistern, because lead is attacked by soft water, and here both exterior and interior are exposed to its action. Iron is less objectionable, but it is preferable to have it coated within and without with asphalt varnish, or, better yet, with india-rubber. When cistern water acquires a bad smell, stop using it, except for cooking or making tea. If it is during the dry season, when you cannot afford to pump it out and cleanse it, try the addition of charcoal and forcing air through it. Cisterns ought not to be in close proximity to drains and cess-pools, although they are much safer than wells similarly situated. — *Boston Journal of Chemistry.*

REMOVAL OF STRONG ODORS.—It is said that ground mustard is an excellent agent for cleansing the hands after handling odorous substances, such as cod-liver oil, musk, valerianic acid, and its salts. Scale pans and vessels of various kinds may also be readily freed from odor by the same substance.

Architecture in America: Its History up to the Present Time.

Architecture, venerable with ages of honor, yet holds a prominent position in the progress of the world, and puts forth ever and anon new claims to attention. While America remained a colony, there was neither time nor opportunity for the practice of the fine arts. A new country, far removed from all the comforts belonging to an advanced civilization, its early settlers found themselves fully occupied in supplying their immediate wants and protecting themselves from the savage enmity which they had by their exorbitant greediness of gain awakened. When the Revolution was over, however, and the country's independence a foregone conclusion, Congress, in spite of heavy debt, poor credit, and an army of growlers, proceeded to lay out a national capital, and erect buildings. To the nations of Europe they looked for models in architecture, as well as in law and government; and therefore the classic styles, as they are called, then very popular, were at once adopted. The first public building of any note erected in America was the Capitol, at Washington. It is of the Renaissance, and consists of two stories, rising from a lofty basement. The ground plan is a central pavilion, with north and south wings. The principal façade is on the east side, where a portico of Corinthian columns thirty feet in hight fronts the pavilion, while pilasters of the same order are continued along the wings. The right middle columns project so as to admit of another inner row, and these sixteen columns support a noble pediment, adorned with a bas-relief, the subject being allegorical. The approach to this imposing portico is by a flight of broad marble steps. The central portion of the edifice is, for the most part, occupied by a circular apartment, measuring about one hundred feet in diameter and hight, and known as the Rotunda. It is ornamented with paintings and bas-reliefs illustrative of our national history. The paintings are separated from one another by gilded pilasters, which rise to the dome, forming the roof. The pediment of the north wing is especially noticeable for its sculptures, representing America surrounded by a group of figures emblematic of her history and sources of wealth; as, the Pioneer, the Miner, the Indian, Education, etc. The original dome of the Rotunda, which sprung directly from the roofing, has been replaced by one of dimensions corresponding to the present size of the building. Upon a solid octagonal base rests the lofty drum, pierced by two rows of narrow arched windows, separated by pilasters. From the top of the entablature rises a second narrower base, its cornice separated by inverted consoles, and from this spring the ribs of the dome. They are thirty-two in number, and support a lantern. The whole is crowned by a bronze statue of America. This dome, two hundred and forty-one feet in hight, is imposing from its size, and forms the principal feature in every view of the city, and bears a considerable resemblance to the dome of St. Paul's, London—almost equaling the latter in architectural beauty and effect.

Besides the numerous buildings of the Renaissance style erected in Washington, others, not only by the Government, but by banking corporations, commercial houses, etc., have been erected in various parts of the country.

There is much that we can study over in our styles of to-day which may give us some idea of how we actually stand in reference to true taste; for that is founded on unchangeable laws: and that it is so, we should feel thankful, because nothing save a breach of those laws can ever permit us to wander far from the truth; and should we so stray, a consideration of those laws will surely lead us back again to the point from whence we deviated.

The laws we allude to are founded on common sense, and therefore cannot lead us into error by clinging to them.

That the Renaissance is open to a vast deal of objection, there is no doubt, for it will not stand the test of close investigation tried by those laws; so that, although we have gained much by the adaptability of iron to ornamental architecture, we have, through its means, run riot in the field of taste; and in endeavoring to outdo the past, have very likely subjected the present to a charge of absurdity.

In fact, we have suffered our art to become a mere vehicle of whim; a thing of fashion, to be enjoyed for a season, like a lady's bonnet, and then be set aside for some newer fangle, which may become popular, not on account of its intrinsic merit, but by reason of mere novelty. For it is unfortunately the fact that our most sensible architects are compelled to follow in the track of capricious Fashion, or be left lingering and neglected by the wayside. While deploring this state of affairs, we must follow the old saying, "For those who live to please, must please to live."

The truth is—and I shrink not to declare it—that our brethren on this continent do not assert their native independence, nor exercise their inventive taste, which would give them character at home and abroad.

Is there any reason why American architects should not be something more than mere copyists of European models? I think they would undoubtedly be more respected by the age they live in, as well as by ages yet to come, if their works carried more the stamp of originality; in fact, more truly American, unreflected from the other side of the water.

Why, I ask, should we citizens of the wealthiest republic under the sun, both in finance and inventive genius, be compelled to follow in the footsteps of England and the continent of Europe? Why should Charles Eastlake be the dictator and we his diciples in this our latest revival in architecture, if some of the examples which we see occasionally perpetrated in San Francisco by a very few—thank goodness—of our young conceits in this "very latest." I say it is a great misfortune to the public at large, that these ingenious gentlemen cannot all be skewered with antique pins upon one of their "so-called" Eastlake elevations, and sent spinning down the illimitable reaches of eternal bosh. This class of charlatans, who have not the capacity to learn, and who build houses so flimsy the wonder is they don't fall down like a pile of ginger-bread, who start out as architects of some new school or other, and think they are the masters. It would be a charity if some one would curb the vaulting ambition of these pretenders with a hod and shovel, or some other implement of labor.

The rapid strides which our country has taken during the last thirty years lead us to give more attention to the architectural beauty of our edifices. One of these is the use of better materials: brick, stone, and iron, are now principally employed in our cities in such buildings as are intended to be permanent. The use of iron as a building material is confined, for the most part, to the last few years, except in the form of bands and rods to strengthen weak walls, its lightness and cheapness recommending it particularly in roofing. It is also molded into pilasters, columns, etc., for commercial houses and public buildings, but it is far inferior to stone, which it replaces; then again it warps when exposed to fire, and bends under great pressure, so that an iron building cannot begin to compare with the noble stone front.

At the same time, there are some *radical* defects, the most serious of these is the sacrifice of *security* to *cheapness* in the building of walls; a fault, I am happy to say, not so often chargeable upon the architect or builder, as upon the corporation or private individual who authorizes the execution of such work. Then again we are in too much haste, "a fault characteristic of us as a nation"; the consequence is, we resort to shams, and top out these eight-inch walls with entablatures and brackets of painted and sanded redwood, where the red will be cropping out all too soon.

In the erection of dwelling houses we have made much advance within the last twenty years, and no one will doubt the prevalence of an American style, especially the palatial mansions of our railway magnates, mining men, etc., which have been built regardless of expense, and which, though sometimes over-ornamented, seem almost perfect, both in architecture and arrangement.

The time must come sooner or later (and why not now?), when an original *American style* must be born of the national genius; then may the brain of our profession find ample scope for the fullest development of the æsthetic; and in a region so boundless that the sun's course across it marks a semi-circle, surely there is plentiful room for fancy.

We allow all possible credit to the architects of England and France, as well as the rest of Europe, for what they have done and are now doing. But their position in reference to architecture is very different from ours in many respects. Their taste must more or less be governed by the institutions they live under, and the demand upon them to keep alive in their works the history of past ages. The American architect has no such nightmare squatting on his breast. To him the past is as nothing compared to the mighty future. His thoughts are unchained by the commands of rulers; and his *patron* is the *public*, whose favor he must win, but whose extensive liberal opinion is more worthy of his best efforts than the despotic patronage of any emperor or king on the face of the earth.

In our national style we would be governed altogether by the fitness of design. Its fitness for the purpose for which it is to be erected. Its fitness for the locality where it is to stand. Its fitness in the material chosen, not alone as regards strength and durability, but with respect to color also. The fitness of ornamentation is a feature of our national style which should be especially attended to. *Let us have no leaves or flowers that belong not to our soil, no animals that never had an existence, such as griffins, dragons, and the like.* None of these: let everything be American in feeling and effect. Such is my idea of what a national style ought to be.

Does the American architect feel nervous as to his ability to originate such a style, and with the vast amount of information that he has in nobly edited books and accurate engravings, such as no other profession can boast of, to aid him in his glorious task? There is one good and substantial reason for our present conglomerate of architecture. Our nation is made up of many different nationalities, whose architects coming to this country bring with them the ideas of design common in their respective lands; and not alone that, but they keep up those early teachings by importing their country's architectural books and engravings.

English and American architects have taken the publications with which London can so liberally supply them. Let us patronize home industry, and the public will take a growing interest in this departure, and will expect to hear from our professional friends on subjects more akin to ourselves as a people; for no foreigners, as a body, hold the

institutions they have left in such regard as to desire their being transplanted in the architecture of this country. They simply accept this importation of old-time thoughts, for the reason that they find no pure architectural features native to this country of their adoption.

The next important thing, perhaps, in reference to our architecture is to let scientific and constructive skill proceed in their onward course unshackled by considerations of decoration or artistic beauty. Beauty is utility in blossom; and science and art are ever coeval.

The architect must throw the traces around the neck of circumstances, architecture being, like ourselves, very much the creature of circumstances. Art dwells not in any particular class of buildings, or in any particular style, but in the soul of the true artist; and its mission is not to exhibit an old style, but to imbue the necessary construction of the day with life, vigor, and sentiment. No age has been richer than our own in means and appliances, or presented scope for greater originality, and everything points to progress in our architecture—progress in many respects eclipsing anything that has gone before. We cannot again build Egyptian pyramids, Roman amphitheaters, or Greek temples, and we need not regret this; for placing architecture in a higher sphere, bringing it into loftier associations, we may and can build works of which the Roman masters of by-gone ages would have been proud, and at the same time we must not narrow up or pinch our ideas. Adoption of any particular historic style, as the manner of Queen Anne's reign, shows a narrowness of mind and mistaken idea of the true nature of fine art.

We want a style broader than anything that the architecture of Queen Anne's reign suggests, and such is the one in question—a truly American conception, which may include all styles and all periods of art, and be not a little influenced by the ecclesiastical style of the Gothic, which was so highly prized by three of England's leading architects—Barry, Scott, and the late lamented G. R. Street. While other men were studying Virtruvius, Chambers, etc., Barry (who designed the grandest Gothic building in the world, the Palace of Westminster, in London) and his colleagues were studying the inexhaustible beauties of the Gothic style, and like true artists, got hold of an idea, and worked it out; then began the battle of the styles in England. Gothic won the day, and on the heads of our late professionals rests all the glory.

Then, again, all excess is disorder. Dr. Johnson's definition of superstition is, "Religion without reason"; and the *exact proportion*, the "golden mean" in the use of ornament in architecture, as of *wine* in *gastronomy*, will forever be the *true test* of a mature intelligence and a well-balanced judgment; the frivolous and the slip-shod will never understand it.

Living, as we are, in an age of the world when knowledge is strewn broadcast over every country, and inspired with a spirit of emulation spurring us on to excel even the best works of our noble predecessors, surely we may indulge the hope that, after the present fever of gaudy excess and delirium in ornament has spent itself, True Art will be elevated to an honorable distinction above all shams and counterfeits; for notwithstanding our theories of "original sin" or of human depravity, Truth still lives, still rules the world, whether expressed in architecture, religion, or ethics—and the devoted art student, ever walking modestly, tractably, and manfully with *nature* (the loving mother of us all), shall meet his reward in a greater faith, a brighter hope, and a truer love at every progressive step towards the ineffable light of THE OMNISCIENT.

HAROLD D. MITCHELL.

Expansion of Cement and Concrete.

Opinions of authorities differ much as to the behavior of cement in setting. An examination of extensive concrete walls, such as those of the new Victoria docks, discloses a number of vertical cracks, which seem to indicate that a contraction of the mass has taken place. From the experiments made by Messrs. Dyckerhoff, it would appear that expansion and not contraction had taken place. In Mr. Henry Faija's little book, "Portland Cement for Users," which we lately noticed, two tables giving the results of experiments by Messrs. Dyckerhoff on a prism of cement of ten centimeters in length and five centimeters square, lying in water, are introduced. These tests show the amount of expansion in twelve varieties of cement from one week to twelve months old. Mixed with three parts of sand, the expansion is much diminished, and for architectural works, the results need not cause any serious apprehensions. Mr. Faija's remarks point to a possible contraction during the action of setting, which, however, is afterward replaced by a slight expansion.

This expansion or contraction is not so great that architects or engineers may feel any distrust of the value of cement concrete. It is, in fact, so slight that in practice, as Mr. Faija says, it may be disregarded, and we think it useful to quote the latter gentleman's observation on the experiments: "Ignoring, therefore, Messrs. Dyckerhoff's experiments (although they may have a theoretical value), in practice, when laying any large space, such as a courtyard or a length of footway with a concrete paving, it is advisable to lay it in sections, separating each by thin wooden battens. These battens may be removed in a few days, or when the concrete is thoroughly set and hard, and their space filled up with a similar concrete to that already laid; by this means there will be no danger of the appearance of the work being spoiled by the cracking of the concrete." For the walls of buildings this advice becomes of less importance, if the concrete is filled up in frames or panels, as we have more than once hinted; besides which, the occurrence at intervals of doors and windows, etc., would relieve any large surface.

When finished surfaces have to be made, Mr. Faija deprecates the practice of putting a differently proportioned concrete as a finishing coat. It is nearly sure to crack or peel off. It is preferable to make the concrete of a finer kind, and work the face up with a trowel or float. Thus treated, the surface may be made to have the appearance of rough-cast, or a smoother finish if desired. The crushing strength of concrete seems to have been repeatedly made the subject of experiment; yet architects and engineers, in applying the ordinary weights given in tables, seem to think that the same results ought to be reached in building everywhere, whereas those tests have only reference to a small cube of an inch each way. A one-inch cube of cement will bear a great deal more than a small pillar of it twice or three times the hight and of the same base.—*Building News.*

Wind Pressures.

The wind pressures experienced in India are remarkable. On October 5th, 1864, on the Eastern Bengal railway, two trains were upset during a violent storm. One of these was a train of eight passenger vehicles, and was upset near Echapore. The other was a train of twelve passenger vehicles, and was upset near Arrunghatta. In both cases all the passenger vehicles were blown over on their sides. Besides these carriages, four wagons were blown from a siding at Buggoolalo, and capsized about half a mile north of that station on the same day, from collisions caused by wagons which were started from sidings from the force of the wind. On September 21st, 1878, a long train of wagons, traveling at about eight miles an hour, on the Eastern Bengal railway, was brought to a standstill by a heavy storm, and was then forced back about a mile, with full steam and brake against it; eighteen wagons were then detached, but even with half the train it was found difficult to continue the journey. On November 20th, 1880, at Negapatano, on the South Indian railway, an empty covered goods wagon was upset by the wind while standing at rest in a siding. Numerous instances have occurred on the Indian railways of trains being stopped, or nearly so, by the force of the wind.

The wind pressures above alluded to are certainly very remarkable for continuous pressures; but in the exceptional cases of tornadoes, such as those which passed over portions of Kansas and other States in that vicinity during the two last seasons, the pressures were far in excess of anything related of India. If the accounts are reliable, large animals, such as horses, were lifted completely from the ground, and carried long distances in the air; human beings were lifted in the same way, and dashed to death. Houses were utterly destroyed to their foundations, and their timbers and boards scattered far and wide over the adjacent fields. Electricity doubtless has much to do with the violence of such tornadoes.—*Mining and Scientific Press.*

Glass Water Pipes.

The suggestion is made that glass would be a good material for water pipes. Glass is satisfactorily applied to several important uses where great strength and durability are required of it. It is used quite generally for paving and flooring, and as a material for railway ties possesses all the advantages of wood, and lasts 75 per cent. longer. The glass manufacturers of Pittsburg, Pa., claim that the common grades of glass turned out from their factories have nearly four times more crushing strength than the strongest quality of granite, and they say that the glass can be made into blocks suitable for the construction of buildings, and capable of being readily cemented together. It is a wonderful material, and will undoubtedly be found available in many ways, to which at present it might be thought very much unsuited. Glass used in water pipes would possess several important advantages over iron or terra cotta. Glass tubes are completely impervious to water, and are scarcely at all affected by corrosion or chemical action, to which iron is very vulnerable, and terra cotta somewhat susceptible. Glass can be made more cheaply than cast-iron. Certainly enough can be said in favor of glass water pipes to make it an object on the part of builders and plumbers to give them a fair trial.—*American Plumber.*

To make quickly-drying polish or varnish to be applied to small turned articles while in the lathe, with a hard and glossy surface, dissolve ten ounces of shellac in one gallon of wine spirit by gently heating over a water bath, and stirring. Let it stand for several days in a covered vessel, then draw off the clear portion from any sediment, for use. For ebonizing articles of this kind, put the wood for about half an hour into a hot solution of one ounce of logwood extract in a quart of water, and then transfer to a warm solution of one pound of copperas in a gallon of soft water, and let it remain in this bath for several hours. Give the pieces a second dip in the logwood and iron liquors, then rinse and dry.—*Mining and Scientific Press.*

Unprofessional Practices.

The readers of this journal will bear testimony to the fact, that we have pursued a course in its conduct calculated to elevate and ennoble the practices of the architectural profession in this city, and to discountenance all jealousies, inharmonies, and unfair procedures; and to cultivate and stimulate those kindly and fraternal relationships which should control and characterize the acts of men assuming the responsible position of architects.

Such being our purposes, reference to professional irregularities becomes exceedingly unpleasant, and it is with regrets that the allusions herein contained are made and justified by well-sustained facts.

The point in issue is the dishonorable effort put forth by some architects to secure engagements. It is *notoriously* the case with *one*, and there are several of the same class, who obtain the greater part of their work through personal and persistent solicitation, and influences other than professional merit in themselves. We *know* of cases in which, after arrangements have been completed between owners and architects, such parties have sought to intervene and disrupt completed arrangements, and by a system of *falsifying* and *misrepresentation*, both as to their own capabilities and integrity, and the qualifications of those against whose just business rights and interests such *mean*, and not too much to add, dishonorable and *dishonest*, procedures have been instituted, to rob others out of secured business engagements. The facts in one recent case will suffice in illustration to show the corruption and baseness existing in some natures. A gentleman having purchased a lot, engaged an architect to prepare plans and specifications. When the preliminary plans were about completed, the owner was called upon by the *notorious* party, who was informed of the fact that an architect had been engaged. Instead of accepting this as conclusive in the matter, this same individual began his *usual* unscrupulous method of sending *influences* to change the owner's determination, and break up the engagement already secured by a brother architect. It was not a contest to win in honorable competition, but an effort to supplant and *cheat* a professional brother out of that which to him possessed a moneyed value; for it must be admitted that when an architect obtains a professional engagement with an owner, it at once becomes a matter of actual cash value, and its loss by the intrigue or connivance of others amounts to nothing less in effect than direct robbery. This state of things is mainly the result of the unregulated surroundings of the profession during past years. The absence of society influences and established rights, rules, and principles of action, have produced in the profession all the irregularities which in the nature of the case must follow when personal interests and caprice alone shape and control in matters which should be regulated by the wise counsel and good judgment of many.

While language too strong cannot be used in denunciation of the parties and practices referred to, a relief is found in the fact that the greater number of architects in San Francisco are above reproach, as far as the disreputable and unprofessional wrong complained of is concerned; and the purification of the profession of all that tends to demoralize and corrupt its practices should receive attention. Architects who resort to questionable practices may gain personal advantages in certain cases; but every departure from strictly correct and honorable procedures must work a common injury. Pettifogging is a term used to designate a class of creatures who operate under professional assumptions, without personal merit as to qualification or integrity, and applies as well in the architectural as the legal fraternities. Baseness of any kind is condemnable, and nothing can be more vile than one party in any connection seeking to obtain all, without any consideration for the rights of others.

We challenge the accusation, that we have, in our professional career in San Francisco, in any one case, departed from the strict lines and rules of honorable and unimpeachable fairness toward brother professionals, or have ever sought to *defraud* others by *forcing* our services, when we have had the slightest information that other architects have been consulted. We therefore stand upon high ground while penning condemnation upon those who, forgetful of and indifferent to every honorable and fair inspiration or rule of action, are guilty of conduct of the disgraceful character outlined in this article. We are prepared with facts to establish much more than is contained in this article, and shall use them when occasion requires.

Test of St. Louis Water-proofing for Bricks.

The following tests of St. Louis water-proofing for bricks were recently made by Mr. F. E. Kidder, for the committee on the building materials exhibited at the Mechanic Fair recently held in Boston. The tests were made on St. Louis hydraulic-pressed brick, treated on all sides by the St. Louis Water-Proofing Company of St. Louis, in the physical laboratory of the Massachusetts Institute of Technology; very sensitive balances being used for weighing the bricks before and after immersion.

The following is taken from Mr. Kidder's report to the committee:

In order to ascertain what amount of water the bricks would absorb in their natural condition, two bricks of the same kind as those which were treated with the water-proofing were immersed in water, and at the end of one hour one brick had absorbed 9 7-10 per cent. of its weight of water, and the other 10 per cent. This was all that the bricks would absorb, as the weight of the bricks did not increase after several hours' immersion. To ascertain the effect of freezing on the saturated bricks, one of them was exposed, for a few hours, to a temperature somewhat below the freezing point of water, and the freezing of the water in the bricks burst a piece some three or four square inches in area, and about one-half an inch thick at its thickest part, out of one face of the brick.

To test the protecting qualities of the water-proofing, three of the same kind of bricks, treated on all sides with water-proofing, were immersed in water at a temperature of about 65° Fahrenheit for 70 hours, when no increase could be detected in the weight of the bricks due to immersion.

One of the bricks was afterwards immersed in water which was for a short time at a temperature of 78° Fahrenheit, and at the end of 43 hours it had absorbed 6-10 of one per cent. of its weight of water. After 120 hours further immersion in water at 65° Fahrenheit, it had absorbed 1 7-10 per cent. of its weight of water. This brick had several small cracks in it, through which this small amount of water probably entered the brick.

Two other bricks of the same kind, treated on all sides, were immersed in water at 65° Fahrenheit for 1½ hours without absorbing any water.

In 45 hours' immersion one brick absorbed 8-10 of one per cent. of its weight of water, while the other brick absorbed no water at all.

During sixteen days' immersion the brick which before had absorbed a small amount of water took up 1 3-10 per cent. of its weight of water, while the other brick took up only 7-10 of one per cent. of its weight of water. Both of these bricks had a large number of small cracks, and it was probably in these cracks that the small amount of water taken up by the bricks was contained.

The results of these tests may be summed up as follows:

Bricks *not* treated with water-proofing were entirely saturated after one hours' immersion, when they contained about 1-10 of their weight of water.

Three bricks treated on all sides with the water-proofing solution absorbed *no* water during 70 hours' immersion in water at the ordinary temperature.

Two bricks during sixteen days' immersion absorbed 1-144 and 1-73 of their weight of water respectively. The protecting power of the water-proofing is destroyed by immersing bricks treated with it in water at a higher temperature than 100° Fahrenheit, and probably even at a temperature of 85°. But bricks in ordinary situations would never be subjected to the presence of water at such high temperatures. The bricks tested were treated with water-proofing about two months before the tests were made.—*American Architect.*

Ventilation.

With respect to ventilation, it is the thing that the natural man abhors. In reference to it, I feel inclined to paraphrase that which has been said about charity, namely, that it is an emotion of the mind in which A never sees B in want, without desiring to relieve him, not with the goods of A, but with the goods of C. Similarly, it may be said that when A feels the atmosphere of a room stuffy, he desires it to be changed, not at the risk of himself, A, catching cold, but at the risk of B, or any person other than A. If a proof of this were wanted, let me refer you to any assembly where there is some big man whose orders are taken—a judge on the bench, or a chairman of a meeting. What is the direction to the attendant when the judge or chairman feels there is a need of ventilation? "I feel the air of this court or room very close; open two of those windows down there;" not "open two of the windows near me." The big man, with the natural fear of ventilation, lets somebody else bear the burden, while he himself gets the benefit. It is very rarely, indeed, that the man "down there" has either the readiness or the courage to protest. The only instance that occurs to me of the kind is that of Sydney Smith, when, as a curate, sitting at a dinner largely attended by the higher orders of the clergy, he said to the waiter, who was about to open a window close by, "Don't give me my death of cold; open one behind a bishop."—*Sir F. J. Bramwell, to the Society of Arts.*

Electrical Ball Finding.

Professor Bell has submitted to the Paris Academy another electric method (in addition to that of the induction balance) for detecting a projectile in the human body. It consists in inserting a fine needle near where the ball is supposed to be. This needle being connected by wire with one terminal of the telephone, while a metallic plate laid on the skin is connected with the other terminal, when the point of the needle reaches the ball a current arises (the ball and the metallic plate naturally forming a couple), and a sound is heard in the telephone. The needle may be inserted in several places with little pain, and the pain may be prevented by means of ether spray. The method has been tested on a piece of beef containing a ball. Contact of the needle with bone gave no sound, but there was a distinct sound whenever the ball was reached. The arrangement may be modified by introducing a vibrator into the circuit; a musical sound is then heard when the needle meets the ball. The circuit may also comprise a weak battery. In this case there is a sound from the moment the needle enters the skin; but at contact with the ball the sound is greatly intensified.

institutions they have left in such regard as to desire their being transplanted in the architecture of this country. They simply accept this importation of old-time thoughts, for the reason that they find no pure architectural features native to this country of their adoption.

The next important thing, perhaps, in reference to our architecture is to let scientific and constructive skill proceed in their onward course unshackled by considerations of decoration or artistic beauty. Beauty is utility in blossom; and science and art are ever coeval.

The architect must throw the traces around the neck of circumstances, architecture being, like ourselves, very much the creature of circumstances. Art dwells not in any particular class of buildings, or in any particular style, but in the soul of the true artist; and its mission is not to exhibit an old style, but to imbue the necessary construction of the day with life, vigor, and sentiment. No age has been richer than our own in means and appliances, or presented scope for greater originality, and everything points to progress in our architecture—progress in many respects eclipsing anything that has gone before. We cannot again build Egyptian pyramids, Roman amphitheaters, or Greek temples, and we need not regret this; for placing architecture in a higher sphere, bringing it into loftier associations, we may and can build works of which the Roman masters of by-gone ages would have been proud, and at the same time we must not narrow up or pinch our ideas. Adoption of any particular historic style, as the manner of Queen Anne's reign, shows a narrowness of mind and mistaken idea of the true nature of fine art.

We want a style broader than anything that the architecture of Queen Anne's reign suggests, and such is the one in question—a truly American conception, which may include all styles and all periods of art, and be not a little influenced by the ecclesiastical style of the Gothic, which was so highly prized by three of England's leading architects—Barry, Scott, and the late lamented G. R. Street. While other men were studying Virtruvius, Chambers, etc., Barry (who designed the grandest Gothic building in the world, the Palace of Westminster, in London) and his colleagues were studying the inexhaustible beauties of the Gothic style, and like true artists, got hold of an idea, and worked it out; then began the battle of the styles in England. Gothic won the day, and on the heads of our late professionals rests all the glory.

Then, again, all excess is disorder. Dr. Johnson's definition of superstition is, "Religion without reason"; and the *exact proportion*, the "golden mean" in the use of ornament in architecture, as of *wine* in *gastronomy*, will forever be the *true test* of a mature intelligence and a well balanced judgment; the frivolous and the slip-shod will never understand it.

Living, as we are, in an age of the world when knowledge is strewn broadcast over every country, and inspired with a spirit of emulation spurring us on to excel even the best works of our noble predecessors, surely we may indulge the hope that, after the present fever of gaudy excess and delirium in ornament has spent itself, True Art will be elevated to an honorable distinction above all shams and counterfeits; for notwithstanding our theories of "original sin" or of human depravity, Truth still lives, still rules the world, whether expressed in architecture, religion, or ethics—and the devoted art student, ever walking modestly, tractably, and manfully with *nature* (the loving mother of us all), shall meet his reward in a greater faith, a brighter hope, and a truer love at every progressive step towards the ineffable light of THE OMNISCIENT.

HAROLD D. MITCHELL.

Expansion of Cement and Concrete.

Opinions of authorities differ much as to the behavior of cement in setting. An examination of extensive concrete walls, such as those of the new Victoria docks, discloses a number of vertical cracks, which seem to indicate that a contraction of the mass has taken place. From the experiments made by Messrs. Dyckerhoff, it would appear that expansion and not contraction had taken place. In Mr. Henry Faija's little book, "Portland Cement for Users," which we lately noticed, two tables giving the results of experiments by Messrs. Dyckerhoff on a prism of cement of ten centimeters in length and five centimeters square, lying in water, are introduced. These tests show the amount of expansion in twelve varieties of cement from one week to twelve months old. Mixed with three parts of sand, the expansion is much diminished, and for architectural works, the results need not cause any serious apprehensions. Mr. Faija's remarks point to a possible contraction during the action of setting, which, however, is afterward replaced by a slight expansion.

This expansion or contraction is not so great that architects or engineers may feel any distrust of the value of cement concrete. It is, in fact, so slight that in practice, as Mr. Faija says, it may be disregarded, and we think it useful to quote the latter gentleman's observation on the experiments: "Ignoring, therefore, Messrs. Dyckerhoff's experiments (although they may have a theoretical value), in practice, when laying any large space, such as a courtyard or a length of footway with a concrete paving, it is advisable to lay it in sections, separating each by thin wooden battens. These battens may be removed in a few days, or when the concrete is thoroughly set and hard, and their space filled up with a similar concrete to that already laid; by this means there will be no danger of the appearance of the work being spoiled by the cracking of the concrete." For the walls of buildings this advice becomes of less importance, if the concrete is filled up in frames or panels, as we have more than once hinted; besides which, the occurrence at intervals of doors and windows, etc., would relieve any large surface.

When finished surfaces have to be made, Mr. Faija deprecates the practice of putting a differently proportioned concrete as a finishing coat. It is nearly sure to crack or peel off. It is preferable to make the concrete of a finer kind, and work the face up with a trowel or float. Thus treated, the surface may be made to have the appearance of rough-cast, or a smoother finish if desired. The crushing strength of concrete seems to have been repeatedly made the subject of experiment; yet architects and engineers, in applying the ordinary weights given in tables, seem to think that the same results ought to be reached in building everywhere, whereas those tests have only reference to a small cube of an inch each way. A one-inch cube of cement will bear a great deal more than a small pillar of it twice or three times the hight and of the same base.—*Building News.*

Wind Pressures.

The wind pressures experienced in India are remarkable. On October 5th, 1864, on the Eastern Bengal railway, two trains were upset during a violent storm. One of these was a train of eight passenger vehicles, and was upset near Echapore. The other was a train of twelve passenger vehicles, and was upset near Arrunghatta. In both cases all the passenger vehicles were blown over on their sides. Besides these carriages, four wagons were blown from a siding at Buggoolalo, and capsized about half a mile north of that station on the same day, from collisions caused by wagons which were started from sidings from the force of the wind. On September 21st, 1878, a long train of wagons, traveling at about eight miles an hour, on the Eastern Bengal railway, was brought to a standstill by a heavy storm, and was then forced back about a mile, with full steam and brake against it; eighteen wagons were then detached, but even with half the train it was found difficult to continue the journey. On November 20th, 1880, at Negapatano, on the South Indian railway, an empty covered goods wagon was upset by the wind while standing at rest in a siding. Numerous instances have occurred on the Indian railways of trains being stopped, or nearly so, by the force of the wind.

The wind pressures above alluded to are certainly very remarkable for continuous pressures; but in the exceptional cases of tornadoes, such as those which passed over portions of Kansas and other States in that vicinity during the two last seasons, the pressures were far in excess of anything related of India. If the accounts are reliable, large animals, such as horses, were lifted completely from the ground, and carried long distances in the air; human beings were lifted in the same way, and dashed to death. Houses were utterly destroyed to their foundations, and their timbers and boards scattered far and wide over the adjacent fields. Electricity doubtless has much to do with the violence of such torna does.—*Mining and Scientific Press.*

Glass Water Pipes.

The suggestion is made that glass would be a good material for water pipes. Glass is satisfactorily applied to several important uses where great strength and durability are required of it. It is used quite generally for paving and flooring, and as a material for railway ties possesses all the advantages of wood, and lasts 75 per cent. longer. The glass manufacturers of Pittsburg, Pa., claim that the common grades of glass turned out from their factories have nearly four times more crushing strength than the strongest quality of granite, and they say that the glass can be made into blocks suitable for the construction of buildings, and capable of being readily cemented together. It is a wonderful material, and will undoubtedly be found available in many ways, to which at present it might be thought very much unsuited. Glass used in water pipes would possess several important advantages over iron or terra cotta. Glass tubes are completely impervious to water, and are scarcely at all affected by corrosion or chemical action, to which iron is very vulnerable, and terra cotta somewhat susceptibie. Glass can be made more cheaply than cast-iron. Certainly enough can be said in favor of glass water pipes to make it an object on the part of builders and plumbers to give them a fair trial.—*American Plumber.*

To make quickly-drying polish or varnish to be applied to small turned articles while in the lathe, with a hard and glossy surface, dissolve ten ounces of shellac in one gallon of wine spirit by gently heating over a water bath, and stirring. Let it stand for several days in a covered vessel, then draw off the clear portion from any sediment, for use. For ebonizing articles of this kind, put the wood for about half an hour into a hot solution of one ounce of logwood extract in a quart of water, and then transfer to a warm solution of one pound of copperas in a gallon of soft water, and let it remain in this bath for several hours. Give the pieces a second dip in the logwood and iron liquors, then rinse and dry.—*Mining and Scientific Press.*

Unprofessional Practices.

The readers of this journal will bear testimony to the fact, that we have pursued a course in its conduct calculated to elevate and ennoble the practices of the architectural profession in this city, and to discountenance all jealousies, inharmonies, and unfair procedures; and to cultivate and stimulate those kindly and fraternal relationships which should control and characterize the acts of men assuming the responsible position of architects.

Such being our purposes, reference to professional irregularities becomes exceedingly unpleasant, and it is with regrets that the allusions herein contained are made and justified by well-sustained facts.

The point in issue is the dishonorable effort put forth by some architects to secure engagements. It is *notoriously* the case with *one*, and there are several of the same class, who obtain the greater part of their work through personal and persistent solicitation, and influences other than professional merit in themselves. We *know* of cases in which, after arrangements have been completed between owners and architects, such parties have sought to intervene and disrupt completed arrangements, and by a system of *falsifying* and *misrepresentation*, both as to their own capabilities and integrity, and the qualifications of those against whose just business rights and interests such *mean*, and not too much to add, dishonorable and *dishonest*, procedures have been instituted, to rob others out of secured business engagements. The facts in one recent case will suffice in illustration to show the corruption and baseness existing in some natures. A gentleman having purchased a lot, engaged an architect to prepare plans and specifications. When the preliminary plans were about completed, the owner was called upon by the *notorious* party, who was informed of the fact that an architect had been engaged. Instead of accepting this as conclusive in the matter, this same individual began his *usual* unscrupulous method of sending *influences* to change the owner's determination, and break up the engagement already secured by a brother architect. It was not a contest to win in honorable competition, but an effort to supplant and *cheat* a professional brother out of that which to him possessed a moneyed value; for it must be admitted that when an architect obtains a professional engagement with an owner, it at once becomes a matter of actual cash value, and its loss by the intrigue or connivance of others amounts to nothing less in effect than direct robbery. This state of things is mainly the result of the unregulated surroundings of the profession during past years. The absence of society influences and established rights, rules, and principles of action, have produced in the profession all the irregularities which in the nature of the case must follow when personal interests and caprice alone shape and control in matters which should be regulated by the wise counsel and good judgment of many.

While language too strong cannot be used in denunciation of the parties and practices referred to, a relief is found in the fact that the greater number of architects in San Francisco are above reproach, as far as the disreputable and unprofessional wrong complained of is concerned; and the purification of the profession of all that tends to demoralize and corrupt its practices should receive attention. Architects who resort to questionable practices may gain personal advantages in certain cases; but every departure from strictly correct and honorable procedures must work a common injury. Pettifogging is a term used to designate a class of creatures who operate under professional assumptions, without personal merit as to qualification or integrity, and applies as well in the architectural as the legal fraternities. Baseness of any kind is condemnable, and nothing can be more vile than one party in any connection seeking to obtain all, without any consideration for the rights of others.

We challenge the accusation, that we have, in our professional career in San Francisco, in any one case, departed from the strict lines and rules of honorable and unimpeachable fairness toward brother professionals, or have ever sought to *defraud* others by *forcing* our services, when we have had the slightest information that other architects have been consulted. We therefore stand upon high ground while penning condemnation upon those who, forgetful of and indifferent to every honorable and fair inspiration or rule of action, are guilty of conduct of the disgraceful character outlined in this article. We are prepared with facts to establish much more than is contained in this article, and shall use them when occasion requires.

Test of St. Louis Water-proofing for Bricks.

The following tests of St. Louis water-proofing for bricks were recently made by Mr. F. E. Kidder, for the committee on the building materials exhibited at the Mechanic Fair recently held in Boston. The tests were made on St. Louis hydraulic-pressed brick, treated on all sides by the St. Louis Water-Proofing Company of St. Louis, in the physical laboratory of the Massachusetts Institute of Technology; very sensitive balances being used for weighing the bricks before and after immersion.

The following is taken from Mr. Kidder's report to the committee:

In order to ascertain what amount of water the bricks would absorb in their natural condition, two bricks of the same kind as those which were treated with the water-proofing were immersed in water, and at the end of one hour one brick had absorbed 9 7-10 per cent. of its weight of water, and the other 10 per cent. This was all that the bricks would absorb, as the weight of the bricks did not increase after several hours' immersion. To ascertain the effect of freezing on the saturated bricks, one of them was exposed, for a few hours, to a temperature somewhat below the freezing point of water, and the freezing of the water in the bricks burst a piece some three or four square inches in area, and about one-half an inch thick at its thickest part, out of one face of the brick.

To test the protecting qualities of the water-proofing, three of the same kind of bricks, treated on all sides with water-proofing, were immersed in water at a temperature of about 65° Fahrenheit for 70 hours, when no increase could be detected in the weight of the bricks due to immersion.

One of the bricks was afterwards immersed in water which was for a short time at a temperature of 78° Fahrenheit, and at the end of 43 hours it had absorbed 6-10 of one per cent. of its weight of water. After 120 hours further immersion in water at 65° Fahrenheit, it had absorbed 1 7-10 per cent. of its weight of water. This brick had several small cracks in it, through which this small amount of water probably entered the brick.

Two other bricks of the same kind, treated on all sides, were immersed in water at 65° Fahrenheit for 1½ hours without absorbing any water.

In 45 hours' immersion one brick absorbed 8-10 of one per cent. of its weight of water, while the other brick absorbed no water at all.

During sixteen days' immersion the brick which before had absorbed a small amount of water took up 1 3-10 per cent. of its weight of water, while the other brick took up only 7-10 of one per cent. of its weight of water. Both of these bricks had a large number of small cracks, and it was probably in these cracks that the small amount of water taken up by the bricks was contained.

The results of these tests may be summed up as follows:

Bricks *not* treated with water-proofing were entirely saturated after one hours' immersion, when they contained about 1-10 of their weight of water.

Three bricks treated on all sides with the water-proofing solution absorbed *no* water during 70 hours' immersion in water at the ordinary temperature.

Two bricks during sixteen days' immersion absorbed 1-144 and 1-73 of their weight of water respectively. The protecting power of the water-proofing is destroyed by immersing bricks treated with it in water at a higher temperature than 100° Fahrenheit, and probably even at a temperature of 85°. But bricks in ordinary situations would never be subjected to the presence of water at such high temperatures. The bricks tested were treated with water-proofing about two months before the tests were made.—*American Architect.*

Ventilation.

With respect to ventilation, it is the thing that the natural man abhors. In reference to it, I feel inclined to paraphrase that which has been said about charity, namely, that it is an emotion of the mind in which A never sees B in want, without desiring to relieve him, not with the goods of A, but with the goods of C. Similarly, it may be said that when A feels the atmosphere of a room stuffy, he desires it to be changed, not at the risk of himself, A, catching cold, but at the risk of B, or any person other than A. If a proof of this were wanted, let me refer you to any assembly where there is some big man whose orders are taken—a judge on the bench, or a chairman of a meeting. What is the direction to the attendant when the judge or chairman feels there is a need of ventilation? "I feel the air of this court or room very close; open two of those windows down there;" not "open two of the windows near me." The big man, with the natural fear of ventilation, lets somebody else bear the burden, while he himself gets the benefit. It is very rarely, indeed, that the man "down there" has either the readiness or the courage to protest. The only instance that occurs to me of the kind is that of Sydney Smith, when, as a curate, sitting at a dinner largely attended by the higher orders of the clergy, he said to the waiter, who was about to open a window close by, "Don't give me my death of cold; open one behind a bishop."—*Sir F. J. Bramwell, to the Society of Arts.*

Electrical Ball Finding.

Professor Bell has submitted to the Paris Academy another electric method (in addition to that of the induction balance) for detecting a projectile in the human body. It consists in inserting a fine needle near where the ball is supposed to be. This needle being connected by wire with one terminal of the telephone, while a metallic plate laid on the skin is connected with the other terminal, when the point of the needle reaches the ball a current arises (the ball and the metallic plate naturally forming a couple), and a sound is heard in the telephone. The needle may be inserted in several places with little pain, and the pain may be prevented by means of ether spray. The method has been tested on a piece of beef containing a ball. Contact of the needle with bone gave no sound, but there was a distinct sound whenever the ball was reached. The arrangement may be modified by introducing a vibrator into the circuit; a musical sound is then heard when the needle meets the ball. The circuit may also comprise a weak battery. In this case there is a sound from the moment the needle enters the skin; but at contact with the ball the sound is greatly intensified.

Market Reports.

LUMBER.—Fair demand, steady supply, prices firm, is all we can chronicle.

Receipts since January 1st, 1882:

Lumber	19,428,450
Shingles	5,185,500
Laths	3,308,500

A correct price list of lumber will be found below:

Pine.

Common Rough, up to 40 feet, per M feet	$22 50

PAINTS.—The PIONEER is the only brand quoted, as its excellent qualities, and the fact that it is strictly a home production, has about driven all other brands out of market.

We quote Pioneer White Lead 8½ cts. per lb.

Unpropitious Weather.

The severe north winds which have so largely prevailed during the past six weeks, without sufficiency of rain to counteract their bad effects, have materially checked the progress of contemplated improvements in San Francisco. The quantity of rain that has thus far fallen is far below the average for the same extent of usual wet season, and unless copious showers descend in time to compensate for the lack thus far experienced, the winter of 1881–82, may be numbered among the dry seasons in California.

That such should be the case is greatly to be regretted. As full recovery from the depression of former years, and a return to wonted prosperity only fairly set in with 1881, we are scarcely prepared for a set back by reason of an unpropitious season, or otherwise. Still it is not too late for an abundance, and we hope and trust that the later rains may fully atone for the lightness of the early showers. The prevalence of the north winds is quite as much to be regretted as the limited supply of rain.

Steel Square Problems. A new work explaining the uses of the Steel Square. Sent postpaid to any address upon receipt of 50 cents.

Building Intelligence.

Very few contracts have been let this month, or in fact this year, so far. 1882 has started in very poorly compared with 1881, in the number of buildings being erected. The dry weather has, no doubt, caused some to wait awhile before erecting dwellings. The high prices of lumber, hardware, and other materials have caused the non-erection of several dwellings that have been *figured on*, estimates being too high to meet owners' views. Such contracts as have been signed during the month will be found below.

SAN FRANCISCO.

Excavations and brick foundation for two-story and basement dwelling on southeast corner of Post and Gough. Owner, Jacob Levi, Sen.; architects, Wolfe & Son; contractors, Byron Bros.; cost, $1,100.

Three-story frame building with brick basement on northwest corner of Powell and Post. Owner, J. W. Williams; architect, H. D. Mitchell; contractor, R. P. Hurlbut; cost, $10,000.

Two-story tenement frame building on the north side of Ellis, between Laguna and Octavia. Owner, Jerome English; architects, Curlett & Eisen; contractor, David Perry; cost, $4,000.

Two-story frame dwelling on south side of California street, between Buchanan and Laguna. Owner, C. P. Blethen; architects, McDougall & Son; contractor, T. H. Day; cost, $7,000.

Two-story frame dwelling on southwest corner of Fair Oaks and Twenty-first streets. Owner, S. W. Dick; architects, McDougall & Son; contractor, J. Furness; cost, $5,000.

Repairs and alterations to building on northeast corner of Sansome and Pacific. Owner, R. H. McDonald; architect, J. Marquis; contractor, B. F. Ellis; cost, about $10,000.

Two-story frame dwelling on corner of Twenty-fourth and Sanchez. Owner, J. M. Cohen; architect J. Gosling; contractor, J. Martin; cost, $3,000.

Additions to brick building on Pine street, between Kearand Montgomery. Owner, ——Hennessey; Days' work.

One-story frame dwelling on Kisling street, between Eleventh and Twelfth. Owner, J. E. Tosney; architect, J. T. Kidd; contractor, T. Sullivan; cost, $1,287.

Two-story and basement frame dwelling on Jackson street, between Octavia and Laguna. Architects, Wright and Sanders; contractor, J. Robinson; cost, about $12,000.

Two-story frame building—stores and dwelling—on Post street, west of Polk. Owner, Levi Straus; architect, J. P. Gaynor; contractors, Bowles and Darrow; Cost, about $6,000.

Contract for carpenter work on Blythe's building has been let to Thos. H. Day. About $35,000.

Two-story frame building on corner of Fifteenth and Mission. Owner, ——McNicol; contractor, ——Laherty; cost, $3,500.

Two-story frame building on Scott street, between California and Sacramento. Owner, W. E. Norwood; architect, J. Marquis; contractor, W. M. Fletcher; cost, $5,500.

Northwest corner of Lake and Second Avenue. Two-story frame dwelling with basement. Owner, Mrs. A. De Watson.

Frame building on corner of California and Fourth Avenues. Owner, Jos. Colando.

South San Francisco. On Fifth Avenue. A two-story frame building to be used for a manufactory. Owner, J. Bouile. Days' work; cost, about $2,000.

FRESNO.

One-story and basement frame dwelling at Washington Colony. Owner, Geo. Rowell; contractor, C. F. Carlson; cost, $2,000.

One story and basement frame dwelling. Owner, Chas. Burke; contractor, C. F. Carlson; cost, $1,400.

One story frame dwelling. Owner, Judge Holmes; architect, ——Atkinson; contractor, ——Madera; cost, $2,500.

One-story frame dwelling. Owner, Dr. Graves; cost, $1,700.

One-story frame cottage. Owner, E. Hall; architect, W. J. Beers; Days' work; cost, 3,000.

Two-story and basement brick building on Mariposa street for stores and offices. Owners, M. J. Donahue and others; architect, W. H. Donahue; contractor, ——Clifford; cost, $15,000.

NEWARK.

Tank Building, tanks, etc. Owner, E. A. Davis; architect, H. Geilfuss; carpenter work, J. Lenzen; brick work, ——McCarthy; cost, about $5,000.

BERKELEY.

Frame dwelling for C. L. Storch. Builder, C. Beardslee, cost, $1,700.

RIVERSIDE.

Two-story frame dwelling on Brockton Avenue. Owner, Capt. B. B. Handy; cost, $2,500.

Two-story brick building on Main street. Owner, S. J. Branch; cost, $2,500.

WOODLAND.

One-story residence on North Court street. Owner and builder, Al. Sears.

CHICO.

Building for a flour mill. Owners, Hubbard and Shand; contractor, L. Hansen.

Publication Notices.

The Mechanic's SLIDE RULE, *and How to Use It*, by Fred. T. Hodgson, contains a number of valuable rules for its use, measurements of timbers, etc. Price 25 cents.

LAKEY'S VILLAGE AND COUNTRY HOUSES, containing one hundred pages of designs, is one of the best of its kind published. The illustrations are neatly executed, and of practical modern design; and many of them suitable for adoption on the Pacific coast. We heartly recommend it as worthy a place in every gentleman's library who enjoys a taste for architectural matters, as well as to all architects and builders.

THE ART AND SCIENCE OF CARPENTRY MADE EASY, by William E. Bell, *revised and enlarged edition*, published in 1881, is a book of great merit, and should be read and studied by every carpenter. Too many of our working-men are content with "knowing enough for all practical purposes," overlooking the great fact, that by reading and studying instructive books much more of valuable information may be obtained, which would so far simplify the daily manipulations of material as to remove or render easy of comprehension, the difficult problems which sometimes arise, adding perplexities to the toils of the day. Price $5.00.

All books noticed in these columns can be had at publishers prices at this office.

"*Practical Lessons in Architectural Drawings*, by William B. Tuthill, A. M., Architect, published by Comstock, N. Y., is one of the most practical and useful books of its kind that we have noticed. It contains 33 full-page plates of illustrations (one in colors), and 33 wood-cuts, showing methods of construction and representation."

"*This book was suggested by the frequent call for a work of a restricted technical character, one which would give to the student who already has some knowledge of geometrical drawings, the information necessary to properly prepare his work for the mechanic.*"

It may also be read with advantage by many *practicing* architects, who judged by their delineations in construction, have as yet learned but little correctly. Copies can be had at this office, at publisher's prices. $2.50.

"*Sewer-Gas and its Dangers*," by George Preston Brown, is one of the best practical books on the subject published. Every plumber, architect, and owner should have a copy. It treates the subject handled vigogously and practically. Price $1.25.

We have received new invoices of "The Art of Saw Filing," by Holly, and the "Workshop Companion," both valuable and instructive little works, copies of each of which should be in the hands of every mechanic. Prices $1, and 35 cents, respectively.

Copies of all the works from time to time noticed in this journal may be had at this office at publisher's prices. When stamps are remitted for books or subscriptions to this journal, our friends will oblige by sending the two-cent denomination, or one-cent and three-cent if the two-cent are not obtainable. The larger denominations are inconvenient.

Palliser, Palliser & Co.'s Useful Details.—Since their introduction in our catalogue of useful publications, the sales have been large. We have a full supply on hand. Sold at publisher's price, $3.00 each set, 20x26 inches, with 40 pages of detail drawings.

A supply of all books mentioned in our catalogue constantly on hand.

Cameron's Plasterers' Manual.—While all its suggestions may not harmonize with our California practice, it is "an invaluable book of reference, containing many useful instructions which cannot be retained in the memory; such as tables, dimensions, capacity of cisterns, weights, measures, etc. Price, 75 cents.

The Art of Saw-Filing, by H. W. Holly. A really valuable treatise on the subject named. Every carpenter should secure a copy. But few mechanics know how to file saws properly, and those who perchance may be proficient can give no special rule for the result. Thousands of dollars are wasted every day by saws not being properly filed and set, and whole volumns of oaths are repeated, caused by the vexations attending irregular and ill-shaped saw teeth. Correct saw-filing is an essential to good work and the workman's comfort. Price, 75 cents.

The Carpenters' Manual, by John D. Edwards. A very useful little book, containing a large range of practical ideas in connection with mechanical studies. Carpenters and builders will find it of much more value than its cost—50 cents.

Modern Architectural Designs and Details, published by William F. Comstock, successor to Bricknell & Comstock, in 10 parts, makes—bound—a very handsome and valuable book of designs for houses, and plates of details, useful alike to architects and builders. The "parts," or numbers, separately, can be had at this office, at publisher's price, of $1 each, or the ten "parts" neatly bound for $10. All other books on architecture, steel square, and all other subjects, can be had through this office at publisher's rates. Orders from all sections of this western coast, and places bordering upon the waters of the Pacific Ocean, filled with promptness.

The Steel Square and Its Uses, by F. T. Hodgson, is an excellent little book, which should be in the hands of every carpenter. It contains numerous illustrations and treatises upon the Square, and excellent information for those who have not acquired a *full* knowledge of the use of that important mechanical instrument. Wise heads, who "know it all," do not need this or any other work or advice; but men who "live to learn," will find much in its pages to instruct them. Price, 75 cents; to be had at this office at publisher's price.

The Work-Shop Companion is full of valuable information to mechanics, housekeepers, and all classes, in the form of receipts, rules, methods, processes, etc., for almost everything in general use in workshops and households. Price, 35 cents; to be had at this office at publisher's price.

The California Architect and Building News.

VOLUME III.
NUMBER 3. SAN FRANCISCO, MARCH, 1882. $2.00 per Annum, in Advance. Single Copies, 20 Cents.

The California Architect
— AND —
BUILDING NEWS.

Published on the 15th of each month by the

SAN FRANCISCO ARCHITECTURAL PUBLISHING CO.

JAMES E. WOLFE, Editor and Manager,
240 MONTGOMERY STREET.

GEO. H. WOLFE, Business Manager,
Room 11, 240 Montgomery St.

Sent to any part of the U. S., postage paid, at $2.00 per annum, with extra cost of postage when sent to Foreign Countries.

Entered at the Post Office at San Francisco, Cal., as second-class matter.

ADVERTISING RATES.

Outside of front cover, per square, each insertion	$ 2 50
Outside of back cover, per square, each insertion	2 00
Page following Building Intelligence, per square, each insertion	1 50
Page preceding reading matter, per square, each insertion	1 25
Other inside pages, per square, each insertion	1 00
Full page, inside, one insertion	32 50
Each subsequent insertion	25 00

Reasonable reductions for advertisements continued six or twelve months.

BACK NUMBERS OF THIS JOURNAL.

Since we commenced our series of articles on the HISTORY, DESCRIPTION, AND USES OF THE STEEL SQUARE, we have had an unusual demand for back numbers containing said articles. We regret to say that we have on hand but a

☞ FEW NUMBERS ☜

of each month, counting from last September, and would advise those who want a complete series of this journal to send AT ONCE for any copies necessary to make their set complete.

BOUND VOLUMES.

Bound Volumes of 1881 are now ready for delivery. Sent postpaid to any part of the United States upon receipt of $2.50.

A limited number of Bound Volumes of 1880 on hand, to be had at the same price.

Illness of the Editor.

It is with much regret that we announce the serious illness of the senior editor of this journal. On the 19th of February he contracted a very severe cold, which in a few days settled into a serious attack of pneumonia. Erysipelas soon after made its appearance, and for a while it was in much doubt whether he would survive the disease. Skillful doctors and tender nursing, aided by a robust constitution, gained the mastery, and we are happy to announce that upon the date of this issue, he is well enough to sit up and converse with his friends.

We cannot but thank his many professional brethren who have called upon him during his sickness for the kind welfare they have expressed for his recovery. From the nature of the disease they have not been permitted to see him, but the kind words left on their cards will be the source of much gratification and pride when he peruses them, when fully restored to health. It shows the esteem in which he is held when scores of inquiries have been made each day upon his recovery.

We have done the best we could in this issue to keep up the high standard of this journal to which the senior editor has always endeavored to maintain since its inception. The earnest articles which have appeared month after month from the pen of the sick journalist will of course be missed. But we have the proud satisfaction of knowing that we have *tried* to approach the editor's style of writing, and hope that all shortcomings will be passed over. Our experience in the business department of this journal has been of much benefit to us in this emergency, and we lay this issue before our many readers, assuring them that with the large corps of writers we have at our command, and with the return of the editor to his usual good health, the great goal of his ambition will ultimately be reached; viz., the universal adoption of the CALIFORNIA ARCHITECT AND BUILDING NEWS by architects, mechanics, and the public generally, as the leading paper on the Pacific coast in regard to mechanical, architectural, and scientific matters generally.

We are happy to state, just before going to press, that the editor has so far recovered as to be able to sit up and converse freely with his friends. His physicians assure us that he is entirely out of danger, and in the course of another week will be able to appear again in his sanctum.

When oil is heated sufficiently in a closed vessel from which the air is excluded, it turns to gas, which occupies many times the bulk that the oil did. This is the philosophy of pop-corn, and explains its tendency to burst into curious forms on being roasted.

"Eastlake."

Desiring to convince himself that the *monstrosities* denominated "Eastlake" by some of the architects in this city had no connection whatever with the unique and beautiful designs projected by Charles L. Eastlake, of Leinster Square, London, the editor of this journal, forwarded to the gentleman whose name has been given to the "NEW STYLE," a copy of our criticism on said style (as published in October number, 1881), together with designs of so-called Eastlake houses. Mr. Eastlake kindly answered the letter with permission to publish his views.

"* * * *Judging from the specimens I have seen illustrated may be said to* BURLESQUE *such doctrines of art, as I have ventured to maintain by criticism of modern works, or deduced from the study of ancient examples.*"

The above quotation at once expresses the tenor of the letter, and his opinion of the samples sent to him of the travesties on his style.

We defer publishing the letter in full until our next issue, on account of the illness of the senior editor. He has spent much time and study on this subject, and we know his views will be much more acceptably received by the numerous readers, who look with pleasure to the monthly appearance of his earnest articles in this journal.

Pacific Coast Association of Architects.

The regular monthly meeting of this association was held in the rooms of the Art Association on Friday evening, March 3rd. Vice-President John Wright presided, in the absence of the President.

Mr. J. C. Cebrian was elected a member of the association.

The secretary was instructed to insert in the notices of the next meeting that the meeting would consider the advisability of at once becoming a chapter of the American Institute of Architects. Also that a nominating committee would be appointed for the purpose of selecting officers for the ensuing term.

Interesting remarks followed, in which all present took part, showing the benefit this association has already been in keeping up the dignity of the profession, and by a thoroughly understood schedule of rates, enable the client and architect to agree at once upon the value of service rendered.

Meeting adjourned to meet on the first Friday in April.

TO IMPROVE POOR DRAWING-PAPER.—To size poor drawing-paper, take 1 oz. of white zinc, 1 oz. of white soap, and ½ oz. of alum. Soak the glue and the soap in water until they appear like jelly, then simmer in 1 quart of water until the whole is melted. Add the alum, simmer again, and filter. To be applied hot.

CO-PARTNERSHIP NOTICE.

WOLFE & SON, ARCHITECTS.

From and after this date, my son, George H. Wolfe, will have an equal interest with me in the **ARCHITECTURAL BUSINESS**, *conducted by me singly for the past three years, under the firm name of Wolfe & Son. He will also have an equal interest in the* **CALIFORNIA ARCHITECT AND BUILDING NEWS.**

JAMES E. WOLFE.

San Francisco, March 1st, 1882.

Interesting to Architects.

Two decisions of interest to architects and builders have just been delivered by the French Cour d' Appel. The first is simply a reiteration of the principle so often affirmed by the English courts, that when a penal clause has been incorporated in a contract, obliging the contractor to pay a stipulated sum as ascertained damages for every day of delay beyond a fixed time, this clause must be sustained, as being the expression of the free intention of the parties, and the court can do no more than determine the actual number of days' delay chargeable to the contractor. The other decree applied to a case in which a dealer, who had furnished supplies to a sub-contractor for public work, on the bankruptcy of the sub-contractor applied to the principal contractor for his pay, on the ground that the agreement entered into on behalf of the State prohibited all sub-contracts, and provided that in case any such were made the principal contractor, together with his "caution," or forfeit money, should be held answerable for the work which he had delegated to another. The court held that this clause was intended simply as a guaranty to the State of the responsibility of the principal contractor, whether he made sub-contracts or not, and did not render him accountable to third parties, who had contracted with his sub-contractor, but between whom and himself there existed no legal relation.—*American Architect.*

Chimneys and Flues.

The importance of careful workmanship in the erection of chimneys is clearly demonstrated by the almost numberless conflagrations which from time to time have had their origin in "defective flues." Still these often-repeated warnings have but little effect upon the *careless class* of chimney builders, who are reckless to all after consequences, and rush their work through with no other concern than to reach payment for their labor.

There are doubtless hundreds, and perhaps thousands, of houses in San Francisco, and all large cities, which daily barely escape destruction by fire from the many unfilled joints in the brick-work of chimneys, particularly the cheaper class of buildings erected upon the economy principle, in the erection of which, for the sake of saving a few dollars, owners engage the *cheapest* man, asking no questions as to mechanical competency, beyond the volunteer statement of the parties that they "do first-class work," and with whom everything is first-class.

Nor do those who have suffered the loss of millions of dollars in payment of insurance policies exercise prudent concern in this connection. If there was a law compelling owners to produce the certificate of a competent chimney inspector, before an insurance company would accept risks, particularly upon frame buildings, fires from defective flues and chimneys would seldom happen.

Neither do owners of property sufficiently realize the risks that exist in connection with this feature of house construction. Contentment follows the laying up of bricks and mortar in the shape of a chimney, by all parties concerned, without any special practical anxiety in reference to the manner in which the work is done; and if the chimney builder is careless or incompetent, he may leave one or forty cracks and holes, either of which being sufficient, under certain circumstances, to furnish a means of communicating fire to the wood-work. Still these facts create no special or general attention; and the erection of defective chimneys and flues goes on daily, and thousands of conflagrations follow; and owners of property and insurance companies remain unconcerned, until fire after fire from this prolific cause destroys property, and insurance companies are called upon to foot the loss.

Security in this matter is both possible and practicable: first in the engagement of really competent masons to do the work—men who realize the contingencies involved in the careless laying of a single brick, or a single unfilled joint; and secondly, every chimney built should be plastered on the *outside*, as well as in the flues. The expense of this extra yet necessary precaution against defects would add but little to the cost of a building, and would afford positive security.

One Benefit from Dry Seasons.

The lands of this State most subject to drouth would never be provided with facilities for irrigation were it not for occasional dry years. These force irrigation problems to the front, and cause irrigating ditches to be built. We are undoubtedly indebted to dry years for all the irrigating canals and ditches that now exist in the State. Nor is this all. The land never gets a rest only when a dry year gives it one. It is constantly harrassed to produce the same crops, year after year. There is no rotation and no use of fertilizers. The quality of the land therefore rapidly deteriorates—an occasional dry year alone helps it, by giving it a rest. More tree and orchard planting is always done after a dry year, too, for the moisture-protecting and very beneficial aid of trees in warding off the effects of dry north winds, are always most plainly seen in a dry year. We do not mean to say that this season will be a notably dry year, for it will not be by any means. Present appearances indicates that we will have a full average harvest, taking the State as a whole. The crops look well in the Sacramento, Sonoma, Napa, and many other valleys. The rain which fell, came down in such gentle, soaking showers, that none of it was lost. The crops in the most of the San Joaquin Valley will be a failure, and the season will be a disastrous one for sheep and cattle in the most of the southern and southeastern counties. This, we believe, is the worst that can at present be said.—*Real Estate Circular.*

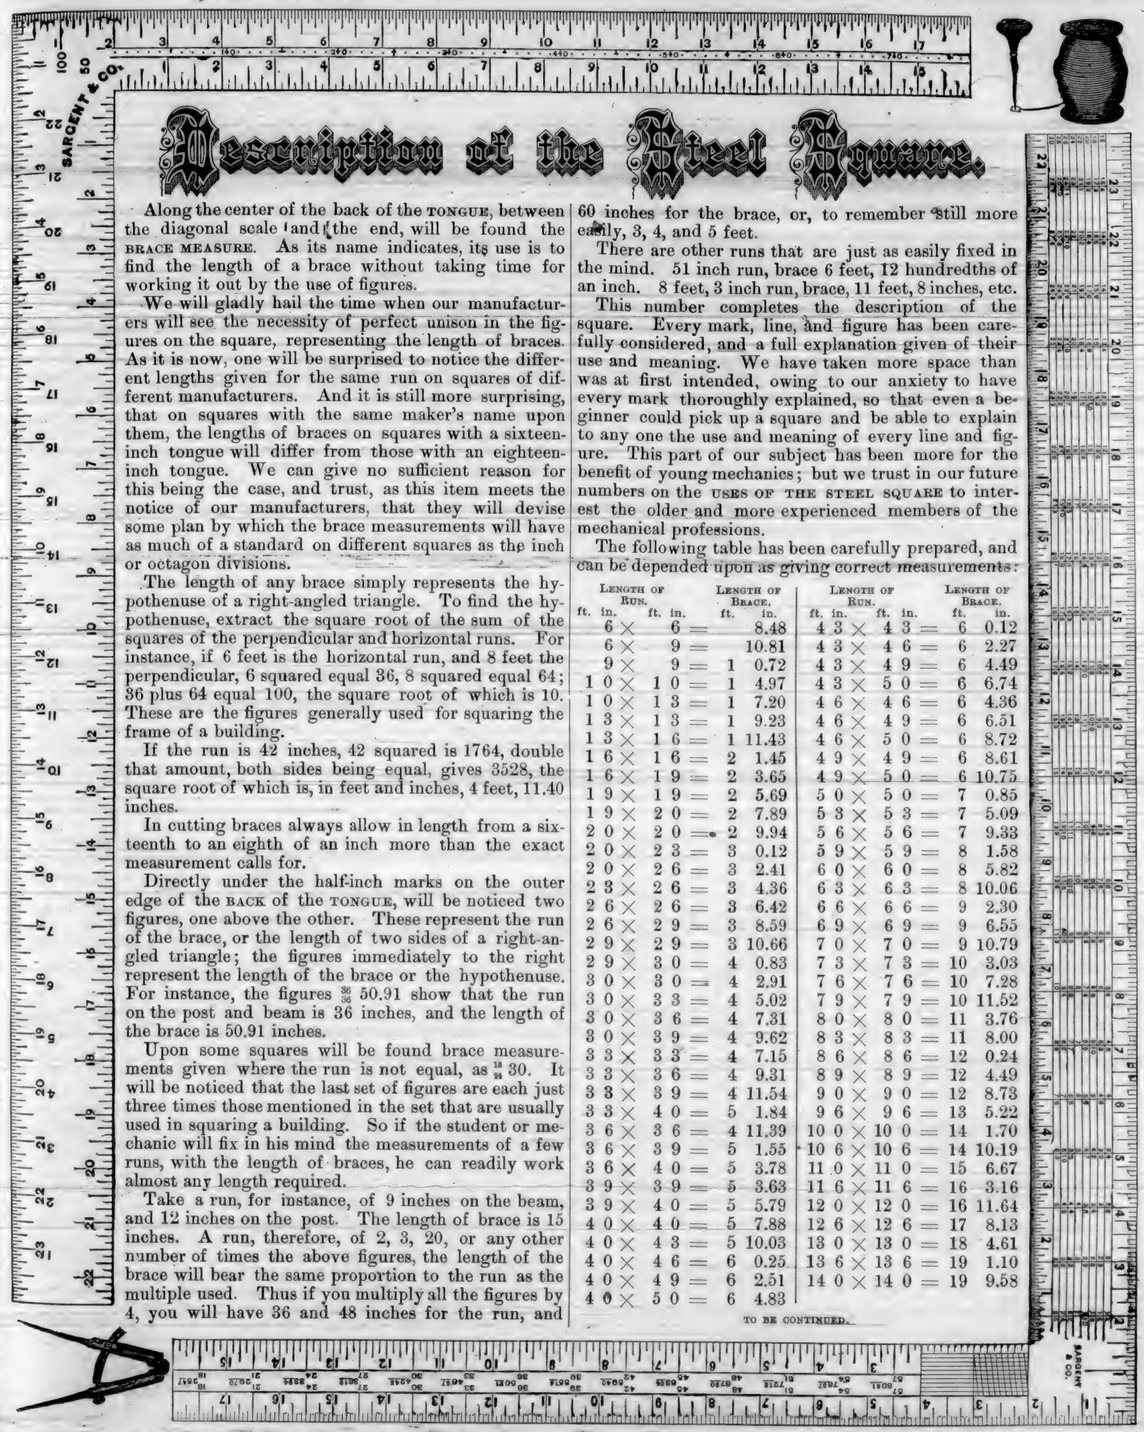
Puget Sound—The Mediterranean of the West and its Lumber Trade.

Puget Sound, Washington Territory, perhaps the least known in the East of all our important water surfaces, is the one for which its acquaintances claim the largest future fame. It covers an area of 2,000 square miles, with a breadth rarely exceeding ten miles, and has a coast-line of 1,500 miles. Its shores are bold and its water deep, and it is quite free from shoals and reefs. The large lumber vessels which frequent the sound are bothered to find good anchorage, scarcely less than a hundred fathoms of water appearing anywhere. So deep are the waters of this Mediterranean of the West, says a recent visitor, that a great commodore of the United States Navy once innocently almost ruined the chances of one of the Puget Sound towns for being the final terminus of the Northern Pacific Railroad, by taking his ship up to the town. On sounding the water for anchorage ground, he failed to find as little as thirty fathoms of water anywhere, excepting one place, and that so near the bank that there was danger of the ship going ashore when swinging with the tide. He had to depart and anchor at the other place, where there is a large natural bay, affording excellent advantages of the kind he was seeking. The pure water of this sound swarm with fish. There are eighty-five varieties, it is said. The salmon is the prince of fish here. The catch of salmon sometimes amounts to 40,000,000 pounds a year. A species of cod is also very abundant. It is dried and salted in large quantities.

The principal industry of the sound is lumbering. The timber comprises ash, dogwood, alder, white oak, maple, cottonwood, spruce, hemlock and laurel, among other varieties; but these are in limited quantities. The greater part of the timber is yellow fir and cedar. This vast fir forest is thought to be the finest tract of valuable timber land on the face of the earth. It covers an area of 32,000 square miles, according to the rough estimates which are current in the Territory. It is accesible from every point on the sound, and from the ocean coast for a vast distance southward. The proprietors of the logging camps fell their first trees so close to the shore that they could be made to fall directly into the water if desired. The yellow fir is from 150 to 300 feet high, the trunks being from 5 to 12 feet in diameter at man's hight from the ground. The first lumbermen cut only the five and six foot trees. The saw-mills could not handle logs which were larger than that. Even yet there is no saw-mill on Puget Sound which can saw a log that is more than eight feet in diameter. The consequence has been that at first, for many years, the axmen left the small trees and the very large ones; and a piece of timber land which has been cut over once presents the singular phenomenon of a collection of small and of gigantic trees, with none of medium size among them. Since the enlargement of the mills, some camps are sending their men over the ground a second time to fell the big timber. The firs are cut off about five or six feet from the ground. The butts are generally unsound.

It requires from half an hour to an hour to fell a good-sized tree. A large number of the fir tree trunks are unsound. The principal defect is what is called a "shake." It is a small track inside the tree, formed by the swaying of the tall tree in the wind. When such a crack forms, it soon becomes filled with the turpentine-like balsam which is characteristic of the fir. The woodchopper at work on a big tree is frequently astonished by driving his ax through one of these fissures and seeing several gallons of turpentine suddenly run out. If the tree, when felled, is found to be defective, it is left where it lies. If sound, it is cut up into logs from 30 to 130 feet in length, and hauled out of the woods. Sticks 150 feet long are sent out. The United States is exceedingly jealous of this vast tract of valuable timber land. It permits the timber to fall only into the hands of those who wish to do a legitimate business in logging. The regulations are quite strict, both as to keeping the land out of the hands of speculators, and as to the waste of timber. To buy a square section of timber land costs $1,600. The logger employs about six men and a team of eight oxen. He builds a rough camp and boards the men. His running expenses are about $35 a day, and he is able to get out of the woods about 30,000 feet a day. The rafts of logs are towed off to the neighboring saw-mill at a cost of $1.50 per thousand feet, and he sells them there at the rate of $6 per thousand feet.

The yellow fir is known in the East as Oregon pine or Puget Sound pine. It is a wood of great value, owing to its toughness and strength. The first cargoes of it were sent to San Francisco about twenty-five years ago. The length and beauty of the timber attracted the attention of Admiral Farragut, who caused tests of it to be made at the Mare Island navy yard. Still other tests were made at the navy yard in 1878, by Constructor Much, for the purpose of discovering the sizes of scantling required for building the United States screw steamer Manzanita with Pacific Coast woods instead of with oak. Tests have also been made recently in the oak. It is proved that yellow fir is fully the equal of Eastern white oak in tenacity, strength, and toughness. There is no doubt left upon the point, and yellow fir is now the universal building wood on the Pacific Coast.—*Scientific American.*



Description of the Steel Square.

Along the center of the back of the TONGUE, between the diagonal scale and the end, will be found the BRACE MEASURE. As its name indicates, its use is to find the length of a brace without taking time for working it out by the use of figures.

We will gladly hail the time when our manufacturers will see the necessity of perfect unison in the figures on the square, representing the length of braces. As it is now, one will be surprised to notice the different lengths given for the same run on squares of different manufacturers. And it is still more surprising, that on squares with the same maker's name upon them, the lengths of braces on squares with a sixteen-inch tongue will differ from those with an eighteen-inch tongue. We can give no sufficient reason for this being the case, and trust, as this item meets the notice of our manufacturers, that they will devise some plan by which the brace measurements will have as much of a standard on different squares as the inch or octagon divisions.

The length of any brace simply represents the hypothenuse of a right-angled triangle. To find the hypothenuse, extract the square root of the sum of the squares of the perpendicular and horizontal runs. For instance, if 6 feet is the horizontal run, and 8 feet the perpendicular, 6 squared equal 36, 8 squared equal 64; 36 plus 64 equal 100, the square root of which is 10. These are the figures generally used for squaring the frame of a building.

If the run is 42 inches, 42 squared is 1764, double that amount, both sides being equal, gives 3528, the square root of which is, in feet and inches, 4 feet, 11.40 inches.

In cutting braces always allow in length from a sixteenth to an eighth of an inch more than the exact measurement calls for.

Directly under the half-inch marks on the outer edge of the BACK of the TONGUE, will be noticed two figures, one above the other. These represent the run of the brace, or the length of two sides of a right-angled triangle; the figures immediately to the right represent the length of the brace or the hypothenuse. For instance, the figures $\frac{36}{36}$ 50.91 show that the run on the post and beam is 36 inches, and the length of the brace is 50.91 inches.

Upon some squares will be found brace measurements given where the run is not equal, as $\frac{18}{24}$ 30. It will be noticed that the last set of figures are each just three times those mentioned in the set that are usually used in squaring a building. So if the student or mechanic will fix in his mind the measurements of a few runs, with the length of braces, he can readily work almost any length required.

Take a run, for instance, of 9 inches on the beam, and 12 inches on the post. The length of brace is 15 inches. A run, therefore, of 2, 3, 20, or any other number of times the above figures, the length of the brace will bear the same proportion to the run as the multiple used. Thus if you multiply all the figures by 4, you will have 36 and 48 inches for the run, and 60 inches for the brace, or, to remember still more easily, 3, 4, and 5 feet.

There are other runs that are just as easily fixed in the mind. 51 inch run, brace 6 feet, 12 hundredths of an inch. 8 feet, 3 inch run, brace, 11 feet, 8 inches, etc.

This number completes the description of the square. Every mark, line, and figure has been carefully considered, and a full explanation given of their use and meaning. We have taken more space than was at first intended, owing to our anxiety to have every mark thoroughly explained, so that even a beginner could pick up a square and be able to explain to any one the use and meaning of every line and figure. This part of our subject has been more for the benefit of young mechanics; but we trust in our future numbers on the USES OF THE STEEL SQUARE to interest the older and more experienced members of the mechanical professions.

The following table has been carefully prepared, and can be depended upon as giving correct measurements:

Length of Run.				Length of Brace.		Length of Run.				Length of Brace.	
ft.	in.		ft.	in.		ft.	in.		ft.	in.	
6	×	6	=	8	48	4	3	× 4 3 =	6	0	12
6	×	9	=	10	81	4	3	× 4 6 =	6	2	27
9	×	9	=	1	0 72	4	3	× 4 9 =	6	4	49
1	0	× 1 0	=	1	4 97	4	3	× 5 0 =	6	6	74
1	0	× 1 3	=	1	7 20	4	6	× 4 6 =	6	4	36
1	3	× 1 3	=	1	9 23	4	6	× 4 9 =	6	6	51
1	3	× 1 6	=	1	11 43	4	6	× 5 0 =	6	8	72
1	6	× 1 6	=	2	1 45	4	9	× 4 9 =	6	8	61
1	6	× 1 9	=	2	3 65	4	9	× 5 0 =	6	10	75
1	9	× 1 9	=	2	5 69	5	0	× 5 0 =	7	0	85
1	9	× 2 0	=	2	7 89	5	3	× 5 3 =	7	5	09
2	0	× 2 0	=	2	9 94	5	6	× 5 6 =	7	9	33
2	0	× 2 3	=	3	0 12	5	9	× 5 9 =	8	1	58
2	0	× 2 6	=	3	2 41	6	0	× 6 0 =	8	5	82

TO BE CONTINUED.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

The Timber Supply of Europe.

From an approximate summary of the timber production and trade of Europe, as given by the *Journal of the Agricultural Society of France*, may be drawn some lessons which may be of benefit in showing the dangers threatening our timber supply, and the advantages of an intelligent public policy of preservation. A man in business cannot be expected to sacrifice himself for the benefit of posterity, but the Government should see to it that such great resources should not be sacrificed in one generation. The policy of Austria has almost a counterpart in that of this country. Sweden and Norway have exhausted their oak as we almost our walnut, and, according to the *Journal*, their pine is going the way of ours. The following are the figures given by the paper mentioned above: Sweden and Norway, which still do a large export trade in deals, are now compelled to buy their oak in Poland; and in Russia the forests along the shores of the Baltic, in Finland, and in the southern provinces, are rapidly thinning, so that the forest produce of the empire is now only one in ten. There are about 34,000,000 acres of forest in Germany (of which 20,000,000 are in Prussia), estimated to be worth £500,000,000, and bringing in an income of £10,000,000 per annum. The State forests are taken great care of in all parts of Germany, in Prussia alone £100,000 being spent every year in replanting; yet the imports of timber exceed the exports by over 2,000,000 tons. The oak and the beech are the kinds of trees which do best in Denmark, but the timber trade of that country is very small. Austria and Hungary have upwards of 43,000,000 acres of forest; but in Austria proper the State does not possess more than seven per cent. of the wooded area, as owing to the wasteful policy of the Ministry of Finance from 1855 to 1872 more than 5,000,000 acres were sold for sums so far below their value that there was a popular saying in Vienna, "If you want to become rich, buy State forests." The speculation came to an end in 1873, but Austria is now obliged to buy most of her timber in Bosnia and Montenegro. Servia and Roumania have some very fine forests; but Italy, though her forest area extends over nearly 14,000,000 acres, does not do much in the way of a timber trade, as the roads leading to the forests are so bad that it is almost impossible to move the timber when cut. Much the same is the case with Spain, which has 8,500,000 acres of forest; while Portugal, which has only 1,000,0000, finds a good market for her timber. Sweden and Norway export about £32,000,000 worth of timber every year, and at this rate their fine forests will soon be exhausted.—*North-western Lumberman.*

Polishing Wood.

Turned articles must be brought to a fine, smooth surface with the finest sand-paper, and the direction of the motion should be occasionally reversed, so that the fibers that are laid down by being rubbed one way may be raised up and cut off. To apply the polish, which is merely a solution of shellac in alcohol, take three or four thicknesses of linen rag, and place a few drops of polish in the center; lay over this a single thickness of linen rag, and a drop or two of raw linseed oil over the polish. The rubber is then applied with light friction over the entire surface of the work, while revolving in the lathe, never allowing the hand or mandrel to remain still for an instant, so as to spread the varnish as evenly as possible, especially at the commencement, and paying particular attention to the internal angles, so as to prevent either deficiency or excess of varnish at those parts. The oil in some degree retards the evaporation of the spirit from the varnish, and allows time for the process; it also presents a smooth surface and lessens the friction against the tender gum. When the varnish appears dry, a second, third, and even further quantities are applied in the same manner, working, of course, more particularly upon those parts at all slighted in the earlier steps.

Flat surfaces are polished in a similar manner. The wood must be filled, as it is called, and for this nothing is better than whiting, colored so as to resemble the wood, and kept dry. Rub the latter with linseed oil, and then sprinkle it with whiting. Rub the latter well in, wipe it off carefully and give time to dry. This is far superior to size.

The polisher, however, generally consists of a wad of list, rolled spirally, tied with twine, and covered with a few thicknesses of linen rag. Apply a little varnish to the middle of the rubber, and then inclose the latter in a soft linen rag, folded twice. Moisten the face of the linen with a little raw linseed oil, applied to the middle of it by means of the finger. Pass the rubber quickly and lightly over the surface of the work in small circular strokes, until the varnish becomes nearly dry; charge the rubber with varnish again, and repeat the rubbing till three coats are laid on, when a little oil may be applied to the rubber, and two more coats given it. Proceed in this way until the varnish has acquired some thickness; then wet the inside of the linen cloth, before applying the varnish, with alcohol, and rub quickly, lightly, and uniformly the whole surface. Lastly, wet the linen cloth with a little oil and alcohol, without varnish, and rub as before until dry. Each coat is to be rubbed until the rag appears dry, and too much varnish must not be put on the rag at one time. Be also very particular to have the rags clean, as the polish depends in a great degree upon keeping everything free from dust and dirt.

Outside Ladder Accident.

We have been consulted, during the month past, in reference to our opinion in the matter of one of those occurrences which several months ago we predicted would occur, and which we again predict will be a matter of frequent occurrence hereafter. The responsibility for a dislocated thigh is the issue. Our answer: the injured party must bear both the pain of the accident and all consequent expenses. The case is this: A certain owner engaged a "roofer" to do some roof work on a building, the approach to which was by one of those *miserable traps*, an outside wooden ladder, secured to the wall of the building with nails, and the rounds of the ladder itself secured to the uprights in the same manner. The roofer proceeded with and completed his work, and after having left the roof as completed, he returned and again ascended the ladder for the purpose of recovering a chisel, which had been forgotten, and in his final descent of the ladder one of the rounds gave way, and the roofer fell, with a dislocated thigh as the result. Had the fall occurred during the execution of the work, the owner might have been responsible; but inasmuch as the injured party returned to the roof of his own accord, and for purposes in which the owner had no interest, he, the broken-thigh man, cannot recover damages from the owner.

This is but one of many cases that will occur from like cause. It needs no spirit of prophecy nor special inspiration to foretell coming events in this connection. It is simply a matter of common sense—mechanical judgment. Such ladders are seldom made with any special regard to strength and firmness. Two pieces, of 2 x 3 or 2 x 4 inches, for uprights, of Oregon pine lumber, with 1 x 3 or 1 x 4 inch rounds or slats, joined into the uprights, and nailed generally with 10-penny, but sometimes, when the larger nails are scarce, 8 or 6-penny, whichever is most acceptable, are used, without any consideration of the strength or holding value of either, so that *two* nails are represented in the face of the slats. When new, such ladders are barely safe for the purposes for which they are intended; and when subjected for a few years to the effect of natural wear and tear, exposure to rains, dews, sun, etc., they certainly cannot be, and they are not, safe means for *perpendicular* ascent up the walls of two or three story buildings, particularly as the uprights are almost always nailed close against the walls, so that parties ascending are compelled to take hold of the slats. And in cases of older persons, whose knee-joints may be in any degree weakened by age or infirmities, the hands and arms are made to do service in drawing the body upward, and this extra pull above increases the danger. Men advanced in years, and those of more than one hundred and forty pounds avoirdupois, should never attempt to climb these neck, back, leg, or arm breakers. The removal of every one of these risky wooden affairs should be compelled by law, and their construction hereafter prohibited. Well-made, wrought-iron ladders, firmly secured, should alone be permitted where outside ladders are a necessity. Chief of the Fire Department Scannell should interest himself in this matter, or some day or night he may be required to take care of one or several firemen with broken limbs, or worse, caused by attempts to reach roofs of buildings by the dangerous means under notice.

Contractors and Architects.

The demands of the contractors for certain changes in the printed agreements which are furnished by architects for signature, previous to the commencement of work, have not as yet been agreed to. In fact, it is doubtful if the architects will agree to the conditions sought to be imposed at all. One of them is that in case of dispute for extra work arbitrators be appointed—one by the contractor, one by the architect, and another by the proprietor of the building. This the architects claim would cause a great deal of useless labor and annoyance. They claim that in all the leading cities the matter of extra pay is left in the hands of the architect, and they do not see any necessity for having any exception made in the case of London. In the mean time the contractors have had a lengthy set of rules drawn up by W. R. Meredith, Q. C., and submitted to the architects. It is stated they will not tender for any work offered by those architects who refuse to agree to the terms laid down by them.—*London (Ont.) Gazette.*

Dovetail.

Is the generally received derivation of this technical term correct? I do not remember to have seen any other suggested, and turning to the only English dictionary within ready access, I find: "Dovetail, joint in form of a dovetail spread." It seems probable that the word is no more derivable from "dove" than "rabbet"—another term of carpentry—from "rabbit," but is one of many familiar technical terms borrowed from the French. The French *douve* (which appears in German as *daube*) is a cask-stave, and is connected, Littré says, by Ducange with L. Latin *doga*, a vase, a cup—the transition from *doga* to *douve* being normal. So "dovetail," if *douve-taille* as surmised, would have meant such "cutting" (French *tailler*) as was applied to cask-staves. Whether such staves are precisely dovetailed, affects the question but little. Their joints were necessarily water-tight, and thus a very close joint may well have been called a "dovetail." It is right to add that the compound word *douve taille* (possibly obsolete) does not appear in any of the several French dictionaries I have consulted.—*Notes and Queries.*

How to Make the Chinese Law Effective.

It has been claimed by many that it will always be impossible to exclude the Chinese from this coast, no matter what law may be passed by Congress. It is claimed that though a law of Congress may limit the number of Chinese landing at ports of the United States, that law cannot be made to apply to the ports of Mexico or British Columbia. It is said that, when they find they cannot land in one of the United States ports they will land either in a British Columbian or Mexican port, from whence they can cross the line into the United States. Such evasion of the law can hardly be accomplished however, for three reasons: first, because neither the British Columbian nor Mexican authorities will permit the wholesale landing of the Chinese on their shores. Their presence is no more desired in either of those countries than it is here; and second, even if the Chinese could land in that way, and without opposition steal across the line, the cost of their reaching almost any point in California from the foreign point they were launched at, would of itself be a prohibition to their entrance. The Pacific States should at once adopt the same rule as that adopted in Australia. That rule makes it incumbent on any Chinaman who has been in the country before the passage of the excluding act, to have a certificate stating that fact, which he is required to exhibit at all times on demand of a designated city or county official. If it is found that he is an interloper, he can be confined and kept at work until an opportunity occurs to remit him to his own country. No one seems to think that the Australians have done anything very savage or uncivilized in passing thic law; but when a similar law is proposed on the Pacific coast, the majority of the Eastern people and papers cry aloud that it would be uncivilized and barbarous, and is proposed solely to satisfy the hoodlum element of the Pacific Coast. The fact that the voters of the State have once, by an overwhelming majority, decided against Chinese immigracion, seems to count for nothing with the Atlantic people and papers.—*Real Estate Circular.*

The Trials of an Architect.

Another example of the trials which afflict architects is furnished us by one of the profession. This gentleman, with his partner, was commissioned to build a small structure for a certain town, and the appointment was announced in the local journals. Soon after, one of the town council which appointed the architects in question was approached by the city engineer of a neighboring community, who desired him to lay before the next meeting of the council a sketch-plan, which he would furnish without charge, for the chance of having it preferred to those already accepted. The councilor reminded him that the architects of the building had been already appointed, to which he replied that he knew it, but thought he could design a building which would be cheaper than any that Messrs. A and B would draw, and his charges for his services would moreover be less than those of the actual appointees. Even this combination of merits failed to satisfy the councilor, who declined to act as the surveyor's messenger in the case. Our correspondent suggests that an engineer employed and paid at the public expense might be expected to occupy his leisure moments in perfecting himself in his own profession, for his own and his employers' good, rather than in attempts to thrust himself, uninvited, into business which belonged to other people.

To this we can only reply that the restrictions laid upon professional men acting under public employment differ greatly, so that there may be no reason why the city surveyor of X should be forcibly prevented from engaging in any employment which suits him during his spare hours, and if he feels an irresistible attraction toward the practice of architecture, that may be enough to justify him in neglecting his opportunities for advancement in his own profession. Moreover, tastes, as well as men, vary in the selection of modes for securing business as well as in other things, and such a method of solicitation as that said to have been adopted by the individual in question, while it would seem intolerably contemptible and humilating to some delicately organized persons, is regarded by others as a praiseworthy manifestation of business talent and "push." Whatever may be the merits of this particular case, the rule that the better class of achitects will occasionally have to struggle for their commissions with the cheap and hungry ones who hang about the flanks of building committees and public bodies is not likely to be soon changed. There will always be in architecture, as in all other professions, men who for one reason or another can afford to work at a lower price than their fellows, and it is likely that their will also always be clients who will consider it an economy to employ them, and it usually happens that the latter get about what they pay for, while the former have no reason to be dissatisfied.—*The American Architect.*

Workmen in an Employer's Shop.

Every man in a workshop ought to constitute himself the guardian of his employer's property, and not only should he avoid waste himself, but as far as practicable he should discourage it in others. If this were done, millions of dollars would be saved to the country; a much larger percentage of profits would go into the pockets of the employer; manufacturers would be enriched, and, in the end, the workmen would be proportionately benefited. Strange that these simple facts should have so little weight; but so it is. Waste by another is cruel to the man who has to pay, it does not, cannot benefit the the person guilty of it, and it is a dead loss to the nation. And every scrap of material so destroyed makes the product more costly, and consequently dearer. In the interest of workmen, it is important that these facts should be borne in mind. Wages bear a relative proportion to cost of raw materials, and both combined determine the price of commodities; the cheapness of the latter augments their sale, increases their production, enhances the demand for labor, and tends to keep up wages; the reverse is equally true. If, therefore, an obvious duty is neglected or carelessly performed, the men mainly responsible ultimately suffer, and that suffering will be in an exact ratio to that which produced it.

One great remedy for the losses incurred by waste is a closer supervision of every detail of the undertaking, whatever it may be. This, however, involves extra expense. If the men can contribute to a saving in this respect, they will indirectly reap the advantage. To overlook this fact shows a lamentable ignorance of the internal economy of a workshop, and of the forces and influences always at work for the purpose of bringing about a given result. And the men who complain of strict supervision are just those who need it most, and who, without it, would render large contracts next to impossible, for the simple reason that they would not pay, and could not therefore be executed. Many a builder and contractor has been ruined by the wastefulness of his employees and negligence of his foreman. A careful man is a jewel in a workshop.—*Builder and Wood Worker.*

Steel Square Problems.

A new work explaining the uses of the Steel Square. Sent post-paid to any address upon receipt of 50 cents.

Heating Buildings.

In spite of the professions of our heating and ventilating engineers, the warming of public buildings is a thing which is not properly understood. It is an easy matter to set up fire-places or radiators or coils of steam pipes, in a number of rooms, and to fancy that by so doing a building is efficiently warmed. In nine cases out of ten such proceedings only cause greater complaints than before; not of cold but of draughts, the reason being that as soon as the door of any one of these rooms is opened a current of cold air from the colder passage flows into the room, creating a draught which is worse than any degree of steady cold. A very little reflection should show authorities on these matters that unless the passages, halls, and corridors of buildings are warmed as well as the rooms there must be a continued inequality of temperature which nature strives to remedy through the agency of draughts. If a large building is to be warmed by any of the means indicated, it must be warmed all through, for it is just as important to apply heating arrangements outside the rooms as inside.—*Industrial World.*

The wire cable is now doing regular work on State street, Chicago, and the horseless cars are ceasing to create sensation on their regular trips. The cable has been laid on the length from Twenty-first to Thirty-ninth street, and is about in actual operation. The grip car drivers succeed in running without trouble from one cable to another where breaks occur, and on the straight track everything seems a success. The cable has been laid around the Madison street corner, and so round the corner to complete the circuit, but cars are not yet running on this length—the problematical one of the service. To grip the the cable to traverse a sharp curve successfully is the only serious question as yet in wire cable traction, and while the authorities are quite sanguine, it is a question whether the present operation will not prove more tentative than otherwise. Since the above writing, a grip car is reported to have been successfully run round the corner, stopped, and started at frequent intervals to show that there were no fortuitous circumstances at work, and the jumps made between the cables to get on the main line again. It will probably be some days before traffic is carried around the curves, as there are a few minor changes to be made. Horses are therefore used at this point for the present.—*The American Engineer.*

An interesting discovery is reported from Pola, the chief naval station of the Austrian empire, and formerly a station of the Roman fleet. Near the huge amphitheater, only second to the Coliseum in size and massiveness of construction, some workmen were lately engaged in digging an ice cellar for the use of the squadron and the naval arsenal, when, at about a yard's depth from the surface, they came upon a statue nine feet three inches in hight, representing a Roman emperor, and in a state of almost perfect preservation. This effigy, executed in Grecian marble of the finest quality, is stated to be the most beautiful and highly finished effigy of its kind in existence. It has not as yet been recognized as the potrait of any particular emperor, but would appear to be rather an ideal or typical presentment of the Roman Cæsar. It is supposed that this noble statue originally adorned one of the niches of the vestibule belonging to the theater built by Augustus Cæsar in honor of his daughter, Julia, and bearing her name.—*The Tradesman.*

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

[While this column is open to all, farmers as well as mechanics, engineers as well as architects, we would call particular attention to one and all to have their questions and the information desired to be in accord, as far as possible, with the interests of this journal and for the carrying out of those principles for which the only monthly of its kind this side of the continent, was established. We will endeavor to answer all questions in a fair and impartial manner, and if it becomes necessary, will furnish cuts for the illustrations of any problem, provided we regard the solution thereof as beneficial to the majority of our readers. We would urge upon our patrons the necessity of being pointed in their questions, concise in the language used; let the writing be distinct, and one side of the paper only to be used; give full name and address, and particularly mention if their proper name shall be used.

We want it distinctly understood that the responsibility of signed articles rests with the authors.

Correspondents will please direct all communications to the business manager of this journal—240 Montgomery street, rooms 12 and 13.]

BUSINESS MANAGER OF ARCHITECT: In reading works on architecture, I find that mortar as prepared by the ancients was much more durable than that in use at the present time. How was mortar made in early times? Can you give me a list of "*the lost arts*"? L. R., Berkeley.

ANS.—"The ancient masons were so very scrupulous in the process of mixing their mortar, that it is said the Greeks kept ten men constantly employed for a long space of time to each basin; this rendered their mortar of such prodigious hardness, that, Vetruvius tells us, the pieces of plaster falling off from old walls served to make tables.

It was a maxim among the old masons to their laborers that they should dilute the mortar with the sweat of their brows; that is, labor a long time, instead of drowning it with water to have it done the sooner.

The weakness of modern mortar, compared to the ancient, is a common subject of regret; and many ingenious men take it for granted that the process used by the Roman architects in preparing their mortar is one of those arts which are now lost, and have employed themselves in making experiments for its recovery.

But the characteristic of all modern artists, builders among the rest, seems to be to spare their time and labor as much as possible, and to increase the quantity of the article they produce, without much regard to goodness; and perhaps there is no manufacture in which it is so remarkably exemplified as in the preparation of common mortar."

We will answer the second question in a future issue.

We received a communication from W. M. B., of River View, in regard to chimneys. It is too long for publication. He takes the stand that the throat of a chimney should be smaller than the number of inches contained in a horizontal section of the flue. We think our correspondent is at fault in this regard, as the frequent rushes of cold air into the chimney from the opening of doors, etc., sends a gush of smoke into the room, by obstructing the upward current of rarified air. We will condense the article and publish it in a future issue.

BUSINESS MANAGER OF ARCHITECT: A claims that a brick wall laid with the *Flemish bond* is stronger and therefore more preferable than the *English bond*. B claims that it is the appearance alone of the former that gives it the preference. Which opinion is the more correct?

C. C. Sacramento.

ANS.—The *Flemish bond* presents the neater appearance; the *English bond* being the stronger. The former was introduced into England in the time of William and Mary, and from its neat appearance was so generally introduced that today it is very seldom that the old English bond is to be seen.

(The disposition of bricks in a wall, of which every alternate course consists of headers, and of which every course between every two nearest courses of headers consists of stretchers, constitutes *English bond*.

The dispositions of bricks in a wall (except at the quoins) of which every alternate brick in the same course is a header, and of which every brick between every two nearest headers is a stretcher, constitutes *Flemish bond*.)

GLASS ROOFING.—In a paper published in Germany by the Hanover Society of Engineers and Architects, the comparative advantages and disadvantages of glass roofing are thoroughly considered. Hail, it appears, is not so damaging to such structures as is commonly supposed. It is seldom destructive of glass an eighth of an inch thick, and a thickness of a quarter of an inch is almost absolutely safe. The use of glass more than half an inch thick, however, has proved objectionable for roofing purposes, as it is said to be liable to spontaneous fracture.

Although the wealth of Great Britain is nearly double that of the United States, this country leads in production, while the value of manufactures is about equal in the two countries.

The process of whitening sugar was discovered in a curious way. A hen that had gone through a clay puddle meandered thence into a sugar-house. She left her tracks on a pile of sugar. It was noticed that wherever her tracks were the sugar was whitened. Experiments were instituted, and the result was that wet clay came to be used in refining sugar.

A writer mentions a peculiarity of newly tempered circular saws, which, when laid down to cool, commence to hum, and if not quickly replaced in the furnace will crack. The humming begins in a low musical key, and rises in tone until it ends in a snap. The saw does not always crack through from the eye to the perimeter, and it never does so if it is got into the furnace while humming in a low tone. If the crack proceeds but a part of the way, it is from the bottom of a tooth or space and toward the eye. Saw makers do not seem to be able to explain this singular and costly phenomenon.

There is constantly great danger of fire in the use of close cooking-ranges on the large scale now so common in eating-houses, great warehouses, and other places. These stoves give out an enormous heat, and are usually connected with old flues, having only four inches of brickwork round them. The walls surrounding the ranges, or furnaces as they might be called, become so heated that it is in many cases impossible to bear the hand on them, and all the adjoining woodwork becomes in course of time converted into a species of tinder, which blazes up to an enormous extent on the application of a spark.

The yield of California coal oil is increasing to such an extent that exports are likely, shortly, to take place to China, Japan, Australia, and Mexico.

TO RESTORE SPOTTED VARNISH.—If the varnish has been blistered by heat or corroded by strong acids, the only remedy is to scrape or sand-paper the article, and revarnish. Spots may often be removed by the following process: Make a mixture of equal parts of linseed oil, alcohol, and turpentine, slightly moisten a rag with it, and rub the spots until they disappear. Then polish the spot with ordinary blotting-paper. Varnish injured by heat can hardly be restored in any other way than by removing it and applying a fresh coat.

In a paper on "The White Pine and the Lumber Industry of Michigan," says the *Quebec Chronicle*, "the writer shows that the quantity of pine timber in that state has decreased from 135,000,000,000 ft. on 20,000,000 acres of land to 35,000,000,000 ft. on 10,571,000 acres. Some 5,000,000,000 ft. are now annually taken away, so that in seven years the supply will be exhausted. It almost seems a despairing task to hope ever to raise forests for another such an enormous production, and science will have to devise other materials as a substitute for wood."

The *North-western Lumberman* gives some colossal figures covering the product of shingles. It works out the problem that 800,000,000 to 1,000,000,000 ft. of logs are yearly made into shingles; and, allowing 5,000 shingles for each 1,000 ft. of logs, the output for eight years ending 1880 was exactly 21,229,391,485 shingles *not a fraction of a shingle more or less!*

TO BORE HOLES IN PORCELAIN.—It is sometimes necessary to bore one or more holes in porcelain, but the usual way of doing this is not easy. If, however, an ordinary drill be hardened, and kept moist with the oil of turpentine, it will easily penetrate the porcelain. The drill commonly employed in connection with scroll-cutting machines answers very well.

TO MAKE STENCIL INK.—A good and cheap stencil ink in cakes is said to be obtained by mixing lamp-black with fine clay, a little gum arabic or dextrin, and enough water to bring the whole to a satisfactory consistency.

Georgia pine is fast taking the lead as a finishing wood for office furniture, book-cases, and other useful purposes.

Our Illustrations.

Plate 1 is taken from Lakey's Village and Country Homes. It is a neat design for a suburban house, and can be built for about $5,000 to $7,000, according to finish.

Plates 2 and 3 show the elevation and interior view of a church recently built in this city. Messrs. Wright & Sanders are the architects.

Poison in Houses.

The ideas contained in the following remarks by Dr. Willard Parker of New York, are in such perfect accord with those always advanced by this *Journal*, that it is with pleasure we present them them to our readers.

"We are living in the wrong kind of buildings, and everything is wrong. Previous to the introduction of Croton water in this city, I don't remember a single case of diptheria. There were numerous cases of croup, and some which resembled diptheria, now and then. It is a disease which depends on malaria or bad air. It attacks families and goes through all the members. I had a friend, a physician, who depended on his cellar for all the air for his furnace. His six children were all stricken with the disease, and all of them died. And there are cases of that description everywhere. I say that if we have diptheria there is something wrong about our sewers. *If I were to build a house I would not have it connected in any way with a sewer.* I should construct a sort of annex, where I should have all the sewers, closets and all the pipes of the house. I suppose most of you would object to having a vault filled with dead bodies a few yards from your house, and connected with it by a pipe. Yet this is practically what we do with our sewers. Water is no protection from them—from the germs of poison which generate and live in the foul air. This matter demands our most earnest attention, for we are in a very critical and unhealthy condition."

THE FRANKLIN GIRDER.

THE MOST ECONOMICAL CONSTRUCTION

—OF ANY MODE AND AT A—

PRICE OF ABOUT ONE-HALF

OF THOSE IN COMMON USE

OF SAME LENGTHS,

—AND TO SUSTAIN—

EQUAL SAFE LOADS.

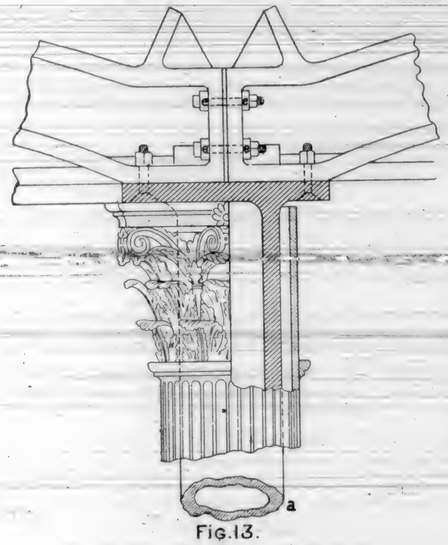

Fig. 13.

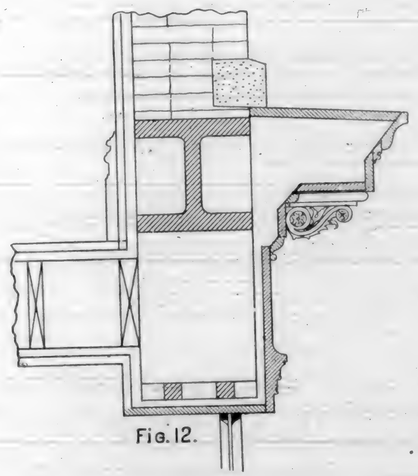

Fig. 12.

Employing Cast Iron compressively in every part, without taxing in the least its comparatively feeble tensile resistance,

AN OBJECT NEVER BEFORE ATTAINED.

Cast Iron possesses the enormous compressive resistance of 93,000 pounds to every square inch of cross section. The great objection to cast iron, caused by contraction of the parts in cooling, the heavier parts controlling and drawing away from the lighter parts, producing inherent weakness in tensile strain—does not in the least impair its strength when compressively employed. The Value of this Invention has been most favorably commented on by the scientific press of this country, London, Paris, and Germany. It has also been received with much favor by the Professors of Civil Engineering of many of the Colleges of this country, as well as Engineers engaged in Railroad and Bridge Construction.

These Girders for Architectural use are made of any length, and to sustain any required load—the safe to the breaking load being in the ratio as one is to three—and at a price of one-half of those in common use in this city.

A TWENTY-FIVE-FOOT GIRDER, with Brick work on it, is now in front of Premises, No. 231 First Street. Suitable to sustain 100 tons. Price, $200. Wrought Iron Girders to sustain same load and of same length, will cost double that Amount.

FIGURE 13

Represents the ends of two long Girders spanning the entire fronts, bolted together, and bolted to a Patent Fire-Proof Column—a Substantial Construction to resist Fire and Earthquake disturbance.

FIGURE 12

Shows the Girder encased with the Cornice, Frieze, and Soffit.

Prices given for any Length of Girder, and to Sustain any Weight.

P. H. JACKSON & CO.

2 CALIFORNIA ST., and 231 FIRST ST., SAN FRANCISCO.

To Property Owners, Architects, Builders, Iron Founders

—AND THE—

SETTERS OF ROUCH PLATE CLASS,

AND OTHERS.

It is the intention of the undersigned to maintain the rights vested in him, both by being the sole licensee, and by power of attorney for this coast by the owner of Thaddeus Hyatt's patent, granted August 27th, 1867, for illuminated basements, basement extensions, sidewalks, and roofs, which was reissued on September 27th, 1881, embracing sixteen claims; and all those who are in interest in whole or in part, in past and future infringements, are alike responsible for such acts. The manufacturer of the iron frames or castings for the lights and the furnisher and setter of the glass each of them are alike responsible for such violations. Hyatt made application for his patent in 1856, and it was granted in 1867, and his patent for novelty dates from the state of the art in 1856, and the exclusive right from August, 1867. The state of the art at the time of his first invention was: The basement of the buildings stopped at the face-line of the building, the same as the story above it, and like it, was closed between the piers by doors and windows, the area being an open space. The space underneath the sidewalk was used as a coal vault, and these vaults, at the building side, were bounded by the area wall, the area wall being curbed on three sides. By Hyatt's construction, this opening over the area way was covered by an illuminating roof, which was also a pavement to walk on, and becomes a bond or bridge to unite the basement and the space under the sidewalk, and lighting them by both vertical and angular rays of light, making by such construction an illuminating roof suitable to be walked upon, extending over the extended basement apartment.

Hyatt, in his patent specifications, says that the only actual basement extension which he found that assimilated to his new device, was where the area way alone was taken into the basement, and not the vault beyond it; and this areaway was covered with a skylight which was above and not on a level of the street, and it was set on an incline against the building. Then the sky-light was cut off from the sidewalk by an iron railing. A sky-light is a shield against the weather, a covering to an opening in a roof. The iron railing to the sky-light shows the weak and dangerous character of such structures. Besides, the iron railing was a barricade to the doorways of the building. The following claims on Hyatt's late reissued patent will best explain who are infringers.

THE BASEMENT EXTENSION IS COVERED BY HYATT'S PATENT AS FOLLOWS:

CLAIM 9. Buildings in which the basement is enlarged by union of the vault or coal-hole space, as an open chamber, and uniting or combining the two with the basement, substantially as and for the purpose herein described.

BUILDINGS IN WHICH THE AREA SPACE IS MADE TO BECOME A PORTION OF THE BASEMENT AS FOLLOWS, IS COVERED BY THIS PATENT:

CLAIM 8. Buildings in which the area space is made to become a portion of the basement by means of a water-tight roof of iron and glass, constructed as a platform or stoop to be walked over, substantially as and for the purposes herein set forth and illustrated.

CLAIM 7. Buildings in which the approaches over the areaway to its doorways from the sidewalk or traveled footway of the public street are formed by means of a solid water-tight translucent bridging of iron and glass, which serves the double purpose of stoop and roof, substantially as and for the purposes set forth and illustrated.

CLAIM 6. Improved buildings made by combining illuminating roofs and roof pavements as build appliances, with the main structure of the building as integral portions thereof, substantially as and for the purposes herein set forth and illustrated.

CLAIM 5. Illuminating roofs and roof pavements as building appliances, formed by combining perfected vault-covers or illuminating-tiles as a new building material, substantially as and for the purposes herein set forth and illustrated.

CLAIM 4. An illuminating-tile as a new building material, constructed substantially as and for the purposes herein set forth and illustrated.

CLAIM 11. Buildings in which the sunk areas are covered or roofed with iron and glass in stoop or platform shape for being walked over, where the metallic portions are formed, joined, and made water-tight by means of rising lips or water-backs, and by means of nosings made with an overlap or drip, substantially as and for the purposes herein set forth and illustrated.

CLAIM 14, Buildings in which the sunk areas are roofed over with iron and glass in stoop or platform manner for being walked over, where the areal light-space is enlarged by the employment of an iron girder, beam, or supports laid parallel with the face of the building, in lieu of an area wall and coping, substantially as and for the purposes herein set forth and illustrated.

CLAIM 15. An illuminating-roof of metal and glass, where the metal surface or plate that carries the glasses, and in which they are fixed and made water-tight, forms the general strength as well as roof-surface, in combination with the rafters, supports, or framing, the construction being such as to secure the two-fold object of equalizing and distributing the the strength of the iron while equalizing and distributing the light of the glasses, substantially as herein set forth and illustrated.

CLAIM 16. All illuminating step-roof composed of glass and metal—that is to say, where the metal and glass are composed into illuminating-sills and illuminating-risers, and these are again combined to form an illuminating-roof—substantially as and for the purposes herein set forth and illustrated.

THADDEUS HYATT.

Witnesses:
JUSTUS BRAUER,
T. C. BRECHT.

It will be seen that these claims embrace, first, the incorporating the area space, also the space under the sidewalk, as being Hyatt's invention and secured by his patent.

It will also be seen that the use of rough plate-glass, no matter what size or shape, used over the basement extension as described, is entirely covered by the patent, and the maker of the iron frames for these tiles, also the furnisher and setter of the glass, and every party in interest, including owner and architect, are equally liable for the violation of the rights secured to Mr. Hyatt, and it is the purpose of the undersigned to maintain, by suit at law, parties in such interest, both in the past and in future infringements.

P. H. JACKSON,

Sole licensee for the manufacture on the Pacific coast, and attorney for the owner of the patent.

HYATT'S PATENT FIRE-AND-BURGLAR-PROOF SKY-LIGHTS.

The public are requested to examine the large sky-lights now being erected on the rears of Mr. McCreary's building, corner Pine and Davis streets, also Senator Fair's building, corner Sansome and Pine streets. By the use of these heavy sky-lights, which are both fire and burglar proof, *no extra charge in rates is made by the insurance companies than if no sky-lights were used,* as they are not destroyed by fire as the wood and sheet-iron sky-lights in common use. Besides, the occupant of the premises may feel his goods are safe from robbers during the time the building may be closed.

There are many deep stores in this city that are much in need of light, and by an addition of these sky-lights all light can be obtained, besides security against theives is maintained.

The appearance of the sky-light, as seen from the front of the store when the sun is on it, glistens with the thousands of hexagon lens. The Cosmopolitan building, as altered, has these sky-lights on the rear of the deep stores.

SAN FRANCISCO.

Fire Escapes.

Since the recent fire in New York, by which several lives were lost, a great deal of energy has been expended in devising means of escaping from burning buildings. According to various individual views the fire service should be converted into a brigade for carrying portable fire escapes; buildings should be provided with fire escapes of all forms and devices, and they should be carried around as the personal property of the individual. Inventors are setting up fire escapes and inviting the interested public to witness what a simple matter it is to escape when there is no fire, and in process of time—not a very long time—the business of the patent office will feel the effect of the present agitation, and—what then? Unless all previous experience goes for nothing, things will settle down quietly until a repetition of the recent disaster shall bring about recurring activity and succeeding quiet.

There is nothing phenomenal in the present activity in this direction. It is simply a repetition of what has occurred in every instance of the kind during the past fifteen years, and will undoubtedly end in exactly the same way; that is, in adding to the record in the patent office by which the date of this fire, as of others in which human life was sacrificed that have preceded it, can be fixed with reasonable accuracy.

At best, fire escapes afford an unnatural means of leaving a burning building. The inmates are not accustomed to their use, and it is usually demonstrated that they are out of order when wanted, and often but little less dangerous—especially to women and children—than the fire itself. This is of course without saying that they have not in some instances been of value, but that, generally speaking, they have not been a success. To such an extent is this true that it would seem time attention was turned in some other direction for safety, particularly so since, notwithstanding the progress of the past twenty-five years, it seems to be a fact that the prospect of the inmates getting off with their lives, in the event of a fire in the average city building, is less to-day than ever before.

It does not matter how nearly or how entirely fire-proof the outside of a building may be, since fires by which lives are sacrificed, as a rule, originate in the interior.

The fact that in broad daylight the burning of a building from which all the occupants could have quietly walked in a few minutes, should result in the loss of several lives—how many may never be known—is evidence of something wrong with the interior construction.

Sometimes the industry carried on in a building calls for the accumulation of considerable quantities of combustible material, but this was not the case to any extent in the instance noted; the trouble being that in this building, as in hundreds of others, the whole interior seems to have been constructed with special reference to rapid combustion.

It may be—probably is—difficult, if not practically impossible, to make the interior of a building fire proof, but it has been demonstrated, if it ever needed demonstration, that floors and partitions can be constructed so as to check the progress of a fire for a considerable time. It has even been proved, and is constantly being shown, that wood work can be rendered nearly incombustible, yet this knowledge seems to serve but little useful purpose so far as the security of human life is concerned. If more attention was paid, in ways that are well known, to rendering the spreading of a fire throughout the entire building not impossible, but a question of a little time, and less to the devising of fire escapes that are never used, it is probable that, in the event of a fire, people would walk quietly out of the building in an ordinary way.

With reference to fire escapes, the passage by the way of the stairs in common use is the most natural one, and, if properly constructed, this part of the building should be the last to yield to a fire instead of the first, as is too often the case. The location of the stairs is known to all in the building, and in a panic every one turns to them instinctively as a means of egress. At least this part of a structure, together with the halls and approaches, could be made so nearly fire proof, and so little dependent on the other parts for stability, as to provide a fire escape always in place, and in condition to be approached and used, at least as long as any part of the building was tenable.

The rendering of the loss of life in the instance of a fire in our high city buildings improbable, is not so much the matter of new inventions as the putting in practice of common-sense ideas well known. It resolves itself into a mere matter of dollars and cents, versus human life.—*American Machinist.*

Linseed Oils.

The linseed oils of the market are manufactured from linseed (*Linum usitissmum*), and are obtained by a cold or heated pressure of the seeds, and an oil of great purity results from the former, while the latter process gives a much larger production. The specific gravity of the commercial article is 0.9347, and it stands at the highest point of gravity of all the unctuous oils except that of castor oil, which is 0.9611. Fictitious oils are those which have been manipulated by experts, for greater revenue in its traffic, and is sold as *pure* boiled oil. The pure linseed oil is the best for painting and for the manufacture of varnishes. This oil, whether boiled or raw, unites with all pigments, and forms a smooth, compact mass, and when diluted spreads evenly and uniformly over all surfaces. There are more or less of the adulterated oils constantly on sale, and a few hints as to tests may be mentioned here. M. Heidenreich has found the application of a few drops of sulphuric acid, upon a glass plate on which a little of the suspected oil is placed, will detect its purity or show the colored fraud. A piece of crystal sheet glass laid over a sheet of white paper, then put a drop of the acid on ten drops of the oil to be tested; when whale or cod oil is present a peculiar centrifugal motion is seen, then a red color, increasing in intensity, and then afterwards becomes violet on the edges. When rape or turnip-seed oil, a greenish blue ring is gradually formed at a certain distance from the acid, and some yellowish brown bands proceed from the center. Of tallow or oleine, a brown color. Linseed oil has a brown magna, turning to a black. Oil of poppies and sweet almonds turns to a canary color, or yellow, passing to an opaque yellow. A common method of testing oils is to heat them sufficiently to odorize them, when the tell-tale senses are made aware of the double. The presence of fish oil in a vegetable oil is readily ascertained by agitation with a little chlorine gas, which blackens the fish oil, but has little or no effect on a seed oil. There is still another mode, and that is by its density. M. Laurot, a Parisian chemist, finds the use of his oleometer is a test for oils by measuring them when heated. The oleometer is put into a cylinder filled with oil, and this into another containing boiling water. The meter is graded so as to lower to zero in pure colza oil so heated, and he finds that it stops at 210 deg. in linseed oil, at 124 deg. in poppy seed oil, and at 83 deg. in fish oil, all having the same temperature; and any variation from the foregoing, changing the density of the oils, he can easily infer the amount of adulteration. The pure linseed oil from the crusher's tank is what is wanted by painters, as well as the public generally, and in some instances it is given; but no patent improvements can better it. It is a *fixed oil* by nature, and is in no need of further *fixing* by dealers to enhance their profits. The crushers of oil can sometimes improve the seed by properly cleansing it before sending it to press; and then after passing through that process to store it in large tanks of sufficient capacity to settle the oil, to free it from foots before it is drawn into casks for the market. This oil is naturally a siccative or drying oil, and never becomes rancid. To protect itself from exposure, a thin film hardens on the surface, and will keep good a long time; but eventually becomes fatty, when it may be used as a gilders' size. Linseed oil, when combined with pure white lead, in the form of paint, and applied to the sunny sides of a building, is one of the best combinations for whiteness and body known to painters. Its durability in such heated exposures is three or four years, when it becomes "chalky," and subsequently deteriorates rapidly from the action of the elements. The causes of decay in such mixtures is partly due to the carbonate of lead, and the constituent gases which compose the oil. Linseed oil is composed of carbon, hydrogen, and oxygen, and when applied as above, in thin coatings to exterior places, the oil in drying absorbs oxygen from the air, and the paint becomes hard and firm to the touch. But this tendency to imbibe oxygen is fatal to the solidity of the paint, though the oil becomes a solid. There is no evaporation, as in volatile oils; but instead, it takes from the atmosphere large volumes of oxygen, and by it disengages the carbon and hydrogen, leaving a disintegrated mass of lead, resin, and color in a state of impalpable powder. This is my theory of the chalking of white-lead paints as applied by the trade; and as beauty is only skin deep, we must submit to the chemistry which reveals it.

The tendency of seed oils to absorb oxygen accounts for the spontaneous combustion of various substances when besmeared with these oils. Linseed oil combines with more durable solidity with oxide of zinc and a large proportion of the sulphate of barytes, or some lead with the bulk composed of the carbonate of lime, or common whitening. There is less of opaqueness or body to paints of this class, and they do not work so freely under the brush, or give as bright tone to colors, as when pure lead is used. In drying, the zinc and barytes form a hard, solid surface; the oxygen is not so rapid in forming a part of it, and the oil retains the other component gases for a longer period, thus making the mixture a more durable covering as a paint for exposed outside work. The humid acids floating in the air do not attack the paints so readily; and for this reason they retain their brilliancy much longer than the carbonates of lead. There are many chemical paints, claiming to be a superior to pure white lead in covering qualities, are so successful in foisting their compounds on the market, by reference to their only redeeming feature, namely, durability.

J. E. W. C.

Mutual Antagonism in Woods.

It is interesting, and it may be instructive to some, to learn that certain kinds of wood, although of great durability in themselves, act upon each other in such a way as to produce mutual destruction. Experiments with cypress and walnut, and cypress and cedar, prove that they will rot each other while joined together, but on separation the rot will cease, and the timbers remain perfectly sound for a long period.—*Manufacturers' Gazette.*

Steel Square Problems.

A new work explaining the uses of the Steel Square. Sent post-paid to any address upon receipt of 50 cents.

The Chemistry and Potency of Sewer-Gas.

Dr. Letheby of London found, by analysis, that the elements of sewer-gas are sulphureted hydrogen, sulphide of ammonium, carbureted hydrogen, oxygen, nitrogen, and carbonic acid gas. It contains, also, organic matter. The constituents are not always the same, nor do they always exist in the same proportion. The noxious effects of the gas are due to the sulphureted hydrogen, sulphide of ammonium, and the organic matter. These are always found in sewer-gas, in varying quantities, and it is an important fact for every one to know that the two gases named are among the most dangerous known to chemistry, at least of those about which anything is popularly known. Even when greatly diluted, the first is deadly poisonous to man and animals. Air, otherwise pure, containing one part in two thousand of sulphureted hydrogen will instantly kill birds. Air one two-hundredth part of which is sulphureted hydrogen will kill dogs; and a mixture of one part in two hundred and fifty will end the life of a horse. Although it has never been practically tested, it is believed that air containing one per cent. of this dangerous gas will cause the immediate death of man. The danger which it brings to man's life, in the company of those other elements with which it forms sewer-gas, is apparent.

Advantage was taken of the destructive power of sulphureted hydrogen, some years ago, to rid the garden of the Luxembourg, in Paris, of the crows which infested it. These annoying birds had become so numerous that they were actually a terror, and were driving people from the garden. It was not safe to attempt to shoot them, since there was a possibility of doing injury to the people themselves. The device was adopted of placing in the hands of the gardeners a small bag containing sulphereted hydrogen, to which was attached a tube that could be thrust into the foliage of a tree, and into the midst of a flock of the birds, without disturbing them. The gas was then allowed to escape, when the crows immediately fell to the ground lifeless. The proceeding was so noiseless a one, that it was easily carried on till all were killed and the garden freed.

This extremely poisonous gas may be produced by acid-liquids turned into drains. It frequently seems to become concentrated, and causes death quite unexpectedly. Men have dropped dead while at work in the sewers of London, apparently from breathing it, and in some instances it has found its way into bedrooms through waste-pipes, not sufficiently diluted, and has caused instant death. If in a comparatively pure state, its effects are so exceedingly dangerous, in small quantities, it must, under other circumstances, be considered capable of doing much harm. Its known effects are, when present in air which is breathed, headache, vomiting, drowsiness, etc. This is observable in the rooms of the chemist, where, for experiment or otherwise, the noxious gas is generated. A simple trace of it in the air will often produce a debilitated condition resembling typhoid fever. In chemical analysis the operator and those around him suffer frequently from chronic poisoning of the blood by it; it is, also, the cause of typhoid or malarial fevers.

The effects of sulphide of ammonium on the system are similar to those of the first-named gas. A good many experiments have been made to determine the manner in which sulphureted hydrogen and sulphide of ammonium produce their noxious influence. The results have been interesting, and throw much light on sewer-gas poisoning. It is a well-known fact that the red corpuscles of the blood are its most important constituents. Their chief office is to take up oxygen in the lungs, and convey it to all parts of the body. The most important function of the body, probably, is the carrying power of these corpuscles. The body will do without food or drink for a number of days; but if this function is interfered with, even for a few minutes, death ensues. This is illustrated in suffocation by drowning or otherwise. No person is in a condition of health unless the red corpuscles perform their duty properly and efficiently. Chemical research has shown that the active principle of the red corpuscles is a very interesting compound, to which the name of hemoglobin has been given. In plainer terms, this compound is a portion of the substance of the red corpuscles, and upon this the oxygen-carrying power of the corpuscles depends. Hence, anything which interferes with this hemoglobin interferes with the oxygenation of the system.

Experiments on the blood of animals have shown that sulphureted hydrogen and sulphide of ammonium have a very destructive influence on the hemoglobin of the red corpuscles. Whenever they are brought into contact with these corpuscles each is robbed of its oxygen, and if the action continues the gases will utterly destroy the hemoglobin, and reduce the corpuscles to a condition which renders them worse than worthless. The hemoglobin is not only deprived of its oxygen-carrying power, but it is deadened, and becomes extraneous and *effete* matter in the blood. The result is apparent. The body cannot live for an instant without oxygen. It is the stimulus which supports vitality. Shut off the oxygen, and death follows at once; cut off a portion of the supply, and some derangement, even though not immediately fatal, must ensue. The condition of the blood of animals which have been poisoned by these gases shows the action to be that given above. The blood is black and thick, like the dead blood which has flowed from a wound.

From this destructive influence upon the red corpuscles, it may be easily understood what the nature of the danger is which persons who are exposed to sewer-gas must encounter, and how they may be injured by it. The peculiar, marked anemia, or blood-poisoning, of those who have suffered from sewer-gas poisoning, is explained by these facts. There still seems to be an influence in sewer-gas, derived from the organic constituents, which, also, not infrequently modifies the action of the other two gases. There is no doubt that the organic elements are as poisonous, or deleterious as the decaying particles of animal or vegetable matter wherever found, for that is all that they are.

In many diseases the poison of the malady seems to be eliminated largely by the bowels, and the fecal discharges evolve gases which are capable of propagating disease. This is particularly true of typhoid fever, and does not fail in the case of cholera, and possibly of cholera morbus, which is held by many to be cholera in an incipent stage, though there is reason to doubt it. Many leading scientists discredit the germ theory of the spread of disease. They believe that chemical gases generated by disease in one organism may produce a ferment, so to speak, in another, and the result is the reproduction of the same disease. It is known that strychnine produces a certain effect on the blood, as the woorara used by the South American Indians in poisoning their arrows does, and which results in death. There are no germs of disease in either case. There are no specific disease germs in the decomposing flesh of a corpse, and yet a few particles of the putrid flesh introduced by accident into the blood, as a student works in the dissecting-room, will poison the system, and may produce death. So the poisonous particles which are given off by a diseased person may float through the sewer, and on the wings of its gas be transmitted to the living and sleeping apartments of any family whose house has defective drainage, and when in contact with blood already deteriorated by sewer-gas, cause a ferment, or disease, in the system, the whole action being precisely analogous to that of yeast. Small-pox may be transmitted in this manner from the discharge of the pustules. Yellow fever may be propagated by fecal, vomital, and urinal discharges; but in this case it seems that the poison itself must come in direct contact with the person. The noxious gases of the sewer may be oxydized, and consequently destroyed. All that is necessary is to give them the benefit of plenty of pure air.

To summarize: The poisonous elements of sewer-gas are sulphureted hydrogen, sulphide of ammonium, and organic matter. The first is a deadly poison, and in a sufficient quantity its fatal effects are immediate. In small quantities it weakens the vitality of the system, by counteracting the oxygen-carrying power of the blood. It is always present in sewer-gas, and a very small amount will produce, or pave the way to, disease. The noxious gases which by fermentation reproduce the disease from which they originated, are borne hither and thither by sewer-gas through defective drains, and into houses in distant parts of a city.—*Sewer-Gas, and its Dangers.*

"The Murderous Sewers."

Such was the term recently used by a city contemporary, in referring to the sewerages in San Francisco. But sewers are murderous only so far as the *agencies* of death exist in them. They neither "lie in wait" nor seek the opportunity to destroy human life, but perpetuate their operations according to organic laws and conditions; and the murderous aspect of the case lies with those who employ, and those who execute the wretched work so often done by *miserable incompetents*, who understand no more of sanitary and sewer sciences than an untamed ape would be able to comprehend the philosophies of the ancients.

Murderous they are, so far as they are made the instruments of death to TENS OF THOUSANDS; but the responsibilities in issue rest not upon the sewers, but upon the *soulless many* who assume to understand, and are employed by owners to do the sewer work of buildings. Any human being possessed of two hands, with the physical power to use them, can dig a sewer trench and place pipe in it, to *look like* a system of sewerage; but this is the least material feature of the case, and requires no more than physical effort. But beyond this there is something which demands intelligence and mechanical skill, combined with a proper knowledge and appreciation of the principles and necessities involved.

If our contemporary had made his application to "murderous" *sewer layers*, it would have been more nearly correct; for it is feasable in argument, that the man who inserts sewers connecting with buildings in which people live or labor, in which there is a single imperfect joint, or any possibility for the escape of sewer gases, is *in effect* a murderer. For whether a man, woman, or child is deprived of life through the agencies of deadly drugs, the pistol, knife, or *badly constructed sewers*, the effect is the same upon the death-stricken individual; and the fact is too well established to admit of question, that sewer gases are deadly in their effects, and that multitudes have found early and untimely repose in death by being compelled to breathe atmosphere impregnated with sewer gas.

The strangest feature of the case is, that with all the well-known facts, so little practical interest is taken in the matter. The subject is talked over and discussed in print, but beyond the personal interest sometimes put in practice by individuals, the evil is increasing with the extending and multiplication of sewers, as nine-tenths of the sewer work done in this city is faulty and imperfect.

Shortness of Life Among Architects.

It is only a short time ago, remarks the *Saturday Review*, that any one conversant with the artistic politics of the day would, if asked to name the architects who had in the course of the competitions, official or unofficial, which were at that time in higher favor than they have since become, taken the foremost position as competitors, if not as combatants, have undoubtedly put in the front line Digby Wyatt, Scott, Edward Barry, Burges, Street, to name them in their order of departure. Now all of these are dead—Scott only, just an old man, and the rest in middle age. Every one of the men, in fact, over whom any real battle at that time raged has, with the exception of Mr. Waterhouse, left the scene. The *Times* attempted to sketch, with a keener eye to faults than merits, the difference between the old and the new taste in architecture by pairing off Mr. Street with Mr. Decimus Burton, who had died a few days before, aged eighty-one. The comparison might have been more telling if it had included a third architect, who died on the very day before Mr. Street, and who was, although a year older than Mr. Burton, rather the first of the new than the last of the old school. More than forty years ago, when prominent men of the Gothic school who have since been famous and died were still unheard of, Anthony Salvin seemed destined to lead the revived school of mediæval art. But he was rather torpid in the important matter of ecclesiastical architecture, and so, while making proof of his mastery of castellated construction at the Tower, at Windsor, at Alnwick, and in his own modern castle of Peckforton, as well as of considerable taste in country houses, he practically became an outsider in the animated conflict of styles which has filled up the intermediate years.

There is never an effect without some cause, and it is better to seek what explanation can be given for the remarkable shortness of life among conspicuous architects, than idly to lament the losses. No doubt, as the phrase goes, it is the pace which kills; but there is something more than the mere speed to account for the dangers and the casualties of the architectural race. The nature of the broken country which has to be crossed tells against safety as much as the mere speed. Some men kill themselves by over-devotion to an art, and others by an over-devotion to a profession; but it is the hard and peculiar fate of an architect to be following both an art and a profession. His education in composition matches with that of a painter in painting. His education in construction matches with that of an engineer in engineering. Once he is in practice, the thought needful to marry beauty with utility in his designs is only the beginning of troubles. He has to settle his accounts with employers, who may be stingy and overreaching, exacting and capricious, ignorant and prejudiced, vain and half instructed; with contractors too often incompetent, dishonest, or insolvent; with workmen too stupid to understand and too obstinate to obey. Add to this the wear and tear of railways, the severities of weather, and it will be seen that the career of a successful architect is one which tells with unusual severity on the human frame. Yet there is no remedy which could be thought of which would not be worse than the disease. To separate the profession of artistic and of constructive architect would be to extend and perpetuate a system which has already, in the hands of speculative builders, worked so much woful mischief to the national taste.—*British Architect.*

Steel Square Problems.

A new work expaining the uses of the Steel Square. Sent post-paid to any address upon recript of 50 cents.

What Next?—Evolutions in Styles of Architecture.

Public taste in matters architectural, both as regards the erection of buildings, their exterior delineations and decorations, and the interior finishes, appointments, and furniture, have of late years become matters of constant change. To meet the wants of the present generation, it is necessary that architects should be as versatile in their conceptions as the artist whose perpetual thinking is to find some new idea, some hitherto untouched or newly embellished subject, differing from, if not surpassing, those which have preceded. In former periods, the classic orders were, to a certain extent, revered for their grandeur and semi-sacredness, and those who dared to innovate did so with cautious hand, seeking to invest the new with grandeurs and beauties co-equal with the old.

But as time rolled on, a spirit of recklessness and disregard for former things largely controlled; and while many beautiful results followed, thousands of architectural abnormities have also from time to time appeared, sometimes gaining a temporary prominence, but soon passing away among the host of other unmeritorious and no longer accepted conceptions.

In harmony with this, an exchange says: "The Eastlake is no longer popular (in the Eastern States). The so-called Queen Anne style is said to be dead and laid upon the shelf. What is to follow is a matter of some concern to those who cater to fashion." (The term *fashion* is well applied, for a considerable portion of that which is passed off as architecture is a mere *fashion*—a whim, a caprice of the imagination without *order* or *style*.—Ed.) "The public is capricious and will always be swayed by fashion. Fashion has decreed a change in household furnishings. What is it going to be?"

Another exchange adds: "That the present direction of public taste is plainly toward the French art. The public has tired of the straight lines, the sharp angles, and the formal decorations derived from English models, and is turning again to the more graceful, if less serviceable, productions of the French. The change so far is manifested principally in ornamental details. The strong lines, and solid, serviceable, construction, which have come to us from England, are retained; but they are refined, and, to many tastes, rendered more pleasing by the graceful and flowing ornamental lines of which the French make such frequent use. * * * The general tendency is in the direction of catholicity, and more pleasing variety than has heretofore prevailed, rather than toward the adoption of any one school, to the exclusion of all others."

The *Deutsche Bauzeitung* of December 14th contains a plan and section of the ill-fated Ring-Theater in Vienna, together with a very intelligent description of the fire which destroyed it. The walls of the building were unusually thick, particularly the one separating the stage from the auditorium, and other precautions were taken in the construction to avoid danger from fire. The roof was of iron, and an ample system of water-pipes was provided, arranged especially with reference to a possible conflagration on the stage, and a wire-gauze curtain hung behind the proscenium arch. The gas-lights were carefully arranged, and due watchfulness insisted upon; and, as the *Bauzeitung* says, the danger of fire was no greater than in a hundred other theaters. The real fault of the building—one which cost nearly a thousand lives—was in the planning of the staircases and entrances. Although five flights of stairs led from the upper portion of the auditorium to the ground floor, and one more led to the royal box, and two served the stage end of the theater, every one of them had the fatal fault of being inclosed in a room by itself, opening only by a door into the vestibules or passages. One side of the building adjoined the neighboring houses, but the other side and the front and rear bordered on open streets. Unfortunately, it had been found desirable to give the portion facing the principal side street to restaurants, so that there was no public entrance to the theater except in the middle of the front. Of the two gallery staircases, which were inclosed by other rooms on the lower floor, one was accessible only by a tunnel under the parquet floor, and the other opened into a crooked passageway leading to the front entrance. The grand staircases themselves, situated on either side of the main vestibule, were not only awkwardly winding, but reversed in direction, so that the persons descending them were directed against the wall which inclosed the auditorium, at a distance of only a few feet, and in such a manner as to meet face to face the crowd from the parquet pouring out of a door in the same wall. The two streams mingling were obliged to turn at a right angle to reach the main vestibule, which they again entered face to face with the multitude descending the stairs on the other side, and a second turn was necessary to direct them toward the entrance doors. According to the information gathered by the *Bauzeitung*, the fire began by the accidental wafting of a "border," painted on jute canvas, into the gas-lights close by. A moment later the curtain caught, and was drawn blazing by the current of air into the auditorium, kindling the papier-mâché decorations in all directions. Apparently no effort whatever was made to put in operation the various protective devices which existed. A turn of the hand would have thrown streams of water in every direction over the building, but the valve was left untouched; the wire curtain might have been dropped in a few seconds, but it was neglected; the doors of special exit, which would have saved multitudes, were not unlocked; the oil-lamps provided to illuminate the passages in case of failure of other means were not lighted, and the gas being turned off at the first alarm by an unreflecting official, the terror-stricken fugitives were left to grope their way in darkness through passages which were notoriously difficult to follow, even in clear light.—*American Architect.*

Among the many fillers in use for porous hard wood, this is recommended as one of the best: Stir boiled oil and corn starch into a very thick paste, add a little japan, and reduce with turpentine, but add no color for light ash. For dark ash and chestnut use a little raw sienna; for walnut, burnt umber and a slight amount of Venetian red; for bay wood, burnt sienna. In no case use more color than is required to overcome the white appearance of the starch, unless it is wished to stain the wood. The filler is worked with brush and rags, in the usual manner. Let it dry forty-eight hours, or until it is in condition to rub down with No. 0 sand-paper, without much gumming up, and if an extra fine finish is desired, fill again with the same materials, using less oil, but more of japan and turpentine.—*American Inventor.*

A story is told of a farmer who built a stone wall four feet high and six feet thick, so that when it should fall over it would be higher than before. We don't suppose that our friends, Munn & Co., publishers of the *Scientific American*, contemplated any sudden upsetting in their old offices in the "World" building, 37 Park Row, but certain it is that being burned out completely and hastily about noon January 31st, before night they were installed in more desirable offices in a much better building at 261 Broadway, with new furniture and fixtures. Their books and papers were preserved, and the *Scientific American* and the *Scientific American Supplement*, and their extensive patent business, go right along, as if nothing unusual had happened.

Competitive Designs.—No. 7.

In the consideration of any subject involving diversified and conflicting interests, there must naturally be disagreements as to conclusions set up by the respective interests; particularly so at the present, when each individual presumes competency in his own judgment to decide all questions submitted. This is all right and proper when judgment is called in exercise upon matters of familiar import, in connection with which daily contact and experiences have trained and qualified the mind to grasp and understand correctly the underlying principles involved in the matter upon which judgment is to be passed. But men may, and often do, gather up false ideas, and theorize themselves into beliefs from superficial understandings, which may be, and often are, egregiously erroneous, and greatly at variance with the essential facts involved; and when by force or privilege of circumstance it becomes possible to vitalize such errors, and by any means improve them upon others, a wrong is inevitable. It is a well-known fact that men of great learning and culture often form absurd and unsustainable conclusions in reference to matters not within the *direct compass* of their special lines of thought and experiences. The human mind is not so constructed as to be able to comprehend and understand in detail every principle of right. A heresy or fashion may be theorized into a fact or virtue from certain standpoints, which, when assailed and scrutinized by the light of truth, betrays the uncertainty of human yearnings, and the possibility of mistakes; consequently it can but occasionally happen that the basis of competitions are correct. Those who handle them seldom enjoy better than a vague idea of the involvements; and this imperfect knowledge renders exact fairness next to impossible. And if the parties controlling happen to be of that class which invariably survey facts and reach conclusions from a selfish standpoint, injustice is an assured certainty.

It is all very well for committees and commissioners to meet and determine upon propositions, and submit them with restrictions for the acceptance of others; but neither the submittal on the one hand, nor acceptance on the other, removes or modifies the inherent injustice. And it is fair to claim that men who set up or dictate that which is *in itself unfair and unjust*, whether through design or ignorance, are not entitled to the credit of rightful action. To render a proposition or act fair and just, all interests must be considered, and a correct balance of equitable rights conceded to all parties; and every encroachmont upon this rule becomes a positive wrong.

Those who claim for themselves integrity of purposes very naturally and constantly, from their standpoint, repudiate all imputations of designed injustice; but all lines and measures of right, drawn or set up upon error, are false and unsound. Exact justice is that code of moral and business reasoning, determination, and action which accords as much as it claims; and those who ask or practice more or less than this depart from the lines and rules of right. But in the matter of competitions, this theory is but seldom practiced; the prevailing disposition being to gain large advantage with as little cost as possible to those seeking them, and but limited consideration for those whose services are sought to be obtained. And this condition of things being well understood by architects, it has invoked the practice of means and measures which should never be known with favor in an honorable profession, one which gives to artful and calculating men decided advantages over those who are too honest or modest to attempt the advancement of their personal interest by any means not strictly honorable and unimpeachable. Competitions naturally incite a species of direct humbuggery, and not a few of the successful resort to this as a means of winning success. "Commissions" and "committees," by inviting general or even restricted competitions, create the necessity for all the deception that can be worked in, even by those who produce meritorious designs. For the man who presumes that the superiority of his drawings will outweigh the personal influences which surround forty-five fiftieths of the competition cases, simply accepts a delusion as a fact. If not more than three or five were permitted to engage in any competition, and each and all of them receive fair pay for the services rendered, the evil would be only measurably modified, but not wholly remedied. For even then, in nine out of ten cases, the sharpest manipulator of influences, with remarkable merit in his plans, would secure the first award.

The line of argument presented may lead some of our readers to conclude that architects must be a peculiar, if not an untrustworthy, set of men. But this does not follow. It may be safely claimed that, as a class, they are as pure as any like number of men in any profession, and the questionable things stated come not from personal or professional baseness, but from the necessities which grow out of the nature of things known to surround competitions generally. In the preparation of a set of drawings for competitions much labor and expense becomes necessary, and those who engage in the work know full well that unless the plans made by them receive one of the awards offered, all the time, labor, and coin expended must be to them a entire loss. And but few men live who would not use every possible means available to avoid such a result; and but few men could be found so pure and generous as to permit defeat, when by a little "wire-pulling," or other not flagrantly improper means, they could secure decision in their favor.

But in addition to the financial issues involved, there is the other, and to many greater, consideration of ambition and reputations—considerations which are calculated to inspire every energy of the mind and physical nature to the utmost extent. Defeat in anything attempted is painful, with increased mortification when brought about by comparisons. And ambitious men, rather than tamely submit to defeat, would suffer and endure anything within the bounds of reason. When subjected to such tests, the pressure becomes severe, and that which under other circumstances might be recognized as wrong and unfair assumes a virtue when such assumption may be used to advantage. This rule prevails in all relationships, and neither senators, legislators, governors, ministers, judges, lawyers, nor the "purest business men" are free from the reflection of wrong acts and decisions through force of pressures brought to bear upon them. And when a full and perfect understanding of the whole subject, considered in all of its bearings, is not possessed, the liability to err becomes greater. But we are met with the statement, that those who prepare and present plans in competition simply submit *samples* of their work, subject to the contingencies surrounding the submittal. But the *sample* idea is another strained and unfair proposition. Plans made by special direction, to fit a certain lot, and for certain defined uses and purposes, are special and not sample in character. Samples of goods, wares, and merchandise are legitimate submittals in contests for trade, because whether accepted or rejected they retain their market and merchantable value, and the merchant loses nothing but the opportunity to reap the profits of success as a bidder. But not so with competitive plans. Being made for a specific purpose, they possess no value outside of that purpose, and their author must lose, not only the opportunities of after profits in the way of commissions, etc., but his whole stock in trade, as far as his plans are concerned, become an absolute and entire loss, having no value whatever. And as before stated, this hard fact provokes a vast amount of wrong-doing, and "committees" and "commissions" are often "played" by shrewd competitors, in their skillful efforts to avoid such absolute loss, for which there is no relief or remedy in the event of a rejection.

American vs. French Landlords.

A daily paper expresses great delight over a heavy jury verdict against a property owner whose area being open caused serious damage to a careless passer-by. This is one of the perils of householding which property owners in this country must face, and which tends to keep up rents. A careless servant fails to properly cover the coal-hole, and the man or woman who is injured thereby gets heavy damages from the innocent owner of the house. Juries in America look upon railroad companies and landlords as enemies of the human race, and always punish them severely when they get a chance for owning houses and accommodating the public on transportation lines. People here who rent furnished houses must charge a high rent, for there is no recompense for furniture ill-used or destroyed. The petty courts afford no protection to the property of the owners of the apartments or the furniture. In regard to such matters as these, Paris is very different from New York. The traveler finds, to his astonishment, that in France the law favors the owner of property. They are not liable for damages when an accident occurs to a passer-by. In the eye of the French law it is the police who are to blame if coal-holes are left open and areas unguarded. Then careless and wasteful Americans, who rent suites of rooms furnished, are very much astonished when they leave their apartments to find that they are responsible for the damage done to the furniture. Every sou is charged up against them. If the carpets are permanently ruined, or the furniture broken, or the walls scratched, the tenants who were privy to the mischief have to pay roundly for their carelessness. We all know how different it is in New York. Here the tenant is tempted in every way to be careless, for the landlord knows that the court is not his friend but his enemy, and that there is no redress for the destruction of his property. Any drunkard here can bring an action for damages if he slips and is injured in front of a house. The only remedy the householder has is to get all he can for his property in the way of rent, and insure himself against all possible losses. Certainly eleven out of every twelve jurors belong to the house-renting class, and cannot be depended upon to do justice to the owners of the property to which they pay tribute. If we want rentals to assimilate to those of Paris and London, we must treat property holders with more justice.—*N. Y. Real Estate Record.*

A Good Point.

Considering the haste prevailing in building operations at the present day, and the granting of the certificates for new houses immediately upon their completion—a certificate, by the bye, rarely refused, and even then in a most ineffectual manner—we may fearlessly express it as our opinion, that if a proper examination of the degree of dryness of walls, and the rooms which they inclose, were made, nearly every new dwelling, as it is now handed over to the public for habitation, is injurious to health. Why, houses are begun in the spring, and receive their tenants in August! And this is not only the case with private dwellings: even in the case of municipal buildings—schools, for instance, where the greatest care ought to be exercised—the same practice very frequently prevails. No one will affirm that such buildings could be sufficiently dry under such circumstances, unless it is his intention to deceive himself.

Market Reports.

LUMBER.—Fair demand, steady supply, prices firm, is all we can chronicle.

Receipts since January 1st, 1882:

Lumber	28,098,050
Shingles	6,185,500
Laths	3,673,000

A correct price list of lumber will be found below:

Pine.

PAINTS.—A new company has made its appearance, introducing the OMAHA WHITE LEAD. With the large demand that is confidently expected this year, the agents should be able to control a fair amount of patronage.

The PIONEER brand has been successfully introduced into every town and hamlet on the Pacific coast, and has given universal satisfaction. We quote price at 8¾ cts. per lb.

ATTENTION, DRAUGHTSMEN!

Our New Heading!

All designs for the New Heading of this journal are to be given to the Secretary of the Pacific Coast Association of Architects, Room 11, 240 Montgomery Street, on or before Friday, the 7th day of April, 1882.

Any information cheerfully given, with a sample copy of the journal, to those competing for the design.

Building Intelligence.

There is but little to report this month. The letters received from our numerous correspondents give assurance that many buildings will be erected in the different counties. We are still of the opinion that labor will be both scarce and high. Even now the ranks of the unemployed have become exceedingly thin. The demand for skilled labor in several of the different trades is fully equal to the supply.

To those contemplating building, we would say that *now* is the time to carry out their projects, as, judging from the number of plans that are being prepared in the different architects' offices, we can say, almost to a certainty, that everything in the building line will not be less in value than at present, with chances decidedly in favor of prices advancing.

Should the new Odd Fellows' Hall be built this year, and the buildings be erected in its vicinity that are talked of consequent upon its erection, masons and carpenters will be in such demand that wages will be up to a higher price than has ruled for many years.

SAN FRANCISCO.

Two-story and attic frame dwelling with brick basement on corner of Post and Gough streets. Owner, Jacob Levi, Sr.; architects, Wolfe & Son; contractor, Moore Bros.; brick work, Byron Bros.; total cost, about $18,000.

One-story brick building with basement on Beale street, between Market and Mission. Owner, W. W. Montague & Co.; contractors (brick work) W. E. Stevens, (carpenter work) Chas. Kinsman; cost, $8,000.

Repairs and alterations to house on Sutter street, between Laguna and Buchanan. Owner, L. Getz; architect, W. Mooser; contractor, Sanchez; cost, $3,000.

Two-story double tenement house on Hyde street near McAllister. Owner, Etienne Taniere; architect, W. Mooser; contractor, Laherty; cost, $8,000.

Three-story frame building on Sixteenth street, between Folsom and Harrison. Owner, A. Morgenthau; contractor, A. G. Fitzpatrick; cost, about $12,000.

One-story frame building on Clay street, near Baker. Owner, Jas. Brannan; architect, H. T. Bestor; contractor, W. H. Wharff; cost, $1,200.

One-story frame building on corner of Howard and Spear. Owner, Wigmore; contractor, Brotherton; cost, $2,800.

Two two-story frame buildings on corner of Pine and Octavia. Owner, White; architects, Schmidt & Havens; contractor, J. Furness; cost, ——.

One-story and basement frame dwelling on Treat Avenue, near Twenty-fourth.

Two-story and basement frame dwelling on Sutter street, between Franklin and Gough. Owner, Mrs. M. P. Payne; architects, Curlett & Eisen; contractor, Creighton; cost, $16,500.

Two-story frame dwelling on Octavia, between California and Sacramento. Owner, J. G. Severance; architect, Chas. Geddes; contractors, Powell and Cogswell; cost, ——.

One-story frame dwelling on California street, between Broderick and Devisadero. Owner, Adolph Rapp; architect, H. Geilfuss; contractor, Sylvester Grant; cost, $2,150.

Two-story frame dwelling on Pine street, between Buchanan and Webster. Owner, H. Hinkle; cost, about $5,000.

Three-story frame building on Fourth street, between Harrison and Bryant. Owner, C. E. Boman; cost, $3,000.

Additions and alterations to a three-story building on corner of Mission and Mary. Owner, Donahue; contractor, Smith.

Additions and alterations to old church building on corner of Mission and Mary. Owner, C. Wunchie; architect, Schroepfer; contractor, Plums.

Two-story frame building on Seventh street, between Mission and Howard. Owner, Wm. Pullen.

One-story frame building on Tenth street, between Mission and Howard. Owner, G. Hertel; contractor, F. Reinicke; cost, $2,100.

Two-story frame building on corner of Third and Brannan. Owner, E. B. Pierce; architect, Curtis; contractor, G. B. Green; cost, $2,500.

A two-story frame building at foot of Powell street, for the United States. Contractor, Wilcox.

One-story frame building on corner of Montgomery Avenue and Vallejo.

One-story frame building on Valencia, near Twenty-third. Owner, Houston; Contractor, Ferguson.

Frame buildings on corner of McAllister and Buchanan. Owner, L. Junker; contractor, Jerry O'Brien.

SACRAMENTO.

Two-story frame dwelling on corner of Twelfth and M streets. Owner, L. B. Mohr; architects, Babson and Seadler; contractors, Carle & Croly; cost, $8,000.

WOODLAND.

Three-story frame building with brick basement on Lincoln Avenue. Owner, Samuel Hogan; architect, Frank Deestine; contractor, Stephen Blue; cost, $18,000.

FRESNO.

One-story frame building. Owner, J. Donahue; contractor, J. Lee; cost, $1,000.

One-story frame dwelling. Owner, J. M. Brady; contractor, M. R. Madera.

One-story frame dwelling. Owner, Rosseau; contractor, J. Welsh.

One-story frame dwelling. Owner, La Mott; contractor, C. Spano.

SAN JOSE.

Two-story frame dwelling on Lincoln Avenue. Owner, S. Newhall; architect, J. O. McKee; contractor, Jacob Lenzen; cost, $3,800.

RIVERSIDE.

Additions to the Glenwood cottages. Owner, F. A. Miller; contractors, Woodward & Brown; cost, $10,212.

Building for the M. E. Church. Carpenter work, Battles, Fales, and Pulz; masons, Downs and Sheldon; cost, 5,000.

BIGGS.

One-story frame building. Owner, F. F. Carnduff; contractor, J. W. Myers.

On railroad land south of Biggs, frame building for powder-house. Owner, Farmers and Mechanics' Store; contractor, J. N. Myers.

ALAMEDA.

Two-story residence on Railroad Avenue, west of Webster. Owner, A. Hoffman.

One-story cottage on Central Avenue, near Webster. Owner, Mrs. E. Boyd.

New Style of Building.

Several novel features in building have just been introduced in an eight-story business house being erected in New York by Mr. Vernon K. Stevenson. The tide of opinion in the fire department and among insurance companies having lately turned against iron beams, the owner has placed on his floors thick wooden beams one foot from center to center, and filled the interstices with cement, thus forming a solid floor two feet in thickness, which he claims will resist the penetration of fire for several days; whereas, he says, "the iron beams would bend with the heat and fall out, and the building cave in." The stairs are of slate; the walls three feet in thickness. The whole of the building is finished in cherry and California redwood, which has very much the appearance of mahogany. This attempt to utilize native instead of foreign wood seems to have succeeded very well.—*The Tradesman.*

Publication Notices.

All books noticed in these columns can be had at publishers prices at this office.

The Mechanic's SLIDE RULE, *and How to Use It*, by Fred. T. Hodgson, contains a number of valuable rules for its use, measurements of timbers, etc. Price 25 cents.

LAKEY'S VILLAGE AND COUNTRY HOUSES, containing one hundred pages of designs, is one of the best of its kind published. The illustrations are neatly executed, and of practical modern design; and many of them suitable for adoption on the Pacific coast. We heartly recommend it as worthy a place in every gentleman's library who enjoys a taste for architectural matters, as well as to all architects and builders. Price, $5.00.

THE ART AND SCIENCE OF CARPENTRY MADE EASY, by William E. Bell, *revised and enlarged edition*, published in 1881, is a book of great merit, and should be read and studied by every carpenter. Too many of our working-men are content with "knowing enough for all practical purposes," overlooking the great fact, that by reading and studying instructive books much more of valuable information may be obtained, which would so far simplify the daily manipulations of material as to remove or render easy of comprehension, the difficult problems which sometimes arise, adding perplexities to the toils of the day. Price $5.00.

"*Practical Lessons in Architectural Drawings*, by William B. Tuthill, A. M., Architect, published by Comstock, N. Y., is one of the most practical and useful books of its kind that we have noticed. It contains 33 full-page plates of illustrations (one in colors), and 33 wood-cuts, showing methods of construction and representation."

"*This book was suggested by the frequent call for a work of a restricted technical character, one which would give to the student who already has some knowledge of geometrical drawings, the information necessary to properly prepare his work for the mechanic.*"

It may also be read with advantage by many *practicing* architects, who judged by their delineations in construction, have as yet learned but little correctly. Copies can be had at this office, at publisher's prices. $2.50.

"*Sewer-Gas and its Dangers*," by George Preston Brown, is one of the best practical books on the subject published. Every plumber, architect, and owner should have a copy. It treates the subject handled vigogously and practically. Price $1.25.

We have received new invoices of "The Art of Saw Filing," by Holly, and the "Workshop Companion," both valuable and instructive little works, copies of each of which should be in the hands of every mechanic. Prices $1, and 25, respectively.

Copies of all the works from time to time noticed in this journal may be had at this office at publisher's prices. When stamps are remitted for books or subscriptions to this journal, our friends will oblige by sending the two-cent denomination, or one-cent and three-cent if the two-cent are not obtainable. The larger denominations are inconvenient.

Palliser, Palliser & Co.'s Useful Details.—Since their introduction in our catalogue of useful publications, the sales have been large. We have a full supply on hand. Sold at publisher's price, $3.00 each set, 20x26 inches, with 40 pages of detail drawings.

A supply of all books mentioned in our catalogue constantly on hand.

The Carpenters' Manual, by John D. Edwards. A very useful little book, containing a large range of practical ideas in connection with mechanical studies. Carpenters and builders will find it of much more value than its cost—50 cents.

The California Architect and Building News.

BACK NUMBERS OF THIS JOURNAL.

Since we commenced our series of articles on the HISTORY, DESCRIPTION, AND USES OF THE STEEL SQUARE, we have had an unusual demand for back numbers containing said articles. We regret to say that we have on hand but a

☞ FEW NUMBERS ☜

of each month, counting from last September, and would advise those who want a complete series of this journal to send AT ONCE for any copies necessary to make their set complete.

BOUND VOLUMES.

Bound Volumes of 1881 are now ready for delivery. Sent postpaid to any part of the United States upon receipt of $2.50.

A limited number of Bound Volumes of 1880 on hand, to be had at the same price.

Our New Heading.

In our May number, we will have the pleasure of placing before our readers and the public generally our new heading, lately adopted by the Pacific Coast Association of Architects as one worthy of being presented to the architects and draughtsmen of the East as a sample of talent of their California brethren on this coast. We will also present the design taking the second premium.

Advertisers would do well to secure space early, as most of our room is now taken. Space on the covers outside cannot be had at any price, and as the inside room is very limited, an early application is absolutely necessary.

We recognize in our recovery the tender mercies of an all-wise Providence, who spares and and smites as to him seemeth good, and none may say, Why doest thou? Although our naturally strong and robust constitution might be interposed in plea of recovery, yet neither that nor the strength of vigorous manhood can stay service and execution when the summons is issued calling us from the pursuits of life to the realities which lie beyond the limits of time.

This is fully illustrated in our case; for while we over whose head has rolled more than sixty-one years have been restored to health, another loved one, under the same roof with us, in early manhood, strong and robust in an eminent degreee, from like diseases in part with our own sank away into the arms of death within a few short days, while we were permitted to tarry yet a little longer amidst the scenes of time; and we trust for purposes of good to all who may in any manner come within our influence, either in domestic and social life, in our editorial capacity, and in all business relationships.

Only a few constitutions, however, humanly considered, could have passed through the same ordeal, beginning with pneumonia of very bad type, which was followed within five days with a severe attack of erysipelas in the face and head, and these accompanied by pile troubles of the worst kind.

The management of this journal and its contents for the month of March, and also the present month, has been in the hands of our junior partner; and while we feel pleased at his success, we trust that our patrons have found no fair cause of complaint. We have heard none, and if we may judge from the rapid increase of subscribers during the past thirty days, we may conclude that more than usual satisfaction was given.

From Mr. Charles L. Eastlake.

The following letter from Mr. Eastlake would have appeared in an earlier issue, but for causes already understood by the readers of this journal.

In our issue of October, 1881, we gave expression to our views and opinions in reference to the so-called, misnamed, and much-abused "Eastlake style" of architecture. The article referred to has met with universal approval, and has been copied into scores of technical journals, and many of daily issue in this and other sections of the country.

While some neat and in themselves consistent examples of house construction are to be found under the denomination of "Eastlake," so called because "Eastlake," as a name, has the ring of poetry and romance in it, and serves well in beguiling that class of owners who are ever seeking novelties and peculiar ideas and notions, often accepting monstrous violations as "beautiful," and special features which may be and often are infamous perversions of good taste and correct judgment, architecturally considered, as architecture.

Being satisfied in our own minds that Mr. Eastlake's name was being improperly used throughout the United States, and particularly so in California, by its being applied to any fanciful and by no other name explainable style of houses, we addressed a letter to that gentleman, and received the following reply:

LONDON,
41 Leinster Square, Bayswater, W.,
26th January, 1882.

Sir—I beg to thank you for your letter of the 19th ult., enclosing an extract from the CALIFORNIA ARCHITECT AND BUILDING REVIEW, in which reference is made to my books, and to a style of architectural design in America which I am erroneously supposed to have originated.

As you are good enough to ask for my views on the subject, I can assure you that they entirely accord with the opinion expressed by the writer of the article in question.

For some years past, it has been my fate to see illustrations and hear of objects manufactured in America under the name of "Eastlake furniture," which I not only never designed, but which represent a taste very far removed from, and often directly opposed to, the principles of art-workmanship I have endeavored to advocate.

That I cannot be held responsible for these inventions, may be inferred from the fact that not a single American manufacturer producing such articles as I have mentioned has thought it worth while to consult me on the subject.

I now find, to my amazement, that there exists on the other side of the Atlantic an "Eastlake style" of architecture, which, judging from the specimens I have seen illustrated, may be said to burlesque such doctrines of art as I have ventured to maintain by criticism of modern works, or deduce from the study of ancient examples.

I feel greatly flattered by the popularity which my books have attained in America, but I regret that their author's name should be associated there with a phase of taste in architecture and industrial art with which I can have no real sympathy, and which by all accounts seems to be extravagant and *bizarre*. I am, sir,

Your obedient servant,
CHARLES L. EASTLAKE.

There is a hardship in this state of facts for which, however, there can be no relief to Mr. Eastlake, since the world is full of men ready to *use* and *abuse* whatever may fall in their way, whether it be the reputation, personal rights, or property of others, so that money can be made by so doing. But it is not likely that this—in fact, *no style* of architecture will be of more than exceptional occurrence upon this coast, as the immoderation and extravagance practiced by those who have sought to force the "style" into more general use have simply served to restrict and restrain public appreciation, and hasten the time when the excessively *Eastlakish*—by which we mean those fantastic conceptions which in construction can only stand as nondescripts, unrecognized by any term or title within the range of architectural authorities, and disowned by the gentleman whose name is misused—shall stand as examples of the freaks of folly which at times may exist, even in the practice of architecture.

A Southern States paper gives some facts which show that those who prate continually about the imminent exhaustion of forests leave a most important forest country out of account. The States of Tennessee, Alabama, Arkansas, Florida, Georgia, South Carolina, and West Virginia contain, in the order named, from 58 to 66 per cent. of forest land whereas Maine and Michigan, which now produce one-half of the lumber used, contain only 47 and 40 per cent. of forest land. North Carolina, Louisiana, and Mississippi have an even greater extent of forest land, still untouched, than the States just named. Neither is the world generally aware of the good quality of the timber in the South. All the trouble is that, owing to the absence of snow, the wood is not won so cheaply as in the North.

Pacific Coast Association of Architects.

The regular monthly meeting of the Pacific Coast Association of Architects was held in the rooms of the Art Association, on Friday eve, April 7th. President Laver presiding.

Owing to the absence of the secretary through illness, his place was ably filled by J. B. Whittemore.

A proposition for membership was received and referred to a special committee, owing to the absence of the regular investigating committee.

Theo. A. Eisen, Esq., then delivered an able speech, which is printed in full in another part of this issue. It was well received by the members of the association, who vied with each other in favorable comments upon the subject-matter and views as presented by the speaker.

A motion was made and carried that the committee on the new heading for the CALIFORNIA ARCHITECT AND BUILDING NEWS reconsider their report as presented to this association in January, so that, if deemed advisable, premiums will be awarded to the best two designs.

*(It will be remembered that the association offered two prizes of $25 and $15 for the best two designs for a new heading of this journal. At the December meeting, 1881, seven designs were presented. Nearly all of them had one serious fault—*WANT OF ORIGINALITY. *One of them being almost a counterpart of an Eastern journal as regards the shape of the letters and the flourishes between them. As the intention of all parties concerned was to have something different from any journal printed, it was deemed advisable to raise the premium, and call for new designs. This action did not meet with the approval of many who felt interested. The above resolution is simply placing the matter in the hands of the committee for the purpose of reconsidering their report, so that the two premiums offered at the time referred to may be awarded if the committee so decide.—Ed.)*

A recess of five minutes was then taken for the purpose of examining the new designs for the heading of the CALIFORNIA ARCHITECT AND BUILDING NEWS. Designs were submitted by the following parties: A. T. Matthews, Oliver Everett, Wm. Schrof, and Vesta Schallenberger. The designs were referred to the same committee that reported upon those received last December; viz., Messrs. Sanders, Curlett, and Curtis.

Motion made and carried that a special meeting of this association be called on Friday evening, April 15th, to consider the subject of forming this association into a Chapter of the American Institute of Architects. A committee consisting of Messrs. Babson, Wright, and Eisen were appointed to make a report upon the subject at that time. Secretary was instructed to announce the above-mentioned meeting in the usual manner.

Cats vs. Imperfect Plumbing.

An ingenious woman in Hoboken, N. J., recently invented what may perhaps prove to be an improvement on the peppermint test for leaky waste-pipes. Noticing an offensive odor in the parlor of the house which she occupied, she suspected a defect in the waste-pipes, and sent to the agent to request that a plumber might be sent to examine them. The agent assured her that the plumbing was perfect; but this did not satisfy her, and after consultation with her neighbors, she procured a vial of oil of peppermint and poured it into a washbowl in the upper story. The perfume of peppermint was soon apparent in the parlor, and the woman went again for the agent, assuring him that there must be a leak in the pipe on the first story. He was still incredulous, and to make her proofs still more convincing, she devised a new test. After borrowing two cats from her friends, she purchased some oil of valerian, and stationing the cats in the parlor, went upstairs, and poured the valerian into the basin, in the same way that the peppermint had been previously applied, and then descended to watch the result. Cats are extremely fond of the odor of valerian, and it was not long before both of them began to sniff the air, and move toward the door of a closet through which the waste-pipe ran. The door was opened for them, and they immediately sprang upon a certain shelf, where they remained, purring with satisfaction. A third time the woman went to the agent, who, though still unbelieving, consented so send a plumber to make further investigations, and on cutting away the plastering so as to expose the pipe, a joint was found completely separated at the place which the cats had indicated.—*American Architect and Building News.*

"Huckstering" Mill-Work.

The complaint is general among mill-owners in reference to a far too common practice among contractors, of what is termed "huckstering the mill-work" of buildings around, with a view to securing all legitimate, and sometimes forcing advantages of questionable, fairness. The complaint is reasonable in itself, and we presume fully justified by the prevailing practices of many contractors; but not all. Some rise to the right standard, and place true values to themselves upon work figured on by them, and are willing to accept what to them may appear as reasonable on the part of "mill-men" and others for the respective portions of the work contemplated.

It is presumed that when a contractor is intrusted by an owner or architect with plans and specifications for estimate, that the intention of the party figuring is to carry out as nearly as possible the true and fair meaning and requirements thereof. Upon receiving the plans the first effort is to secure a low mill bid. For this purpose one or several of the mill owners are requested to bid for furnishing the mill-work. In good faith the mill-man spends his time and labor, and gives to the contractor an estimate, for which he agrees to deliver at the building all such mill work as may be necessary to complete that part of the work. Securing the lowest bid, the contractor uses it for the purpose of forming a correct estimate to hand to the architect. Generally, before the bids are opened by the latter party, the estimates of the different mills are "*well talked over*" among the contractors. Upon the awarding of the contract, it has got to be too common a custom for the successful party to either segregate the work, or secure a still lower bid by visiting mills that have not figured on the work, and endeavor to obtain a lower estimate. Failing to obtain a concession, the contractor commences to *piece-work* the job. To one he will give the making of the frames; to another will be given the cornice, etc., and so on. It frequently happens that the mill work of several different parties is put into a house, the result being anything but favorable to the mill having the largest share of the work.

The contractors declare that they have a right to get their work done in the cheapest manner, as long as it is satisfactory to the architect. This we do not deny; it is in the *way they take* that is so galling to the mill-man. If the contractor should figure his own mill-work, and after a contract has been awarded to him should strive by all legitimate means to get the work done at a lower figure than his estimate, the mill-man would not have quite so just cause for growling. But, for the purpose of getting a low bid, for the contractor to go around and secure estimates by notifying the mill owners that the lowest bid would secure the work, and then after the contract has been awarded to endeavor by HUCKSTERING to secure a still lower figure, is a practice that cannot be too severely commented upon.

We have been repeatedly called upon to lay this matter before our readers, but have refrained from so doing, hoping that with the increasing volume of trade that is being showered in our midst the practice would become obsolete. The competition among mechanics, however, is so great, that the evil appears to be on the increase, and should call for energetic action from our mill-men.

The remedy is very simple. Let each mill-man keep a *black list*, in which should be entered the names of every one that is acting in accordance with the above complaint, and refuse in future to estimate upon any work whatever for such parties as seek to make a living by the HUCKSTERING OR PIECING-OUT of mill-work.

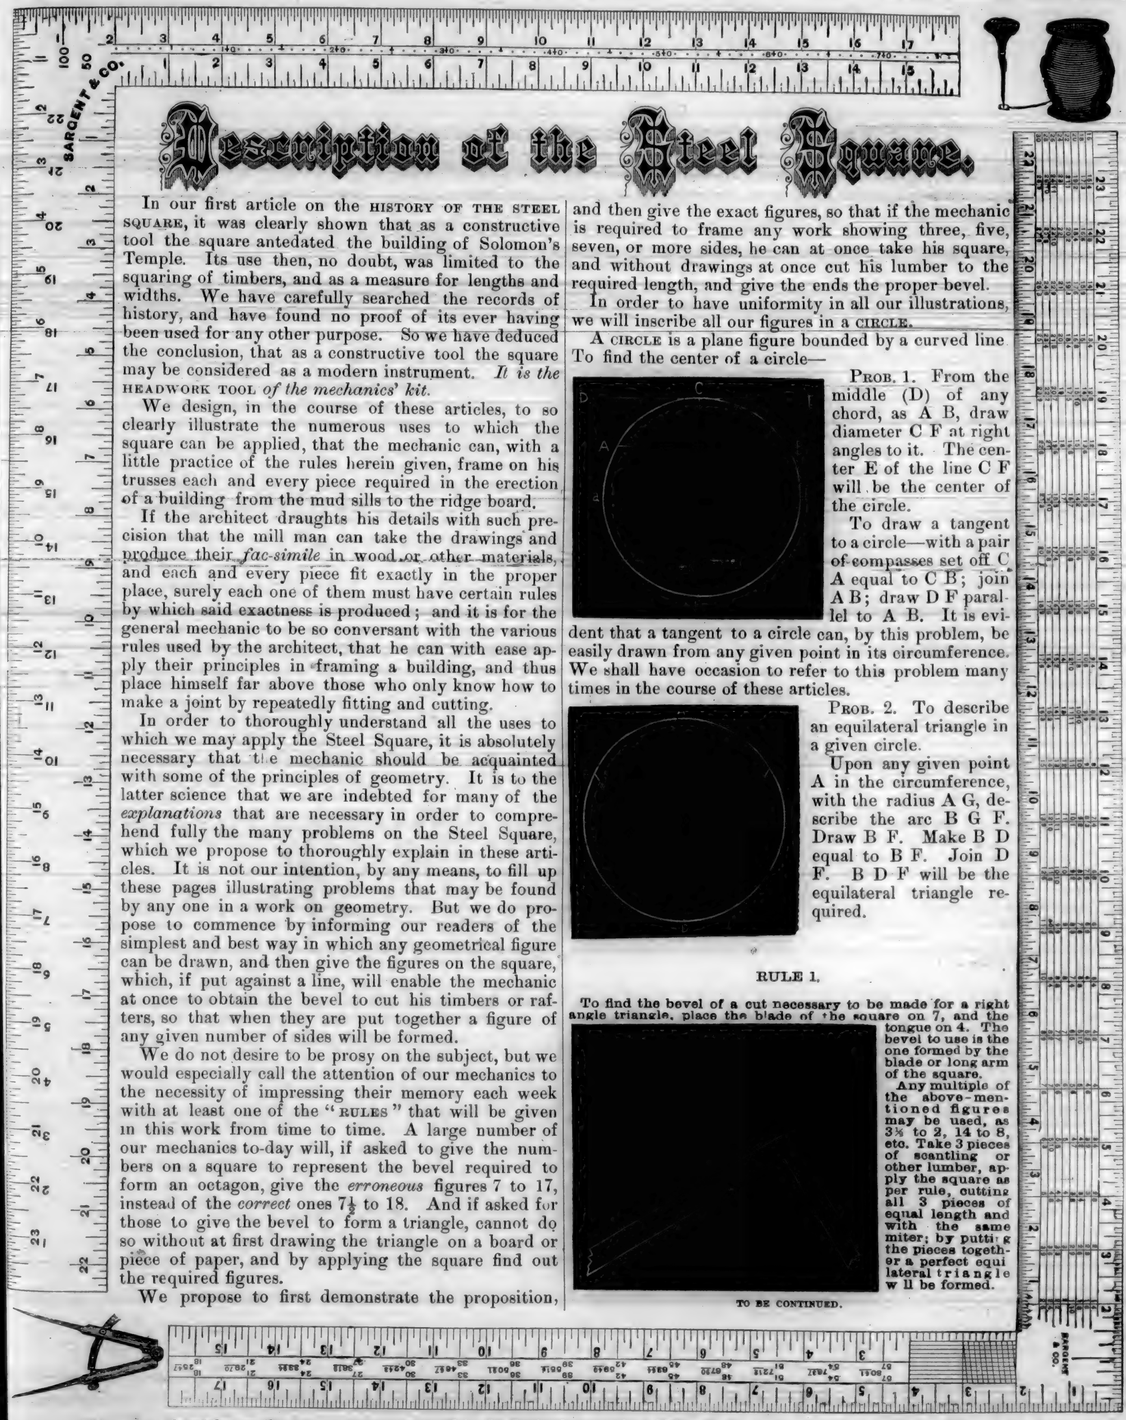
Fire-Proof Dwellings.

In view of the many destructive fires amongst domestic dwellings, we wonder that the use of light iron joists and fire-proof floors is not more extensive than at present. Half the danger and destruction resulting from a fire in some domestic dwelling would be avoided by the use of such. It is generally the case that fires are first discovered when localized by a single room, and it is only the rapid destruction of the whole of the interior of a dwelling house, and often serious loss of life, which we at present take as a matter of course. We think that in a few years to come the entire destruction of a dwelling because one room has caught fire will be thought as outrageous as the destruction of a row of houses from a conflagation in one would be at present. A fire may very easily be starved out by want of combustible material, a great deal easier than it can be extinguished by water when wood or other combustible material has once caught. In the localization of a fire in the room in which it occurred would lie best protection to life and property against fire. It is not as if such protective means need require excessive outlay. A floor of iron joists and non-inflammable material can be laid, we believe, almost as cheap as the present wooden floors. To complete the isolation of each room the doors may be made, at no increase of present cost of wood, so impregnated with chemicals that it is no longer inflammable. These improvements will surely come in time; like all others, they may be foretold long before the public eventually receives the benefit of them.—*The Mechanic.*

Registration of Draughtsmen.

Draughtsmen should awaken to their interests and adopt some place for their headquarters. We have on hand now applications from Oakland, Portland, Santa Barbara, and two offices in this city for draughtsmen. We have the addresses of several, but all of them happen to be busy. We want to make a complete directory of all the draughtsmen on this coast. We shall charge a fee for registering of $2.50. This to be paid only once, and entitles the one paying to the privilege of securing information in regard to work for as long time as he remains in the State, whether six months or six years. No other fee whatever will be exacted as long as the party's name is on our books. We have found it necessary to charge a small fee, owing to the fact that postage-stamps, etc., cost money; and in answering the various applicants, we have found that, in the course of a month, many stamps are necessary. We think that it is no more than right that the parties benefited should be the ones to pay the costs. Hence we shall exact a registration fee of $2.50.

☞ **Subscription price of this journal is $2.00 in advance.**



Description of the Steel Square.

In our first article on the HISTORY OF THE STEEL SQUARE, it was clearly shown that as a constructive tool the square antedated the building of Solomon's Temple. Its use then, no doubt, was limited to the squaring of timbers, and as a measure for lengths and widths. We have carefully searched the records of history, and have found no proof of its ever having been used for any other purpose. So we have deduced the conclusion, that as a constructive tool the square may be considered as a modern instrument. *It is the* HEADWORK TOOL *of the mechanics' kit.*

We design, in the course of these articles, to so clearly illustrate the numerous uses to which the square can be applied, that the mechanic can, with a little practice of the rules herein given, frame on his trusses each and every piece required in the erection of a building from the mud sills to the ridge board.

If the architect draughts his details with such precision that the mill man can take the drawings and produce their *fac-simile* in wood or other materials, and each and every piece fit exactly in the proper place, surely each one of them must have certain rules by which said exactness is produced; and it is for the general mechanic to be so conversant with the various rules used by the architect, that he can with ease apply their principles in framing a building, and thus place himself far above those who only know how to make a joint by repeatedly fitting and cutting.

In order to thoroughly understand all the uses to which we may apply the Steel Square, it is absolutely necessary that the mechanic should be acquainted with some of the principles of geometry. It is to the latter science that we are indebted for many of the *explanations* that are necessary in order to comprehend fully the many problems on the Steel Square, which we propose to thoroughly explain in these articles. It is not our intention, by any means, to fill up these pages illustrating problems that may be found by any one in a work on geometry. But we do propose to commence by informing our readers of the simplest and best way in which any geometrical figure can be drawn, and then give the figures on the square, which, if put against a line, will enable the mechanic at once to obtain the bevel to cut his timbers or rafters, so that when they are put together a figure of any given number of sides will be formed.

We do not desire to be prosy on the subject, but we would especially call the attention of our mechanics to the necessity of impressing their memory each week with at least one of the "RULES" that will be given in this work from time to time. A large number of our mechanics to-day will, if asked to give the numbers on a square to represent the bevel required to form an octagon, give the *erroneous* figures 7 to 17, instead of the *correct* ones 7½ to 18. And if asked for those to give the bevel to form a triangle, cannot do so without at first drawing the triangle on a board or piece of paper, and by applying the square find out the required figures.

We propose to first demonstrate the proposition, and then give the exact figures, so that if the mechanic is required to frame any work showing three, five, seven, or more sides, he can at once take his square, and without drawings at once cut his lumber to the required length, and give the ends the proper bevel.

In order to have uniformity in all our illustrations, we will inscribe all our figures in a CIRCLE.

A CIRCLE is a plane figure bounded by a curved line To find the center of a circle—

PROB. 1. From the middle (D) of any chord, as A B, draw diameter C F at right angles to it. The center E of the line C F will be the center of the circle.

To draw a tangent to a circle—with a pair of compasses set off C A equal to C B; join A B; draw D F parallel to A B. It is evident that a tangent to a circle can, by this problem, be easily drawn from any given point in its circumference. We shall have occasion to refer to this problem many times in the course of these articles.

PROB. 2. To describe an equilateral triangle in a given circle.

Upon any given point A in the circumference, with the radius A G, describe the arc B G F. Draw B F. Make B D equal to B F. Join D F. B D F will be the equilateral triangle required.

RULE 1.

To find the bevel of a cut necessary to be made for a right angle triangle, place the blade of the square on 7, and the tongue on 4. The bevel to use is the one formed by the blade or long arm of the square.

Any multiple of the above-mentioned figures may be used, as 3¾ to 2, 14 to 8, etc. Take 3 pieces of scantling or other lumber, apply the square as per rule, cutting all 3 pieces of equal length and with the same miter; by putting the pieces together a perfect equilateral triangle will be formed.

TO BE CONTINUED.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

Methods of Chemically Reproducing Drawings.

The following excellent account of the various processes in use for copying plans by the agency of light is translated in the *American Architect* from the pages of *Le Génie Civil:*

For reproducing a drawing at a different scale from the original, or for copying plans on very thick paper, the assistance of a camera, sensitive plates, re-agents of various kinds, and an operator skilled in the difficult manipulations of the photographic art will be needed; but anything which is or can be drawn in line on thin paper or tracing cloth may be copied with simple materials and without skilled assistance.

The simplest method of accomplishing this consists in the employment of the so-called ferro-prussiate or "Marion" paper, which is prepared by covering one side of the sheet with a mixture of red prussiate of potash (ferrocyanide of potassium) and a salt of peroxide of iron; under the influence of light, that is, under the white portions of the drawing to be copied, the ferric compound is reduced to the state of a ferrous salt, which gives with the red prussiate of potash an intense blue coloration, analogous to Prussian blue. This coloration is not produced in the portions of the sensitive paper protected from the light by the black lines of the drawing to be copied, and on washing the print the design appears in white lines, on a blue ground.

The formula for preparing the sensitive paper is as follows:

Dissolve 8 parts of red prussiate of potash in 70 parts of water; dissolve separately 10 parts of ammoniacal citrate of iron in 70 parts of water; filter the two solutions through ordinary filtering paper, and mix them. Filter again into a large flat dish, and float each sheet of paper to be sensitized for two minutes on the surface of the liquid, without allowing any of this to run over the back of the paper. Hang up the sheets in a dark place to dry, and keep them from light and dampness until used. They will retain their sensitiveness for a long time.

The paper being ready, the copy is easily made. Procure either a heavy sheet of plate glass, or better, a photographer's printing-frame, and lay the drawing to be copied with the face against the glass; on the back of the drawing lay the prepared side of the sensitive paper, place upon it a piece of thick felt, and replace the cover of the printing-frame, or in some other way press the felt and papers firmly against the glass. Expose, glass side up, to sunshine or diffused daylight, for a time varying with the intensity of the light and the thickness of the paper bearing the original drawing from a few minutes to several hours. It is better to give too much than too little exposure, as the color of a dark impression can be reduced by long washing, while a feeble print is irremediably spoiled. By leaving a bit of the sensitive paper projecting from under the glass, the progress of the coloration can be observed. When the exposure has continued long enough the frame is opened and the sensitive sheet withdrawn and thrown into a pan of water, to be replaced immediately by another, if several copies are desired, so that the exposure of the second may be in progress while the first is being washed and fixed. The water dissolves out the excess of the re-agents used in the preparation of the paper, and after several washings with fresh water the print loses its sensitiveness and becomes permanent. It is advantageous, after several washings with water, to pass over the wet surface a weak solution of chlorine or of hydrochloric acid, 3 or 4 parts of acid to 100 of water, which gives brilliancy and solidity to the blue tint, and prevents it from being washed out by long soaking. This should be followed by two or three rinsings with fresh water, and the print may then be hung up to dry, or placed between sheets of blotting paper.

This mode of reproduction, whose simplicity has led to its adoption in many offices, has the inconvenience of giving a copy in white lines on a blue ground, which fatigues the eye in some cases, while the application of other colors is impracticable. By repeating and reversing the process, copying the white line print first obtained on another sensitive sheet, a positive picture, representing the black lines of the original by blue lines on a white ground, can be obtained; or the same result may be reached by a different mode of treating the sensitive paper.

Several varieties of paper called "caynoferric," or "gommoferric," are sold, which have the property of giving a positive image. The mode of preparation is nearly the same for all: Three solutions, one of 60 parts by weight of gum-arabic in 300 of water; one of 40 parts ammoniacal citrate of iron in 80 parts of water; one of 25 parts perchloride of iron in 50 of water, are allowed to settle until clear, and are then decanted, mixed, and poured into a shallow dish, the sheets being floated on the surface as before, and hung up to dry. The solution soon becomes turbid, and must be used immediately; but the paper once dry, is not subject to change, unless exposed to light or moisture. The reactions involved in the printing process are more complex than in the first process, but present no particular difficulty. Under the influence of light and of the organic acid (citric) the perchloride of iron is reduced to a protochloride, and on being subjected to the action of ferrocyanide of potassium the portions not reduced by the action of the light, that is, the lines corresponding to the black lines of the original drawing, alone exhibit the blue coloration. The gum plays also an important part in the process by becoming less soluble in the parts exposed to light, so as to repel in those portions the ferrocyanide solution. The mode of printing is exactly the same as before, but the paper is more sensitive, and the exposure varies from a few seconds in sunshine to fifteen or twenty minutes in the shade. The exact period must be tested by exposing at the same time a slip of the sensitive paper under a piece of paper similar to that on which the original drawing is executed, and ruled with fine lines, so that bits can be torn off at intervals, and tested in the developing bath of ferrocyanide of potassium. If the exposure is incomplete, the paper will become blue all over in the ferrocyanide bath; if it has been too prolonged no blue whatever will make its appearance, but the paper will remain white; if it is just long enough, the lines alone will be developed in blue on a white ground.

During the tests of the trial bits the printing-frame should be covered with an opaque screen, to prevent the exposure from proceeding further. After the exact point is reached the print should be removed from the frame and floated for a few moments on a bath of *saturated* solution of ferrocyanide of potassium, about one part of the solid crystals to four of water. On raising it the design will be seen in dark blue lines on a white ground. It is necessary to prevent the liquid from flowing over the back of the paper, which it would cover with a blue stain; and to prevent this, the edges of the print turned up all around. On lifting a corner, the progress of the development may be watched. As soon as the lines are sufficiently dark, or blue specks begin to show themselves in the white parts, the process must be immediately arrested by placing the sheet on a bath of pure water. If, as often happens, a blue tint then begins to spread all over the paper, it may be immersed in a mixture of 3 parts of sulphuric acid, or 8 parts of hydrochloric acid, to 100 parts of water. After leaving it in this acidulated liquid for ten or fifteen minutes, the design will seem to clear, and the sheet may then be rinsed in a large basin of water, or under a faucet furnished with a sprinkling nozzle, and a soft brush used to clear away any remaining clouds of blue; and finally, the paper hung up to dry.

The ferrocyanide bath is not subject to change, and may be used to the last drop. If it begins to crystallize by evaporation, a few drops of water may be added. The specks of blue which are formed in this bath, if not removed by the subsequent washings, may be taken out at any time by touching them with a weak solution of carbonate of soda or potash. The prints may be colored in the usual way.

Rapid Destruction of Lumber East.

The most of the lumber now used in the Atlantic States is drawn from Michigan, Minnesota, and Wisconsin. It has lately been officially estimated that the supply of lumber in those States will be exhausted in ten or eleven years. When the supply in those three States is exhausted, it is almost certain that the Atlantic States will begin to draw upon the red and pine woods of the Pacific Coast for building lumber and railroad ties. The destruction of timber for these and other domestic purposes East is unparalleled. During the year 1881, over one billion eight hundred million feet of lumber entered Chicago alone. Redwood and good pine timber land on this coast will advance very much within the next ten to fifteen years, we think. On the subject of the rapid destruction of timber, the N. Y. *Nation* says:

Chicago is now the greatest lumber center the world has ever seen. Its shipments reach the Atlantic and to beyond the Rocky Mountains. The Chicago Lumber Exchange regulates the lumber trade of the country. In lumber Chicago is king; but its reign is almost over. Its immense lumber yards will soon be empty, and with the pine forests of the lakes will disappear the commercial advantages which its central position in relation to these forests has given to it as their chief point of distribution. No city of the United States can ever hope to rival Chicago in the volume of its present lumber business. New Orleans or San Francisco will probably become the successful competitor in the race for second place. Both are the natural outlets for vast forests of great commercial importance, and both are conveniently situated for a great foreign and domestic lumber trade.

Science of Perfumes.

By a process known as infleurage, which is the exposure of beef fat to fresh flowers in close boxes until it is thoroughly permeated and charged with their odors, the perfumes of six flowers are obtained, which could in no other manner known to science be preserved apart from the fresh petals. Those flowers are violet, jasmine, tube-rose, rose, orange flower, and cassic (cinnamon flower). From those six there are fifty or more combinations made for the simulation of the odors of other flowers. Sweet-pea is made with jasmine and orange flower; hyacinth is counterfeited by jasmine and tube-rose; lily of the valley by violet and tube-rose. But the resources of the perfumer are by no means confined to the pomades, as the scented fats are termed. He uses many essential oils, the principal of which are sandal-wood, bergamot, lemon, rosemary, neroli (made from bitter orange flowers), patchouli, and ottar of roses. It is very difficult to get the last named in a pure state, because its great cost tempts to dishonest adulteration. Very often rose-geranium oil is substituted for it. Musk is another important ingredient, entering, as it does, into almost all perfumes, except those which are actually imitations of flower odors, or, as styled by perfumers, "natural," as, for instance, heliotrope, tube-rose, white rose, and violet.—*Boston Herald.*

The Consistency of San Francisco Architecture.

Architecture, or the art of constructing abodes for mankind, has its origin in the human necessities, as regards shelter and protection. And as the exigencies in reference to the climate of different portions of the world, combined with the social and business relations of inhabitants of any stated era and place, are and have been of such various natures, so must architecture, to be true and consistent with the appellation, be in strict concord with such deviations of custom.

The earliest houses that were built having perished long before histories were written, such structures therefore cannot now be recorded nor described. It is, however, easy to conceive, though impossible to know with certainty, how they arrived at their different stages of improvement; for, as we have above alluded, architecture must have owed its birth to necessity, as it owed its embellishments afterwards to luxury.

Man's first care would naturally be directed to the discovery or construction of some kind of shelter against the inclemencies of the weather the region in which he was placed; for as cold in and heat in their extremes could not well be endured under the bare canopy of heaven, his best affections, no less than his natural wants, would prompt this. The cave of the Egyptian shepherd or the hut of the savage are no more connected with science and forethought than the lair of the wolf or the more artful structures of the fowls of the air.

Probably one of the first authenticated accounts rendered us of building in contradistinction with the primitive abodes above referred to, we find in the eleventh chapter of Genesis, when they built a city upon the plains of Shinar, "and a tower reaching up to the heavens." But as to the style and taste displayed, we know of nothing more than their work, taken from an artificer's standpoint, must have been of a substantial character.

Now let us consider the above as fundamental to the various degrees of improvement which is manifest in the architecture of succeeding eras. Let us begin with the time when Cæsar invaded England, and which was immediately afterwards characterized by England accepting the more advanced and enlightened ideas of Roman work, in striking contrast with the wattle and clay huts which were formed by stakes driven into the ground, interwoven with wicker-work, and afterwards having the interstices and crevices filled with moss, daubed upon the exterior with clay, and the roof thatched with dried coarse grass as security against the weather. Let us touch upon the various degrees of improvement succeeding the same; works under the Norman *regime*, owing their massive construction and battlemented parapets to the warlike spirit of the time, and indicative of ordinary comfortable shelter, allied with defense against invasive trespassers; works under the Plantaganets and following reigns, where fortication qualities are secondary to the luxury and comfort of the people.

In accepting England as a criterion of progression, we do not intentionally overlook the Roman and Grecian empires, the cradle of architecture; but our reference to the Saxon work being made, as being a more thorough exemplification of progression, resulting in the present degree of perfection or imperfection attending our present condition. Our present condition! What is it? Are the works now being constructed and prosecuted by the enlightened community of the nineteenth century, and particularly of San Francisco—are they in as strict concord with the usages, customs, and conditions of the people? Are they as thoroughly consistent with our wants and domestic customs as the primitive huts were to the inhabitants of the barbarous ages? In a measure, we are regretfully compelled to answer in the negative; for apparently the designs of façades, as exhibited in our modern buildings, fall far short in a majority of cases of being a truthful index, of the purpose and method of construction of the same. We must admit that we are but sham imitators of truthful import.

What is more inconsistent than a huge pile of brick and mortar carried up until the required altitude is attained, during which performance wooden scantling brackets are left protruding for the purpose of retaining cornices, belt courses, bay-windows, and massive pilasters supporting the same, and which are affixed after the structure has been virtually finished, and not until then is the work deemed substantial and correct.

We heard a gentleman exclaim the other day, upon perceiving a remarkable truthful representation of oak graining executed upon a redwood surface, "What a palpable lie!" We suppose the interpretation of this utterance in thorough terms would be, that a commonly called "white lie," relying upon its own merits as a lie only, would be admissible, and deserving of some honor; but a lie or sham assuming the arrogance of a truthful representation, and withholding the least key to the penetrable eyes of truth, is beyond all claims to respect.

We are compelled to admit that the mass of our designs to be perversions of truthful intent, in reference to the copied style prevailing, considered with the modes of construction and materials used; but are we, as architects, to blame? No, and yes; *No*, because many of our profession, whose daily bread is dependent upon their avocation, and perchance in the employ of a client whose architectural ideas are orthodox in a local sense, and persistent that his structure shall possess all the parasitical appendages upon its face, in the shape of galvanized iron, wooden, and cemented ornamental work, jointed, perhaps, with putty-knife rulings; are they, then, to refuse him the culmination of his fancies, and jeopardize his consideration in the way of lucre? However great our allegiance may be to the glory and honor of the profession, the temptation to cater to the necessaries of life will generally override many conscientious scruples relative to our professional feelings and pride, and we are thus prone to yield to the desires of our employer.

Although there are cases in which an architect is granted full license to render, both in design and in plan, as he may deem worthy and practicable, he in such a case bears the entire responsibility of the completed works, assuming the satisfactory standard, in a speculative point of view, to the eyes of the owner, aside from the many adverse criticisms oftentimes tendered by such an owner's friends. What bliss it is for an architect to have but the owner to satisfy! an owner with judgment to guide and direct, as he may desire, independent of the many proffered suggestions, both *pro* and *con*, from members of his social and business circles, is indeed a boon to an architect.

It being an architect's misfortune to have his productions monumental, and occular illustrations of his ability or disability, as the case often is, it is indeed unfortunate for him that his inspirations should be so biased by extraneous causes, and for which denial of executive freedom he has no remedy, save that of ability and standing, acknowledged by the public at large, and which is generally only attained by years of so-called experience, and independence, perhaps, in a pecuniary sense. We therefore offer this last in palliation for a San Francisco architect to essay productions, for which he himself may have no sympathy with. Thus far for the negative; and in assuming the affirmative to the question above cited, "Are we as architects to blame?" we vouchsafe the statement that the fault has lain with the architects as a body in their failure in establishing a precedent as to genuine artistic taste, and which we are happy to state is now fast being acquired. You perhaps ask the question how, to which we answer, by what we are now doing, and have been doing the past year, enjoying a professional union, at present as a local body, and perhaps in the immediate future in constituting ourselves a chapter of the "American Institute of Architects."

As a local body we stand before the public, not as members of a trades-union, nor of a protective association, guaranteeing ourselves a stated commission as compensation for services rendered, but as a body whose members meet in social fellowship for the exchange of professional ideas and the promulgation of high art, endeavoring to establish that model of taste in design and adaptation to climate and materials as shall be consistent with the wants of our community; and with the help of our Eastern brethren serving to mold the architectural ideas of the general public into that channel which leads to perfection.

Having so far touched upon an evil and the hopes of eradicating the same, let us now go farther into the minutiæ of this evil, and where these departures from the path of architectural rectitude lie; and having so far opened fire upon brick business blocks, with non-fireproof excrescences, let us now direct our artillery upon those wooden houses, sometimes styled mansions, those models of classic architecture, with Frisco-American variations, and of which the more humble often exhibit the best evidence of taste, as exemplified by the sides and rear of such houses, looking upon the back yards, where at least there is no sham, but the outlines of an honest shingle roof.

Imagine the incongruity of these honest outlines being concealed upon the principal façade by a classic cornice, balustrading and ribbed parapets, porticoes supported by massive columns, these in turn borne by concealed two-by-four and four-by-four-inch posts, all of these adornments constructed of wood, and with the ingenuity of the house-painter so dyed as to represent the clearest white marble or the exquisite sandstone, and as such appears until the sun has left its gauge-marks in the nature of warps, checks, etc., a glaring condemnation and advertisement of "sham"—"I wood I were, but I am knot."

If we must have the bodies of our houses constructed of wood, in compliance with our desires as California residents, and which seem to have been principally instigated by the fear of earthquakes and the close proximity to the timber regions, why shall we not allow the materials to suggest the style, and not allow the incubus of a foreign style to fasten its tentacles upon bogus rock?

The advent of the prevailing Eastern domestic architecture should be hailed with satisfaction in our midst, and with certain modifications is undoubtedly consistent with the above interpretation. Why should not we as Californians, a people famed for their originality, be at par with the humble Swiss, who in his chatelet shows no prevarication of its construction; on the contrary the lines of beauty delineated in its adornments, being in quiet harmony with the surroundings, and a truthful index of its formation and uses.

In closing and in recapitulation, it behooves us to maintain the credit which is due San Francisco in the production of works, which certainly, as far as pertaining to the tenantable convenience of its hotels, business blocks, and residences, it bids fair to ultimately rank secondary to none; and here we again exemplify that architecture is contingent to the customs and conditions of mankind. The mass of San Fancisco's residents, living in better style proportionate to their circumstances than perhaps elsewhere, their abodes are endowed with the latest improvements conducing to comfort and ease, and

the interior arrangement of our houses is generally of a high and novel order.

But this is not sufficient for the rapidly increasing refinement of our people. Gratification to physical comfort does not satisfy a refined mind, unless that comfort is associated with the truly beautiful and consistent adaptation.

"Such is the strength of Art, rough things to shape,
And of rude commons, rich enclosures make."

THEO. A. EISEN.

Removal of Fixtures.

During the past month we have been consulted in several instances in regard to the liabilities of landlord and tenant, and the right of the latter to remove gas fixtures, bells, etc., which he may have placed in a building during his occupancy thereof. We have examined the law applying to such cases, as given in various decisions in courts in different parts of the country, and give the result in as concise language as possible:

"The presumption of law which arises from 'the position of the parties,' when they stand to each other in the relation of landlord and tenant, is one in the least degree favorable to an intention to permanently benefit the freehold; in fact, an intention to permanently benefit the freehold, on the part of a tenant annexing articles to the soil, can never be presumed solely from the relation of the parties as landlord and tenant.

"It will depend in a great degree of a consideration of 'the mode and degree of annexation,' 'the nature and character of the fixture, and the use for which it is intended,' to determine whether a fixture is 'movable' or 'irremovable'; in other words, these two latter incidents now become the most important *indicia* of the intention.

"If the article is so firmly annexed to the freehold, or incorporated therewith, that it cannot be removed without permanent injury to the freehold, the tenant will not be allowed to remove it. It is a proper question for a jury to determine whether the removal of a fixture would cause substantial injury to the freehold, and such a direction on the part of the judge is a good test of the mode and extent of annexation."

"Where a yearly tenant of a house had, at his own expense, hung bells, but quitted the premises without removing them, it was held that, by remaining fixed to the freehold after the expiration of the term, they become the property of the landlord, and that the tenant could not maintain trover—*i.e.*, action for goods found—for them after the landlord had severed them from the freehold."

In a later case, the tenant had caused to be placed in the building a system of electrical bells, for his own convenience, and claimed the right to remove them, although in his lease all improvements were to revert to the landlord. The tenant did remove them, and the landlord recovered full damages, with a little extra thrown in.

"In the absence of a special contract, tenant's fixtures cannot be removed after the termination of a lease, and this rule applies whether the lease determines by effluxion of time or by re-entry on forfeiture."

The result of the authorities may be stated—first, that fixtures go, at the expiration of the term, to a landlord, unless the tenant has, during the term, exercised his right to remove them; secondly, that the tenant may remove the fixtures, notwithstanding the term has expired, if he remains in possession of the premises; thirdly, that his right to remove fixtures after his term has expired, is subject to this further qualification, viz., that the tenant continues to hold the premises under a right still to consider himself as tenant.

"The right of a tenant to sever and remove movable fixtures is frequently governed by express covenants. When this is the case, the rights of the parties will, of course, depend upon the legal constructions of such covenants."

"A general covenant to repair extends not only to buildings but to fixtures, and a tenant is precluded by such a covenant from removing fixtures. A tenant may also deprive himself of his right to remove fixtures, by undertaking to repair and yield up in good repair, improvements and fixtures.

"If a tenant, on the determination of his tenancy, takes any fresh interest in the premises, he should take care to reserve expressly his right to remove those fixtures which he had, under the old tenancy, a right to sever and remove, otherwise the tenant may lose his property in them altogether; and it may be generally stated that the right of a tenant to remote fixtures may be divested by any new agreement for the use and employment of the land in which there is no mention of the fixtures. Suppose a tenant from year to year, or without any express covenant to repair, erects structures or improvements, and subsequently takes a lease of the same premises, with a general covenant to repair, the lessee would be restrained from removing those fixtures at the determination of the tenancy so created, although he might have removed them previously to the commencement of his lease.

"Where the outgoing tenant stipulates with the incoming tenant for the purchase of the fixtures at a valuation, the landlord should, in all cases, be made a party to such an agreement; otherwise, if the fixtures are allowed to remain until the incoming tenant has taken possession, the landlord may dispute the right of purchase and sale, and claim the fixtures, on the ground that the outgoing tenant has divested himself of the right to remove the fixtures by neglecting to exercise his right during the term."

Paper-Hanging.

The art of putting on, or "hanging" paper is very simple, and is easily learned; but to make a tasteful choice of paper for various situations is not so easy, hence the following remarks, which may be of service to the workman or others on whom the selection of paper may devolve.

Walls to a room should be regarded only in the light of a frame-work to what the room contains, and should be decorated so as to bring into prominence, and not eclipse, the other parts of the chamber. Nothing destroys the effect of a room so much as a handsome but staring wall paper, or a wall so profusely ornamented as to strike upon the eye to the exclusion of the rest of the decorations, thus bringing forward what should be the background into the most conspicuous place. A modern drawing-room is always difficult to decorate artistically, because of the taste of its builders for heavy cornices, prominent mantelpieces, and rooms too lofty for their size; and as all these misnamed "embellishments" are too costly to remove by tenants, the only plan to pursue is to destroy their effect by exercising both taste and ingenuity. First, with regard to the ceiling, the ornamental plaster boss in its center should be removed, and the ceiling tinted a color that harmonizes with the wall paper, as no harmonies can be hoped for when what produces them is surmounted with the glaring white of an ordinary ceiling. The tint used must be one that softens into the wall paper, not one that contrasts; thus, if the tone of the room is that of a soft gray-blue, the ceiling should be a clear flesh-pink; or should a gray-green, picked out with black, be the chosen color, then it should be colored a subdued lemon.

Some people cover their ceilings with a whole colored paper, and border it with a stenciled pattern representing the thin garlands so familiar upon Queen Anne decorations; but this is a more troublesome plan than the simple coloring, which answers all the purpose. The walls, if they are lofty, require a high dado. These high dadoes give a look of comfort and "home," that is absent from the modern high pitched room papered with one uniform pattern. The dado is divided 3 feet to 4 feet from the ceiling, and the coloring of the lower portion must always be heavier than that used on the upper, or a top-heavy look will be given to the room. When many pictures are to be hung up, the lower part of the dado should be of a whole color, either a whole colored paper, or a painted wall, as pictures are only shown off upon such a background. Where a whole tint is used for the lower part of the dado, the upper portion should be decorated with a frieze paper of a good bold pattern, but of subdued coloring, and of tint that harmonizes with the lower. Thus, the color used about the frieze should be the same as that on the lower part, but of a lighter shade, intermixed with some other colors that form a harmonious link between the two shades. Contrasts must be carefully avoided, but pale pinks, blue, and ambers can be blended together above a subdued gray-blue ground. The two portions of the dado should be joined together with a light wooden (black or brown) railing, or with a line of paint.

The dado decorations can be altered by placing the pattern paper upon the lower part, and leaving the upper plain colored, with or without a stenciled pattern upon it. This will suit a room where not many pictures are required, or that is already rather dark. Some part of the wall should always be in plain color, as the eye requires rest; and no pattern, however subdued in hue, can give the relief to the mind that a bit of plain coloring affords; and this scarcity of ornament in one part of a room is amply repaid by the effect it gives to such parts as are bright and should be bright. The true theory of effect is to use but one or two bright colors in a room, and to surround them by soft and subdued tints that throw up and do not destroy their brilliancy; a number of bright colors placed together destroy each other, and leave no impression upon the mind but glare and vulgarity. Having settled upon your paper and ceiling, have the wood-work and cornice of the room painted either a shade lighter or darker than the walls, and shroud up the mantelpiece with curtains, etc., of satin sheeting embroidered with crewels, and instead of the usual looking-glass over the fireplace, have a mirror surrounded with brackets holding china; or have a black, wooden mantelpiece made with squares of looking-glass set in. The background of your room being thus completed in a manner really to be a background, your furniture will look twice as well as if it were stared out of countenance by the walls; and one need hardly add that all your friends will delight in a room that throws up and brings out their dresses and faces, instead of killing them by its glaring tints.—*Hints for Painters.*

Asphalt, and its Commercial Value.

Asphalt, on account of the high value it has in the market, is often adulterated with coal-tar pitch. Formerly, its purity was determined by testing its elasticity, or determining the depth to which a weighed iron point would penetrate. These, however, are unsatisfactory for practical determinations. A new method proposed by H. Hauschild is as follows: One gramme, which has previously been heated up to 200°, is shaken up with five cubic centimeters of alcohol. If the solution contains only two per cent. of pitch, it will show a distinct yellow to green fluorescence, which becomes more intense as the percentage of pitch increases.—*D. Töpf. and Zgl. Ztg.*, 12, 401.

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

[While this column is open to all, farmers as well as mechanics, engineers as well as architects, we would call particular attention to one and all to have their questions and the information desired to be in accord, as far as possible, with the interests of this journal and for the carrying out of those principles for which the only monthly of its kind this side of the continent, was established. We will endeavor to answer all questions in a fair and impartial manner, and if it becomes necessary, will furnish cuts for the illustrations of any problem, provided we regard the solution thereof as beneficial to the majority of our readers. We would urge upon our patrons the necessity of being pointed in their questions, concise in the language used; let the writing be distinct, and one side of the paper only to be used; give full name and address, and particularly mention if their proper name shall be used.

We want it distinctly understood that the responsibility of signed articles rests with the authors.

Correspondents will please direct all communications to the business manager of this journal—240 Montgomery street, rooms 12 and 13.]

The preparation of ceilings for whitewashing (or calcimining as this operation is sometimes pretentiously called) is an operation requiring some skill and knowledge of "how to do it." A dirty ceiling, which has been subjected to successive coats of whitewash, whether of lime or of whiting and glue-size, cannot be made solidly and smoothly white by additional whitewashing. The mass has become spongy and sucks up the water so quickly that the material cannot be evenly distributed. In such case the only way is to begin anew, to go at once "down to hard pan" by removing all the previous applications by washing and scraping. This is best effected with a broad-bladed, square-pointed putty-knife, keeping the ceiling wet meanwhile. Plaster (hard finish) is not of uniform density, and some spots are much more absorbent than others. To remedy this a mixture of soft soap and alum, dissolved in water, should be applied with a broad calcimine brush. A mass of unsuitable material may be cheaply put upon a ceiling; but when the same shall require repainting, the cost of labor will be greater in removing the previous coating than will be the whole cost of repainting. These remarks, too, apply equally to all kinds of painting; and reference is made to the whitening and tinting of ceilings only because of the general impression that this kind of work may be performed by anybody. . . . .

White lead improves by keeping, and when of good quality will go much farther and last much better than when employed fresh; moreover, paint made with new lead has a tendency to become yellow. It should not be exposed to the air or it will turn gray.—*Work Manual No. 3.*

Printing from electrotypes was first successfully practiced in 1841, by Jos. A. Adams, a wood engraver of New York.

West Virginia produces nearly one-quarter of all the nails made in the United States.

False Report Corrected.

In time for our last issue we received a letter from Woodland, Yolo County, furnishing what was supposed by us to be reliable information in reference to the erection of a building at that place. Not supposing that Yolo County could produce a character so despicably mean as to practice the deception of sending us a statement of the kind referred to, containing not a word of truth in any particular, we gave it a place in our list of building reports. As suggested by the *Woodland Democrat*, which journal referred to the matter, it is a pity there is not a law for the punishment of such characters. No man having the least degree of manly honor in his composition would descend to any such unclean work; and we do not begrudge the small-minded Woodland falsifier all the pleasure derivable from his—well, we presume he thinks it smartness.

The Chinese Craze.

The civilized but sadly unenlightened world is just now greviously afflicted with crazes, due, let us hope, to the culmination of the period of sun spots, and, like the solar disturbances, likely soon to wane and leave the world sane again.

One, perhaps the worst, symptom of the malady shows itself in malignant attacks by the noble Caucasian upon so-called inferior races, because of their unwarranted successes in the struggle for wealth and position. In Europe, the terrible Shemite is the victim. The Jew is essentially bad, and a peril to Christian civilization, because he is industrious, thrifty, prudent in business, and determined to get on in the world. He wickedly amasses wealth, crowds himself into high places in the professions, in art, in literature, and threatens to make himself the political as well as the financial master of Europe. So the noble Caucasian cries, "Down with him!" and, where circumstances favor, proceeds to put him down by mobbing him, destroying his property, and outraging his wife and children.

On this side the Atlantic the anti-Shemitic mania afflicts but few; but the anti-Mongolian mania threatens to be general. Already it has raged in Congress to a degree calculated to humiliate all sane Americans now and for years to come. The pictures which Congressmen draw of the certain submergence of Christian civilization in this country by swarming hordes of heathen Chinese is so appalling that Congress threatens to pass a law to prevent it by stopping immigration from that side of the world; thereby adoptiug towards the Chinese the same policy of exclusion which the Chinese so long exercised against the "outside barbarians." Having compelled China to open her ports and allow Americans to go thither to trade and to upset by missionary operations the social and religious order of the empire, the superior race now finds itself in the position of the fisherman in the Arabian Nights after he had forced the cork of the magically sealed bottle and would fain have the genie shut himself up again. The case would be pitiful if it did not originate in craze and lead to national dishonor.

The reasons for abusing and excluding the Chinese are curiously like those given in Europe for similarly treating the Jews. At first it was said that they were poor and filthy and ignorant; that they were religiously perverse; that they were incapable of becoming good citizens; that they did not, or would not, or could not, "blend" socially and vitally with the superior Caucasian. Now their great fault is that they will not keep down; that they actually aspire to dominate; and that when suffered to compete with their superiors, they show a capacity to come to the front that is positively alarming. The following from the San Francisco *Alta* illustrates this phase of the subject with curious felicity. Changing "Chinaman" to "Hebrew," it might be mistaken for a literal translation of recent French, German, or Russian utterances arising from the peculiar though kindred race mania prevailing in Europe. The *Alta* says:

"Wherever a Chinaman gains a foothold there he stays. If, for instance, our lumbermen were to adopt that class of labor, they would exclude other competition, and finally find themselves dependent upon the heathen Chinese. What that dependence means, all who have experienced it know. It means the supremacy of Chinese over Americans. When the Chinaman runs out an American, it is only a question of time when the Chinese capitalist shall run out the American capitalist. His money is cheaper, as the labor of his countrymen is cheaper. In every employment they have entered the Chinese have mastered their work. They are the best imitators in the world. The man who belittles or minimizes a Chinaman is a fool. The Chinese are dangerous because they are adepts. In all the arts and sciences we find them rapidly catching up with modern progress. They are reaching out everywhere. It was but recently that the advent of a Chinese ship created commotion on the Thames. It will create more commotion before they are done with it. The Chinese go to stay. A few rebuffs do no dishearten them. Knowing their capacity to underlive and undersell their competitors, they are tenacious in the extreme. They don't know any such word as fail.

"If the Chinese were intellectually inferior to Caucasians the danger would be less. But they are not. In commerce especially they are the keenest, wisest, and most forehanded people in the world. Besides, they live cheaper, and can afford to undersell us. Merchants of San Francisco, take this point into your consideration and digest it. You cannot, if you would, evade it. It is a foregone conclusion that every trade the Chinese are admitted into they will finally control. And when Chinese laborers or operatives have displaced Americans, it is simply a little while until Chinese capitalists give their American compeer 'the grand bounce.' They get money cheaper; they live cheaper; how can you compete with them? It can't be done. Our only resource lies in exclusion. We do not sow our fields with thistles, neither should we permit noxious weeds to overspread our commercial garden.

"Merchants of San Francisco, you have a great and pressing duty to perform. Your self-preservation demands Chinese exclusion. See to it that you exclude them in time; else you shall ultimately find your investments unprofitable, your business withering, and your occupation gone. With a full knowledge of the probable effects, we sound this note of warning to American capitalists. They cannot compete with the cheaper capital of China."

"Bill Nye" was a true prophet; and to be consistent, before the craze passes, Congress ought to pass a resolution to the following effect:

"*Resolved:* America is the home of the Free and the land of the Brave. We are the Smartest people in the world. Our national doors are opened wide; but all immigrants must come under bond that they will not try to compete with Us."—*Scientific American.*

Our Illustrations.

Plates 1 and 2 represent a front and side view of a very handsome residence now being erected on the southeast corner of Post and Gough, for Jacob Levi, Esq. Plates 3 and 4 being the ground plans for the same. Its cost will be about $20,000 when completed.

Henriksen's Elevater Clutch.

We are pleased to notice the success that has met our fellow-townsman B. E. Henriksen, and his safety clutch. His present address is 108 Liberty St., New York City. Boston, Chicago, Baltimore, and Philadelphia are in his line of travel; and from the flattering notices that have been given of his invention in many of the eastern journals, we have no doubt he has met with the success due to his San Francisco invention. We hope soon to see his smiling, happy face, and can assure him of a hearty welcome back to his home.

The Discussion of the Academy of Medicine on Plumbing.

At the last meeting of the New York Academy of Medicine, recently, the subject of plumbing, introduced at the last previous meeting, was continued in a paper with the somewhat mysterious title: "The Struggle for Life against Civilization and Æstheticism," by Dr. Frank H. Hamilton, whose name was made so familiar to the country and the world last summer, as consulting physician in the case of President Garfield.

It first reviewed briefly the paper of the preceding meeting, and the discussion upon it, and criticised some things that were then said. Speaking of plumbers, the author expressed his belief that, as a class, they were as honest and upright as any other class of citizens, and as anxious to do good work according to their knowledge. But they had many difficulties to contend with; as, for instance, the fact that

"No pipes are perfectly impervious, as Dr. Doremus very conclusively showed, a few weeks ago, by passing various gases through them. And even though they could be made impervious they will not last more than a few years—the length of time depending on their thickness, the character of the substances passing through them, and their exposure to the oxidization of the air. So it may happen that there may be a leak in the pipes which no foresight can prevent; and though, by pouring oil of peppermint in the pipe, you may prove that there is such a leak, you may not be able to find where it is. All these difficulties are increased by the fact that the pipes in our houses are generally incased in plaster or courses of brick-work, where their defects can be neither seen nor remedied."

He said that by means of sewer gases, it was certain that typhoid fever and diphtheria were propagated, and it was his own conviction that many other zymotic diseases, as Asiatic cholera, might be, and sometimes were, propagated by them. It was thought by many that it was enough for safety to have water traps, but it was well known, he said, that water was no protection against these foul gases, for they readily passed through it. There was no remedy, he said, against sewer gas except the proper use of chemicals, supplied to the traps daily. He believed that to secure the best protection, all plumbing fixtures should be placed in an "annex" to the dwelling. Not a few of our lately constructed and most elegant mansions had not an inch of plumbing in those portions usually occupied by the family, he said. Another concession that civilization must make was, that we return to the open fireplace—"the best ventilators ever invented"—as a means of warming our dwellings.

Sanitary engineers were no doubt performing a much-needed and very useful service, but there was no evidence that up to the present day they had done anything more than investigate the evils they had been asked to remove.

At the close of the paper, Professor Doremus showed the Academy the results of experiments to prove that sewer gases—as ammonia and sulphuretted hydrogen—easily pass through water traps. He had before them several glass traps, prepared beforehand, in which the different gases were stated to have passed through the water and shown the proper reaction on paper in the other side of the tube (which appeared to be closed, though that was not stated). He also believed that the only means of protection was by the use of chemicals in the traps. He recommended manganate of soda and sulphate of magnesia, which, when mixed, gave off ozone, the great purifier. These should be supplied to water-closet traps every time they were used, by a mechanical contrivance.

Dr. John S. Billings, U. S. A., upon being called on by the president, spoke at some length upon the subject of "House Sanitation in Large Cities." He said he took a more cheerful view of the situation, and of the power of sanitary engineering to prevent danger, than was done by the author of the paper.

Referring to Prof. Doremus's experiments, he said that they did not prove anything as regards the passage of sewer gases through traps of water-closets connected with a properly arranged soil pipe. The gas in Prof. Doremus's flasks is almost pure, and the amount of water in the half-inch glass tube is very small and soon saturated.

In the soil pipe the offensive gases are greatly diluted with air, and the very careful experiments of Dr. Carmichael of Glasgow, made with an ordinary water-closet and soil pipe which had been used for a long time, showed conclusively that the amount of gases which pass through a water trap from a ventilated soil pipe is so extremely minute that it can only be detected by the most delicate test, and is so diluted with air that it is not dangerous to health. The difference in the effect of dilution upon gases and upon germs was pointed out.

There is no such thing as a sewer gas of peculiar and definite composition. Sewers contain various kinds of gases, in constantly varying proportions. These gases do not produce specific contagious diseases, such as diphtheria, scarlet fever, or typhoid fever.

It is not, however, correct to say that they produce no disease and are never dangerous. When not diluted they tend to produce debility, loss of appetite, headache, nervous prostration, etc., and to dispose the system to be affected by the true immediate or specific causes of disease. But when sufficiently dilute they are not dangerous, and this dilution can be secured, so far as the house is concerned, by thorough ventilation of the soil pipe, provided that the communication between the sewer and the soil pipe be cut off by a trap and fresh-air inlet. Under such conditions the proportion of offensive and dangerous gases in the soil pipe is very small, and the amount absorbed by the water in the closet traps is almost inappreciable.

The case is somewhat different as regards the minute particles or germs contained in sewer air, at least under certain circumstances.

It is true that, as yet, we are not able to speak positively as to these supposed germs. We can only act upon probabilities, but in speaking to an audience of physicians I feel sure they will appreciate this, for they have to act on probabilities only in every case they treat.

Now it is highly probable that what are known as the specific contagious diseases are not produced by gases arising from the decomposition of vegetable or animal matters, or of excreta, but from minute living particles or organisms, produced from other similar particles or organisms.

If diphtheria, scarlet fever, or typhoid fever could be produced by combinations of filth, moisture, and temperature, it is impossible to explain why these diseases do not constantly prevail in some cities in India, China, etc.; nor upon this theory is it possible to explain why they are more prevalent now than they were fifty years ago.

Now the danger to health from these germs cannot be entirely removed by dilution. If the virus of sheep-pox or of vaccine be diluted until not more than one inoculation out of fifty takes effect, it will still be found that when it does take, the effect is the same as if pure virus had been used.

Does the water trap prevent the passage of these germs?

The experiments of Dr. Carmichael show that it does, and that an organic putrescible fluid will remain unchanged when exposed only to the air immediately above such a trap. A pin-hole in the soil pipe is far more dangerous than a trap.

From these experiments, as well as from those of Wernich, Pumpelly, and others, I think that the estimate of the dangers of house drainage has been placed much too high. The real difficulty seems to me to be, not that the resources of sanitary science and engineering are not sufficient to secure safe plumbing, but that the people at large who are willing and able to pay for good work do not know to whom to apply to get it.

In this matter physicians are the natural advisers and leaders, and it is very satisfactory to find that they are investigating the subject. I would only urge upon them to go cautiously, and not to rush into extremes. There are a few competent advisers, and some skillful and honest plumbers; and the physician should know who these are and where they are to be found.

At the conclusion of Dr. Billings's remarks, Dr. E. G. Janeway said that specific disease germs would not pass through a water trap; so far as scarlet fever was concerned, he had never seen a case that he thought could possibly have come from the sewer, and he challenged any one present to tell him of a case.—*Sanitary Engineer.*

Chicago's Experiment.

Occasional mishaps in the shape of ruptured cable and temporary troubles with the grip cars cause more or less comment and annoyance in the working of the cable system in this city. In the case of "broken cable" the fault rests as yet entirely with inexperienced grip hands, and it is only a matter of time when trouble from this cause must to the greatest extent cease. We think, however, that street cable railway companies will do well, judging from what we see and hear in this city, to procure the best kind of intelligent help in running the grip cars, as it will certainly prove in the long run the most economical course. The breaking of the cable in itself is a matter of no great cost, but the loss by temporary stoppage of traffic and the expenses incurred in reinstating horse service for the time being would surely compensate for the excess in cost between common and skilled help. We have before stated that the question of turning corners might prove a hard one to solve. This is being proved, notwithstanding the reports of successes which we have published. We hear that the cable now turning the corners is wearing badly, and that a strand in it frequently gives out. It is yet an unsolved problem, this turning of corners by wire cable traction, and will yet necessitate much mechanical ingenuity to economically overcome the varied opposing elements to a successful issue.—*The American Engineer.*

American versus English Nailmakers.

Foreign competition in this branch is relaxed by the action of the American nailmakers, who have advanced prices from 15c. to 20c. per keg. These advanced rates, which are much above those demanded by English makers, have of course greatly improved the chances of English nails in Canada, Australia, and other neutral markets, though many even of our own colonists appear to be strongly biased still in favor of the American article, owing to its greater uniformity of quality. It is not denied that English manufacturers can produce as good or even a better nail than the Americans, but they do not always do so; and the merchants who conduct the trade are apt, in buying, to sacrifice higher considerations to cheapness. The Americans are wiser in their generation, and, frankly recognizing the impossibility of competing with English makers in cheapness, they strive to excel in quality, uniformity, and excellence of patterns. On the whole, these tactics have been of great service to them, and have given them a footing in many markets from which it will be no easy matter to dislodge them.—*Scientific American.*

Traveling Expenses.

The question and answer found in the following extract will no doubt be of much interest to the architects on this coast. It is a question that has been asked us several times, but we have deferred publishing an answer until the new by-laws of the Pacific Coast Association have been perfected. Some provision, no doubt, will be made in the new Code for just such emergencies as mentioned by the correspondent.

"To the Editors of the American Architect:

"*Dear Sirs*—Will you be so kind as to inform me in your next issue the customary practice of the profession in the following or similar cases? When an architect is engaged to design and superintend the erection of any building situated any distance from the city where he resides and practices, whether it is 5 or 500 miles, and agrees to be compensated according to the schedule of prices set forth by the American Institute of Architects, is he or is he not entitled to charge the cost of traveling expenses; also for time spent in travel in excess of the 5 per cent.?

"Again, when the client, for reasons of his own, employs a superintendent subject to architect's orders, is not the architect entitled to 5 per cent. for full professional services, when no agreement for less than 5 per cent. was made in consequence of employment of superintendent, although the fact of the competency of the superintendent renders the frequency of the architect's visits not as necessary as if there had been no superintendent employed? C.

"[The custom among architects everywhere is to charge for actual traveling expenses in addition to their regular commission. An additional charge for time spent in traveling to work at a distance is very often made by previous agreement of the parties, but is, we think, left by the schedule for settlement in that way, instead of according to any fixed rule.

"The architect's compensation is always understood to be exclusive of the salary of a clerk of the works, or local superintendent, who is, or should be, employed by the client in every important construction, to watch the details of the work under the direction of the architect.—Eds. American Architect.]"

The Late Mr. G. E. Street, R. A.

Mr. George Edmund Street was born at Woodford, Essex, in 1824, and educated at the Collegiate School, Camberwell. His architectural studies were begun under Mr. Owen Carter, at Winchester, and completed under the late Sir George Gilbert Scott, with whom he remained five years. Like his master, Mr. Street adopted the Gothic style in the buildings he designed, and the numerous essays and lectures which he has written upon architecture have all been directed to illustrate the history and principles and promote the progress of that style. His principal literary efforts are "The Brick and Marble Architecture of North Italy in the Middle Ages," 1855; and "Some Account of Gothic Architecture in Spain," 1865. Mr. Street has for many years been largely engaged in the work of erecting and restoring churches and other ecclesiastical buildings all over the country. To mention only the most prominent among his architectural works, he was the architect of the Cuddesden Theological College, of the new chapel and school rooms of Uppingham College, and of new churches at Bournemouth, Garden street, Westminister; St. Philip and St. James's, Oxford; St. John's, Torquay; All Saints', Clifton; St. Saviour's, Eastbourne; St. Margaret's, Liverpool; and St. Mary Magdalen, Paddington. Among his restorations may be noticed the churches of Eccleshall, Wantage, Uffington, in Berks, and Stone, in Kent, and Jesus College Chapel, Oxford. He was also the architect of the Earl of Crawford and Balcarres' house at Dunecht. Perhaps his most considerable work in church building was the erection of then ave of Bristol Cathedral in the Early English style. He was engaged upon the restoration of the nave and building of a new choir in Christ Church Cathedral, Dublin, and on building a new synod-house in connection with the Cathedral for the Irish Church. But in London Mr. Street's reputation will mainly rest upon the Royal Courts of Justice in the Strand, now approaching completion. He was appointed architect for this gigantic undertaking in 1868, after a competition in which the most famous architects of the day, including Sir Gilbert Scott and Mr. E. M. Barry, took part. Although a great deal still requires to be done before the interior of the building is finished, the outer shell is fairly complete, and the public are able to judge of the imposing effect which the New Law Courts will present as they are approached from the Strand. Mr. Street was appointed in 1850 diocesan architect to the diocese of Oxford, and he subsequently filled similar posts in the dioceses of York, Ripon, and Winchester. He was a Fellow of the Institute of Architects, of which he has been Vice-President, and a Fellow of the Society of Antiquaries and of other societies. In 1866 he was elected an Associate of the Royal Academy, and was advanced to be a Royal Academician on June 29th, 1871. He was also a member of the Imperial and Royal Academy of the Fine Arts at Vienna, and a Knight of the Legion of Honor.—*London News.*

Tinkering.

An unfortunate weakness of some in charge of machinery is a desire to be constantly tinkering at it, under the mistaken impression that they are improving its performance. The reverse is the truth oftener than otherwise. With new engines and machines, it sometimes happens that the parts chafe a little through some oversight in fitting up, and require to be eased; but when it comes to resetting valves and general overhauling, though there may be instances where it is required, in most cases it is a mistake to attempt it.

Here and there, perhaps, a little slide-valve engine has been set cold, so that when it gets to work hot, the valve does not work properly; but most automatic engines, we might doubtless say all, have been correctly set by the indicator before being out of the shop, and no one can correct their performance by merely guessing at what is going on in the cylinder, and assuming that the performance can be improved by shifting the eccentrics hap-hazard.

Engines which require the fewest repairs are those that have had the least tinkering done upon them; and that, as a rule, applies all over. It is the same in the machine shop; some are eternally on bad terms with their lathes, or shapers, or planers. We recall one man who was so often upon his knees about his lathe, and had so many quarrels with its performance, that he gained a nickname, which stood in lieu of his proper one; and after all his fussing with his lead-screw, and feed-gear, and cone-pulley, and bearings, he did the poorest work in the shop. Perhaps because he was a tinker.

It is a good thing to know when a machine is in order, and to keep it so; in other words, "let well enough alone."—*The Wood-Worker.*

Steel Square Problems.

A new work explaining the uses of the Steel Square. Sent post-paid to any address upon receipt of 50 cents.

Market Reports.

Lumber.—A very brisk demand, with stiff prices, and bright future prospects, exactly express the state of the lumber market. A false report was circulated among the contractors that an advance in lumber had been made, but there was no foundation whatever for the rumor.

Receipts since January 1st, 1882:

Lumber	41,871,376
Shingles	9 099,760
Laths	4,907,350

A correct price list of lumber will be found below:

Pine.

Common Rough, up to 40 feet, per M feet	$22 50
" 41 to 50 " "	23 50
" 51 to 60 " "	24 50
" 61 to 70 " "	26 50
" 71 to 80 " "	28 50
Refuse Rough	18 50
Common Rough, sized with planer $2 additional on above rates, per M feet.	
No. 1 Flooring, 6 inches and over, "	32 50
" 4 " and under, and 1¼x4 and 1¼x6	
Flooring and Stepping	35 00
Rough Clear for Flooring, $1 less than above rates.	
Second quality Flooring and Stepping ... per M feet	27 50

Nails and Hardware.—Some of the articles in most general use have had a sharp advance during the past month. This is particularly noticeable in the price of locks. Nails remain the same.

Nails.—Remain the same as last month. Since January 1st, 1882, we have imported 52,106 kegs.

10 to 60 pennies, are quoted at	$4 25
8 " "	4 50
6 " "	4 75
5 and 4 " "	5 25
4 and 5 pennies, brad heads, at	5 50
6 " "	5 75
8 " "	6 00
10 and upward "	5 25
3 penny fines "	7 75

Paints.—A new company has made its appearance, introducing the Omaha White Lead. With the large demand that is confidently expected this year, the agents should be able to control a fair amount of patronage.

The PIONEER brand has been successfully introduced into every town and hamlet on the Pacific coast, and has given universal satisfaction. We quote price at 8 cts. per lb.

The value of the lumber cut yearly on the Pacific coast, at the rate of $10 per 1,000 ft. at the port or place of shipment, is $6,000,000, says the *North-western Lumberman.* A thousand years would not suffice to exhaust the giant woodlands extending from Alaska to Santa Cruz, so that on a very rough estimate this portion of the resources of the Pacific slope is worth at least $6,000,000,000.

The Boston *Transcript* says that an East Boston lady was recently requested by the board of health to have traps placed under the sinks and basins in her house, and when an inspector a few days later examined the premises, it was found that she had placed there several rat-traps.

☞ **Subscription price of this journal is $2.00 in advance.**

Building Intelligence.

With this month the building season of 1882 may be said to have been busily begun. We hope the present activity may continue during all the summer months. This can hardly be expected, however, as the high prices of materials and labor, seriously affect the building of houses for tenement purposes. We know of several jobs after being figured upon, were given up, as the lowest bids offered would not justify the property owners to build, owing to the high prices of lumber, hardware, etc. It will be observed that there are more houses reported that are intended for better class of dwellings than we have been able to chronicle for some time past.

It has always been the aim and object of the managers of this journal to present to its readers as full and as complete a report of buildings being erected as it was possible to obtain both in city and country. To secure information from the interior, it has been our custom to forward to responsible parties each month a blank circular, which, upon being returned to us with the blanks filled out with the necessary information, enabled us to give to our readers news from different parts of the country. We are glad to state that this system will soon be superseded by a much improved plan, the working of which will be seen after this issue in the number of buildings reported from the country.

In our last, one of those *smart* (?) men who no doubt earn their living by not obeying a certain commandment, managed to get hold of one of our blanks, and filled it out in a manner best suited to his illiterate taste. We refer to the item in our last from the town of Woodland. The report given was incorrect in every particular, no such building by such parties as were mentioned being even contemplated. We thank Bro. Saunders, of the Woodland *Democrat*, for his kindness in publishing the card we sent to him, explaining the appearance of the article in this journal. A card in connection with this matter will be found in another part of this issue.

SAN FRANCISCO.

Bush street between Montgomery and Kearney, four-story and basement brick building. Owner, Mrs. Barbara Suter; architect, H. Geilfuss; contractors, Conrad and Miller; cost, $35,000.

Two-story frame dwelling, brick basement, on northeast corner of Buchanan and Jackson. Owner, Mrs. Lemmon; architect, W. Cleaveland; contractor, —— Munns; cost, $12,000.

Southwest corner of Laguna and Sacramento. Two-story frame dwelling with basement. Owner, J. C. Reis; architects, Schmidt & Havens; contractor, C. Chrisholm; cost, $19,000.

North side Golden Gate Avenue between Van Ness and Franklin, double two-story and basement frame dwelling. Owner, H. Frazer; architect, Schmidt; contractor, Langstaff; cost, $7,000.

Three-story frame building on northwest corner Larkin and Grove. Owner, —— Klinecklaus; architects, Kentzer & Raun; contractor, F. Klatt; cost, $8,000.

One-story and basement brick addition to building No. 31 Market street. Owner, M. J. O'Connor; architect, P. Huerne; brick work, O. E. Brady; carpenter work, —— McCready; cost, $4,050.

Two-story frame building on corner of Twenty-fourth and Valencia. Owner, P. Schenckel; architect, —— Apponyi; contractor, Dryer; cost, $9,640.

Three-story brick building with basement on Bryant street near Eighth. Owners, Spivalo & Forman; contractor, J. Grant; cost, $15,000.

Two-story frame dwelling on Beaver street. Owner, Rev. Dr. Beckwith; architect, Chas. Geddes; contractor, R. B. Hicks; cost, $4,000.

Repairs and remodeling building corner Drumm and Oregon streets. Owner, S. C. Hastings; day's work; cost, $4000.

Two-story frame dwelling on south side of O'Farrell between Jones and Taylor. Owner, H. Schmidt; contractor, —— James; cost, $3,000.

Two-story frame building, brick foundation, on southwest corner McAllister and Buchanan. Owner, T. Juncker; architect, —— Bayless; contractor, J. T. O'Brien; cost, $5,000.

North side Fell between Octavia and Laguna streets, two-story and basement frame dwelling. Owner, W. Hewe; architect, W. Winterhalter; contractor, W. Hewe; cost, $3,000.

Two-story frame building on Hayes street near Gough. Owner, Mrs. Kalzee; architect, W. Schroepfer; contractor, H. Meyn; cost, $9,000.

Two three-story frame dwellings on north side Fell between Franklin and Gough streets. Owner, T. Sullivan; architects, Schmidt & Havens; contractor, J. Furness; cost, $11,000.

Two-story and basement frame dwelling on southeast corner of Post and Octavia. Owner, —— Anspacher; architect, C. Geddes; contractor, R. Hicks; cost,

Two-story frame dwelling on south side Geary between Octavia and Laguna streets. Owner, Mrs. Josephs; architects, Schmidt & Havens; contractors, Waterbury & Maxwell; cost, $4,100.

Two-story and basement frame dwelling, brick foundation, on south side Geary between Webster and Fillmore; Owner, D. Cole; contractor, —— Fish; cost, $10,000.

Two-story and attic frame dwelling on east side Scott between California and Sacramento streets. Owner, Mr. Norwood; architect, J. Marquis; contractor, W. M. Fletcher; cost, $6,000.

Three-story frame dwelling on south side of Pine near Scott street. Owner, —— Lewis; contractor, —— Pluns; cost, $4,500.

Two-story frame dwelling on southeast corner of Pacific and Fillmore. Owner, G. E. Ludington; architects, Percy & Hamilton; contractor, —— Jackson; $5,000.

Two-story frame dwelling on Geary street between Octavia and Lguna. Owner, ——; architects, Schmidt & Havens; contractors, Waterbury & Maxwell; cost, $5,000.

Three-story frame dwelling on corner of Gough and Bush. Owner, J. E. Ruggles; architect,—— Smith; contractor, —— Sanchez; cost, $7,000.

Two-story frame dwelling on northeast corner Pacific avenue and Scott street. Owner, Capt. Williams; contractor, —— Treadwell; architect, —— Smith; cost, $4,500.

Additions to building on Beale street between Mission and Howard. Owner, J. R. Sims; contractor, Thos. Day; cost, $2,200.

Alterations to building corner Fourth and Clara streets. Owner, —— Marron; architect, T. J. Welsh; contractors, McCann & Jeffars; cost, $2,000.

Two one-story and basement frame dwellings on Church street between Twenty-eighth and Twenty-ninth. Owner, and builder, R. Bergfeld; cost respectively, $1,200 and $1,700.

One-story frame dwelling on Dore street between Harrison and Bryant. Owner, P. Birch; architect, J. T. Kidd; contractor, T. Sullivan; cost, $800.

Two-story frame tenement on Central Avenue between Bush and Sutter. Owner and builder, D. F. McGraw; cost, $2,400.

One-story frame building on Sutter street, near Broderick. Owner, Maggie McKee; contractor, —— McKee; cost, $2,700.

Two-story frame building on southeast corner of Pine and Fillmore streets. Owner, —— Schoenfeld; architect, W. Winterhalter; contractor, F. Crowley; cost, $6,0 0.

Repairs and alterations to building on south side of California near Fillmore. Owner, F. Wittram; contractor, —— Jackson; cost, $2,500.

Repairs to buil ling on Webster street between Bush and Pine. Owner, Mrs. Phillips; day's work.

Five frame dwellings on northeast corner of Ellis and Laguna streets. Owner, H. Hinkle; day's work.

One-story frame dwelling on Broderick between California and Sacramento streets. Contractor, —— Pluns; cost, $1,000.

Additions to building on Baker between Sutter and Post streets. Owner, W. Ellard.

Two-story frame dwelling on Buchanan street near Golden Gate Avenue. Owner and builder, —— Cram; cost, $1,500.

Repairs to building on Hayes street near Laguna. Owner, Gallagher; day's work.

Repairs on building corner Jackson and Leavenworth street. Owner, ——, Brawling; contractor, J. T. Blake; cost, $900.

Three two-story frame dwellings on east side of Fillmore between Washington and Jackson streets. Owner, J. F. Fortmann; day's work; cost, $7,500.

One-story frame building at Black Point, for the Phelps Manufacturing Company. Day's work.

One story frame dwelling on northeast corner of Filbert and Buchanan streets. Owner, Jas. Sudden; contractor, Frichette; cost, $1,500.

Repairs to two-story frame on north side Ellis between Taylor and Jones streets. Owner, W. O. Davis; contractor, J. Grant; cost, $1,100.

Repairs to dwelling on Leavenworth between Green and Union streets. Owner, L. Waddams; contractor, W. Simon; cost, $1,500.

Alterations and repairs to building corner of Jackson and Larkin streets. Owner, H. Pierce; architect, Ed. Swain; contractor, A. Flood; cost, $4,000.

Alterations to building 1216 Geary street. Owner, J. Kahn; architect, —— Blum; contractor, A. Flood; cost, $5,000.

Repairs to dwelling on Post street between Powell and Mason. Owner, Mr. Frank; architects, Schmidt & Havens; contractor, A. Norton.

Repairs and additions to building junction of Vallejo and Montgomery Avenue. Owner, Mr. Boem; day's work; cost about $2,500.

Two-story frame on Pacific street between Sansome and Battery. Owner, G. Costa; day's work; cost, $1,000.

Repairs to building junction of Market and Oak streets. Owner, D. Nightingale.

One-story frame on Nineteenth near Castro street. Owner, Mrs. Lyons; contractor, —— McInnerny; cost, $700.

One-story frame on Douglass near Seventeenth street. Owner, M. Meibach; contractor, E. Ehrmann; cost, $900.

Four one-story and basement frame dwellings on Fifteenth near Dolores street. Owner, Mrs. Thompson; day's work; cost, $3,000.

Two-story and basement frame dwelling on Valencia near Sixteenth street. Owner, Chas. Welsh; day's work; cost about $3,700.

Repairs and additions in rear 1058 Howard street. Owner, —— Ross; contractors, S. G. Happ & Co.; cost, $1,100.

One-story and basement frame dwelling on Jessie street between Seventeenth and Eighteenth. Owner, Miss E. Donahue; contractor, M. D. Killelea; cost, $1,250.

Repairs to dwelling on Jessie between Eighteenth and Nineteenth streets. Owner, Mr. Kennedy; day's work; cost, about $600.

Repairs to Pacific Oakum Factory on corner of Eighteenth and Harrison. Owner, S. F. Weeks & Co.; day's work; cost about $1,000.

Repairs and alterations to frame building on Howard street near Nineteenth. Owner, F. Gailhouse; contractor, S. M. Hills; cost, $2,000.

Two-story frame dwelling on Twenty-fourth street near San Jose Avenue. Owner, G. Edwards; contractor, —— Cs man; cost, $2,000.

One-story frame building on west side Treat Avenue between Twenty-fourth and Twenty-fifth streets. Owner, Jos. Cantor; contractor, —— Downey; cost, $1,000.

One-story frame on Alabama near Twenty-sixth street. Owner, W. Dunn; contractor, J. Nelson; cost, $800.

Two-story frame on Harrison between Twenty-fifth and Twenty-sixth streets. Owner, W. T. Garratt; contractor, L. H. Nolte; cost, $2,500.

Two-story frame building on Mission and Twenty-ninth streets. Owner, J. Bergstrom; contractor, P. J. Smith; architect, —— Smith; cost, $1,000.

Repairs to frame dwelling on Harrison and Park Avenue. Owner, H. Hugg; contractor, —— Tildon; cost, $800.

Two-story and basement brick building on north side of Post street between Dupont and Stockton. Owner, J. Apel; architect, Hoffmann; cost about $20,000.

Two-story frame dwelling on north side Geary between Fillmore and Steiner streets. Owner, Robt. White; architect, H. T. Bestor; contractor, A. Jackson; cost, $5,000.

Repairs to M. E. Church on Powell near Pacific street. day's work; cost about $3,000.

Alterations to building on Green street near Mason. Owner, P. Marsicano; architect, Hillert; contractor, Classen; cost, $1,500.

Alterations to building on Turk and Polk streets. Owner, C. Mangels; architect, H. Geilfuss; contractors, Conrad & Miller; cost about $1,000.

Two-story and basement frame dwelling on Jones near Ellis street. Owner, A. W. Baldwin; architect, H. Geilfuss; contractor, S. Grant; cost, $4,500.

California between Laguna and Buchanan two-story frame and basement. Owner, Mrs. J. Newgas; architects, Newsom Bros.; contractors, Knight & Littlefield; cost, ——.

Vault in Masonic Cemetery. Owner, Mrs. A. Mau; architects, Moore & Whittemore; contractors, Matthews, McGrath & Cox; cost, ——.

SAN LUIS OBISPO.

The bank is putting in large vaults. Architect, H. D. Mitchell; contractor, Neaglee; cost, $1,500.

ALAMEDA.

One-story cottage on Pearl street. Owner, L. A. McDermith; contractor, Bones; cost, $2,200.

One-story cottage on Railroad Avenue, near Chapin street. Owner, G. Hart; cost, $2,500.

One-story cottage on Alameda Avenue, near Willow. Owner, Mrs. Joyce.

FRESNO.

One-story frame building on Mariposa street. Owner, E. Wimmer; contractor, —— Bohunin; cost, $2,500.

Two-story frame dwelling on I street. Owner, C. A. Munn; contractor, J. Lee; cost, $2,500.

RIVERSIDE.

The Congregational Society are erecting a church in the Redlands near town. Cost about $2,500.

Frame dwelling and barn. Owners, Judson & Brown; contractor, A. W. Boggs.

NAPA.

Additions to the Odd Fellows' Building. Cantractor, J. Cox; cost, about $6,000.

ANAHEIM.

Two-story brick building. Owner, B. Dreyfuss & Co.; cost, $10,000.

From Kentucky to Florida stretches a nearly continuous forest, which has scarcely been touched by the lumbermen.

The First Chapter of the American Institute of Architects West of the Rocky Mountains.

At the last meeting of the Pacific Coast Association of Architects, it was decided to change the name and character of the old organization, by making it a Chapter of the American Institute of Architects. A Constitutlon and By-Laws had been carefully prepared, and were read *ad seriatim*. Printed copies were ordered to be ready in time for the next special meeting, April 12th. This journal will be in print by that time, so we cannot give a report until our June issue, when we will present the Constitution and By-Laws in full.

We bid farewell to the old Association, and extend a cordial greeting to San Francisco Chapter of the American Institute of Architects, by which name, in future, the old organization will be known.

Our New Heading.

After a greater delay than was anticipated at first announcement, we present in this issue the new design for the heading of this journal. As to its merits in design and artistic execution, we await the criticisms of our readers and contemporaries.

To us it possesses a value far beyond its intrinsic qualities, in the fact that it is the generous, voluntary bestowal of the *Pacific Coast Association of Architects*, now known as the SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

For the purpose of inducing our draughtsmen to become more proficient in originality of designs and skillful in execution thereof, the P. C. Association of Architects (at that time called) offered two premiums of $25 and $15 for the best two designs for a heading or frontispiece for this journal. It was generally understood by the Association and all parties interested, that *originality* was to be one of the main features. Seven designs were presented, and were referred to a special committee. The committee in their report decided that the drawings were not such as contemplated, and so called for new designs. Twenty dollars was added to the premiums, and three months time was given to present them.

At the meeting on April I, four designs were presented on the second competitive set. The parties competing were A. T. Matthews, Oliver Everett, Vesta Schallenberger, and W. Schrof. Prizes were awarded to the first three in the order named: 1st prize, $30; 2nd prize, $20; 3rd prize, $10.

We congratulate Mr. Matthews upon his success in producing a design so meritorious in character as to win the first preminm. A still further source of pride to him lies in the fact that this is the first competitive inducement that has been presented to the students and draughtsmen in the profession on this Coast. In competitions of this character, where the judges are so well qualified by practical experience in the determination of awards as were the committee into whose hands this matter was specially intrusted, and the Association as a whole, before which the designs were laid prior to any action on the part of the committee, the result as given by them must always be gratifying to all parties interested; and we hope that in future contests our young draughtsmen will strive in their efforts to outrival those in the East. This they can do, but study and strict application are necessary before they can arrive at the high standard necessary.

We regret that the party presenting the second design did not take more time in working out a truly good conception. It received many very complimentary remarks, and had our young friend bestowed the proper amount of care and time upon the study and execution of his *truly original*, his chances for the first premium would have been materially increased. We say in all kindness to the young men in the profession, that success upon merit is a timid bird, unless the degree of merit is very positive. When the contest is close, a single irregular line, a slur, or an innocent blot may turn the issue.

The third design was presented by quite a young student. It is the intention to present to our readers and the public generally the designs as they were handed in to the Association, so that all may judge of their respective merits. By so doing, it will enable those competing to notice in what manner they could have improved their designs, and thus be of much practical value to them.

After Many Years.

With this issue the CALIFORNIA ARCHITECT AND BUILDING NEWS enters upon a new era of prosperity. Far different is the outlook now from what it was in the dark and dull times when this journal was first started. THEN, predictions as to the number of months which we would publish the NEWS were freely discussed on the corner, and generally among the mechanics.

Now, we can truly point to our journal as an example of what determination and energy will do. At the outset, neither of the editors connected with the publication of this representative organ of the profession enjoyed the least practical knowledge of the necessities and responsibilities that were required to make a success of a journal of this character. We are more than pleased with the success of our efforts.

We can justly point with pride to the

HIGH STANDARD

of our advertising columns. The first firms in the city and State are represented. Eastern inventors and material-men are beginning to find out that the best way to reach the great mass of the consumers of their various commodities is to put an advertisement in this journal. Those that have done so have reaped a rich reward, as is easily proved by their keeping their "ads" in permanently. Some of them having already favored us for more than a year. This they most certainly would not have done unless they had reaped a

GOLDEN HARVEST

for their outlay.

It is the aim and object of the editors to make this an influential journal, and a source of valuable information to architects, contractors, mechanics, and others. Strenuous efforts will be made in each number to have it a little better than its predecessor. This we can easily accomplish, but our friends must help us; this they can do by coming forward and help swell our subscription list. We want and we intend to have at least

TEN THOUSAND

paying subscribers. Measures will keep pace with the means, and the faster and more freely the latter come to hand, the more vigorous will be the former.

Measuring Dressed Lumber.

A planing-mill owner in the South submits the following: "Please state through the columns of your valuable journal the rules or customary ways of measuring flooring and ceiling as it goes to the planer. Namely, if a board is six inches wide and twelve feet long, would it be measured as having six feet of contents when it comes from the machine? Again: if a board be twelve feet long and six inches wide as sawed, but so crooked upon its edges that an inch in the width must be lost in dressing, would it be measured as six feet, or as but five, when dressed? In other words, will you give us the customary rules for measuring dressed and matched ceiling and flooring?"

Lumber passing through a machine is measured as though in the rough. A six-inch strip of course loses in its width by dressing, but it is customary to call it six-inch strip still when computing it for measurement and sale. Before the days of machine dressing, a purchaser bought his lumber in the rough and handed it over to his carpenter to prepare for laying on the floor. He did not ask the manufacturer to sell it to him for what it would absolutely measure when dressed, neither did he expect the carpenter to pay for the decrease caused by dressing. This was a loss which was as much a contingent necessity as was the loss of ends or widths in boards which must need be cut to fill a certain place in the work. It was a loss which was figured for in the estimated cost of the material needed for the building. The introduction of machinery did not shift the responsibility of this

loss; it simply provided for doing more cheaply and efficiently the labor which had hitherto been done by hand. The loss remains the same, and upon the same party. Hence no change in the custom of measuring took place on the introduction of machine dressing.

The second proposition of our correspondent, however, introduces a different element. If a board is crooked it must be measured straight, if entitled to measurement in the grade for which it was intended. Usually crooked lumber loses in grade, but if passed, can be measured only for what it will make. If it is a wedge strip, it is to be measured at its narrow end, for it can only make so wide a piece of flooring as can be manufactured with parallel lines. If it is crooked so that an inch is lost in making it straight, the loss falls on the manufacturer at the sawmill, not upon the planing-mill, and only to the reasonable extent of ordinary loss in dressing upon the purchaser of the planed lumber. Such a strip as our correspondent describes should be measured at five inches in the rough, and would be considered as a piece of five-inch flooring when matched and dressed. This rule holds good in all markets of which we have knowledge.—*Ex.*

Pacific Coast Association of Architects.

The regular monthly meeting of the above Association was held in the rooms of the Art Association, Friday evening, May 5th.

Committee on the first competition designs reported progress, as it is their intention to present a very complete report, so that the students and draughtsmen engaged in the struggle may understand their shortcomings and be prepared to enter future contests with more determination to excel.

The Constitution and By-Laws were presented to the Association for approval. After being read and discussed *ad seriatim*, the Secretary was ordered to have fifty copies printed and distributed to the members, so that they will be fully prepared to discuss them at the nextmeeting.

After a spirited debate, the first section was unanimously adopted. By this act the Pacific Coast Association of Architects is merged into the SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS, being the first Chapter instituted this side of the Rocky Mountains.

A vote of thanks was tendered the committee who had so ably performed the arduous task of preparing a complete Constitution and By-Laws.

A committee of three was appointed to nominate officers for the ensuing term. Said committee consists of Messrs. Curlett, Wolfe, Sr., and Moore.

A special meeting was ordered called for the purpose of receiving and acting, if need be, upon the report of the above committee, and also to further consider any unfinished business.

NIGHT OF MEETING, MAY 12TH, AT 7.45 P. M.

Secretary was authorized to visit members in arrears, and request them to be present at the next meeting.

Premiums were ordered paid to the successful contestants in the second competition for new heading of the CALIFORNIA ARCHITECT AND BUILDING NEWS.

Besides its uses for adulterating other oils, as a substitute for animal fats in culinary purposes and as a lubricant, the cotton seed oil is now coming into use as an illuminator, said to be superior to lard oil, making a pure white light and emitting no smoke. As far as the test has gone, it is especially useful for mining purposes, as it will not congeal as quickly as the lard oil.

The Redwood of California.

There are many things connected with the location of the redwood that have been a source of deep study amongst our scientists. Why should the trees only be found along the California fog belt? Why is it that in ravines opening towards the ocean, exposed to the fogs, the bottom should be covered with a heavy growth of redwood timber, and as we ascend up the steep mountain-sides the redwood gradually diminishes in size and number, until it is lost to our view on account of its place being taken by the pine and a thick undergrowth of various woods. We have personally noticed this fact, that in the bottom of the ravines we find the redwoods fully developed, but disappear almost entirely on the summits of the various mountain ranges. Fog seems to be as absolutely essential to the redwood as the sun is necessary to flowers.

It must not be supposed by our readers that our immense forests of redwoods do not contain any other kind of timber. Fir, pine, and spruce are liberally sandwiched amongst the redwood. This may or may not be advantageous to the millman. When the loggers and choppers start out to their work, they generally make a clean sweep as they go. Pine or redwood, the path is made clear. But when the logs get to the mills, they have to be assorted. The sharp, full-swedged teeth of the saws that cut their way with so much velocity through the soft redwood will not do for the hard flint knots of the pine, and so when a supply of pine logs are on hand, the teeth of the saws are generally changed.

One immense advantage the redwood has over the timber in forests in the Eastern and Western States, is its size. We have seen trees standing so close together that a man on horseback would find much difficulty in getting between them. Many of them will not have even the smallest branch for at least one hundred feet from the ground. We have frequently seen trees cut into logs, that would make in lumber at the mill over 100,000 feet. Logs at the mills on Humboldt Bay will average over seven feet in diameter. Twelve and fifteen feet diameter is very common for logs, although when they are of that size they are halved or quartered by blasting. One of the largest and finest churches in the city of Santa Rosa is built completely from lumber obtained from one tree; even the shingles were made from bolts obtained from the same source. Speaking about knots, the meanest of them all is a hard, flinty, dry, redwood knot. If our Eastern friends do not think so, let them take a dry redwood board with one of the above-described knots. Let him have a nice sharp saw, and just as he gets near a knot, let him give a little extra hard push so as to get through quick; take our word for it, a surprise will be in store for the man with the saw, for he will actually think a "*blizzard*" has struck a sand dune, and deposited the contents of it in his eyes and down his back. And then let him examine his saw, even if it is SPAULDING'S best. (Our friends of the Pacific Saw Works in this City thoroughly understand this knotty subject, and the temper of their saws is such that even a hard redwood knot is successfully cut by their saws.)

We will feel indebted to any one of our Eastern readers who will forward to us the proportion between rough and clear timber that is obtained from logs in the forests of Maine and Michigan. In redwood the proportion varies. In the more northern counties, as Del Norte and Humboldt, the average of clear lumber in a tree is over 50 per cent.; in Mendocino it is a little less than 50 per cent.; while in Sonoma it is only about 25 per cent.

An erroneous impression prevails amongst some of our subscribers in regard to the reproductive power of the redwood. When a tree has been cut down, shoots will soon make their appearance, which in a few years grow to considerable dimensions. Now, in all earnestness, we think there ought to be a law to protect these young shoots of future grants, and a very stringent one at that. No immediate fear of this generation using all the redwood timber in sight, but the important problem is presented to us of forests completely denuded of their timber in the course of the next sixty or seventy years, and how shall we reforest them?

We earnestly call upon our law makers to devise laws that will stop such acts of vandalism as the following: A man had a nice clearing on one of the bottoms of a river in Humboldt County. It was observed that for a few months of the year the sun was hid from the bottom by a line of tall trees on the ridge of the mountains above. Hiring a few men, as wages was very low at that time, the trees were so thinned out on the ridge that the sun shone resplendently on the "clearing" a few hours more each day, thus enhancing the value of the land at a sacrifice of thousands of feet of lumber.

On the same river, a few miles from the above-mentioned place, a small company took possession of a tract of land, and in order to make a clearing cut down trees without discrimination. Over a hundred trees were thus cut down for the sake of a few acres of sun-lit bottom land. Such acts as the above should be punished, and the sooner a law is framed to meet such cases as the above mentioned, the better it will be for the future generations in California.

The successful introduction of logging railroads in various parts of this State, has brought under tribute an immense acreage of the finest redwood in the State. When the senior editor has fully recovered from the effects of his recent severe illness, he will present many new and original ideas in regard to the great redwood lumber interests of the only State in the Union that produces this splendid lumber.

Protective Movements of Mechanics.

Recently we have noticed calls for the assembling of mechanics engaged in some of the branches of building operations, but can state nothing of a definite character in relation thereto, as we have not been present at any such meetings, nor have the proceedings been reported to us by the *proper authorities*. The individual statements of many of the interested parties set forth that the purposes in view are to mature, establish, and bring into practice such rules of action and mutual understandings as will be calculated to protect and advance the legitimate interests of the respective classes, and the uniting of all in one common purpose to advance the best interests of all who are compelled to pursue the paths of daily toil to obtain the necessaries of life.

All movements having for their object the elevation and improvement of the mechanical and laboring interests, and the advancement of the working classes, will receive our hearty co-operation and support, so long as moderation, wise council, and prudent action characterizes such movements. This will be the case, if the better and more intelligent men step to the front, and assume control and direction; but if the overzealous and imprudent become the moving and leading spirits, the influence may be disastrous. Men of right mind and honest motives will gather and cluster around the pure and good in every direction, while from the impure and wrongful they will fly with swift tread. We therefore council, that whatever the mechanical and laboring classes may undertake, that prudence, discretion, and good judgment be exercised; for power and success are found in these, while failure is sure to follow all harsh, selfish, and unwise actions.

Uses of the Steel Square.

[ERRATA.—*In the first line of Rule* 1, *as given in our last issue, the words right-angle triangle should be equilateral triangle.*]

A square is the largest parallelogram that can be inscribed in a circle. Draw diameters A B and C D at right angles to each other. Join the points A C, C B, etc., and a perfect square will be formed.

To inscribe a pentagon in a given circle.

Draw the diameters A *p* and *m n*, at right angles to each other; bisect *o n* in *r*, and with *r* A as a radius, describe the arc A *s*; from A, with the radius A *s*, describe the arc *s* B. Join A B. The distance A B is equal to one side of the pentagon required; carry it around the circle five times, and a perfect figure of five sides will be formed.

RULE 2.

To obtain the bevel of a cut necessary to be made to form a pentagon, or figure of five sides, place the blade of the square on 13¾ and the tongue on 10 using the bevel formed by the short arm of the square. Cut five pieces of equal length with the ends beveled according to the rule; by putting them together a perfect pentagon will be formed.

To form a hexagon, or figure of six sides, carry the radius A H six times around the circle.

RULE 3.

To obtain the bevel of a cut necessary to be made to form a hexagon, place the blade of the square on 7, and the tongue on 4, using the bevel formed by the tongue or short arm.

To form a heptagon, or figure of seven sides.

The principle contained in the following can be used to obtain a figure of any number of sides. If a decagon is wanted, divide diameter into ten equal parts. If a figure with seventeen sides is desired, divide into seventeen equal parts, and so on.

Draw the diameter A B, and divide it into seven equal parts as shown. Draw diameter F H at right angles to A B. Divide E F into four equal parts, and set off three of these parts on the extension of diameter F H. From C, through the second division in the diameter, draw C D. Join A D. The distance A D carried around the diameter seven times will form a perfect heptagon.

RULE 4.

To obtain the bevel of a cut necessary to be made to form a heptagon, place the blade of the square on 12⅝ and the tongue on 6 using the bevel formed by the short arm.

To form an octagon, or figure of eight sides.

Next to the square, this figure is used more than any other. There are many simple ways in which this figure can be formed, several of which have from time to time been given in the columns of this journal. We select the following as a very *practical* way to work the octagon:

If the timber is not square, mark off the largest square that can be formed. Draw a line from corner to corner, as A B. Mark the distance of one side of the square, as A D, on the diagonel A B, at C. Draw C K parallel to E B. Set a gauge to B K, and run this distance on all four sides of the square. Work off the corners, and a perfect octagon will be formed.

RULE 5.

To obtain the bevel of a cut necessary to be made to form a octagon, place the blade of the square on 18, and the tongue on 7⅛, using the bevel formed by the short arm.

To construct a scale by which the side of any octagon is known at once.

Take any right angle, as A B F. From B, with any radius, draw the quadrant A D; divide it at C; with C as a center and with any radius, make an arc at O; with same radius and center D intersect the arc; through the point of intersection draw B K, and the scale is complete.

To prove the scale, make the distance B F equal A D, figure 5; square up from E, cutting at H; then F K equals 2 L, the side of the octagon.

The above is an exceedingly neat and easy way to get the side of an octagon without drawing the whole figure.

We have now described the principal figures that are in practical use. By using the method adopted in Fig. 4 it will be very easy for the student to form a figure of any number of sides. If a *nonagon* is desired, divide the diameter into nine equal parts, and proceed as laid down. If a *decagon* is wanted, divide the diameter into ten parts, and proceed as above; and so, with any figure, divide the diameter into as many parts as there are sides to the required figure.

Or, having a figure of five sides (Fig. 2) and a decagon is wanted, divide the sides of the pentagon, and draw lines from the center through the points of division. By connecting the points of intersection in the circle with the points of the pentagon, a perfect ten-sided figure will be formed.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

loss; it simply provided for doing more cheaply and efficiently the labor which had hitherto been done by hand. The loss remains the same, and upon the same party. Hence no change in the custom of measuring took place on the introduction of machine dressing.

The second proposition of our correspondent, however, introduces a different element. If a board is crooked it must be measured straight, if entitled to measurement in the grade for which it was intended. Usually crooked lumber loses in grade, but if passed, can be measured only for what it will make. If it is a wedge strip, it is to be measured at its narrow end, for it can only make so wide a piece of flooring as can be manufactured with parallel lines. If it is crooked so that an inch is lost in making it straight, the loss falls on the manufacturer at the sawmill, not upon the planing-mill, and only to the reasonable extent of ordinary loss in dressing upon the purchaser of the planed lumber. Such a strip as our correspondent describes should be measured at five inches in the rough, and would be considered as a piece of five-inch flooring when matched and dressed. This rule holds good in all markets of which we have knowledge.—*Ex.*

Pacific Coast Association of Architects.

The regular monthly meeting of the above Association was held in the rooms of the Art Association, Friday evening, May 5th.

Committee on the first competition designs reported progress, as it is their intention to present a very complete report, so that the students and draughtsmen engaged in the struggle may understand their shortcomings and be prepared to enter future contests with more determination to excel.

The Constitution and By-Laws were presented to the Association for approval. After being read and discussed *ad seriatim*, the Secretary was ordered to have fifty copies printed and distributed to the members, so that they will be fully prepared to discuss them at the nextmeeting.

After a spirited debate, the first section was unanimously adopted. By this act the Pacific Coast Association of Architects is merged into the SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS, being the first Chapter instituted this side of the Rocky Mountains.

A vote of thanks was tendered the committee who had so ably performed the arduous task of preparing a complete Constitution and By-Laws.

A committee of three was appointed to nominate officers for the ensuing term. Said committee consists of Messrs. Curlett, Wolfe, Sr., and Moore.

A special meeting was ordered called for the purpose of receiving and acting, if need be, upon the report of the above committee, and also to further consider any unfinished business.

NIGHT OF MEETING, MAY 12TH, AT 7.45 P. M.

Secretary was authorized to visit members in arrears, and request them to be present at the next meeting.

Premiums were ordered paid to the successful contestants in the second competition for new heading of the CALIFORNIA ARCHITECT AND BUILDING NEWS.

Besides its uses for adulterating other oils, as a substitute for animal fats in culinary purposes and as a lubricant, the cotton seed oil is now coming into use as an illuminator, said to be superior to lard oil, making a pure white light and emitting no smoke. As far as the test has gone, it is especially useful for mining purposes, as it will not congeal as quickly as the lard oil.

The Redwood of California.

There are many things connected with the location of the redwood that have been a source of deep study amongst our scientists. Why should the trees only be found along the California fog belt? Why is it that in ravines opening towards the ocean, exposed to the fogs, the bottom should be covered with a heavy growth of redwood timber, and as we ascend up the steep mountain sides the redwood gradually diminishes in size and number, until it is lost to our view on account of its place being taken by the pine and a thick undergrowth of various woods. We have personally noticed this fact, that in the bottom of the ravines we find the redwoods fully developed, but disappear almost entirely on the summits of the various mountain ranges. Fog seems to be as absolutely essential to the redwood as the sun is necessary to flowers.

It must not be supposed by our readers that our immense forests of redwoods do not contain any other kind of timber. Fir, pine, and spruce are liberally sandwiched amongst the redwood. This may or may not be advantageous to the millman. When the loggers and choppers start out to their work, they generally make a clean sweep as they go. Pine or redwood, the path is made clear. But when the logs get to the mills, they have to be assorted. The sharp, full-swedged teeth of the saws that cut their way with so much velocity through the soft redwood will not do for the hard flint knots of the pine, and so when a supply of pine logs are on hand, the teeth of the saws are generally changed.

One immense advantage the redwood has over the timber in forests in the Eastern and Western States, is its size. We have seen trees standing so close together that a man on horseback would find much difficulty in getting between them. Many of them will not have even the smallest branch for at least one hundred feet from the ground. We have frequently seen trees cut into logs, that would make in lumber at the mill over 100,000 feet. Logs at the mills on Humboldt Bay will average over seven feet in diameter. Twelve and fifteen feet diameter is very common for logs, although when they are of that size they are halved or quartered by blasting. One of the largest and finest churches in the city of Santa Rosa is built completely from lumber obtained from one tree; even the shingles were made from bolts obtained from the same source. Speaking about knots, the meanest of them all is a hard, flinty, dry, redwood knot. If our Eastern friends do not think so, let them take a dry redwood board with one of the above-described knots. Let him have a nice sharp saw, and just as he gets near a knot, let him give a little extra hard push so as to get through quick; take our word for it, a surprise will be in store for the man with the saw, for he will actually think a "*blizzard*" has struck a sand dune, and deposited the contents of it in his eyes and down his back. And then let him examine his saw, even if it is SPAULDING'S best. (Our friends of the Pacific Saw Works in this City thoroughly understand this knotty subject, and the temper of their saws is such that even a hard redwood knot is successfully cut by their saws.)

We will feel indebted to any one of our Eastern readers who will forward to us the proportion between rough and clear timber that is obtained from logs in the forests of Maine and Michigan. In redwood the proportion varies. In the more northern counties, as Del Norte and Humboldt, the average of clear lumber in a tree is over 50 per cent.; in Mendocino it is a little less than 50 per cent.; while in Sonoma it is only about 25 per cent.

An erroneous impression prevails amongst some of our subscribers in regard to the reproductive power of the redwood. When a tree has been cut down, shoots will soon make their appearance, which in a few years grow to considerable dimensions. Now, in all earnestness, we think there ought to be a law to protect these young shoots of future grants, and a very stringent one at that. Uses of the Steel Square.

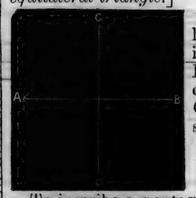
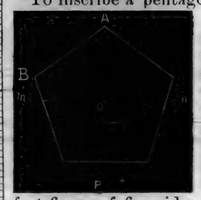
[ERRATA.—*In the first line of Rule* 1, *as given in our last issue, the words right-angle triangle should be equilateral triangle.*]



A square is the largest parallelogram that can be inscribed in a circle. Draw diameters A B and C D at right angles to each other. Join the points A C, C B, etc., and a perfect square will be formed.

To inscribe a pentagon in a given circle.



Draw the diameters A *p* and *m n*, at right angles to each other; bisect *o n* in *r*, and with *r* A as a radius, describe the arc A *s*; from A, with the radius A *s*, describe the arc *s* B. Join A B. The distance A B is equal to one side of the pentagon required; carry it around the circle five times, and a perfect figure of five sides will be formed.

RULE 2.

To obtain the bevel of a cut necessary to be made to form a pentagon, or figure of five sides, place the blade of the square on 13¾ and the tongue on 10 using the bevel formed by the short arm of the square. Cut five pieces of equal length with the ends beveled according to the rule; by putting them together a perfect pentagon will be formed.

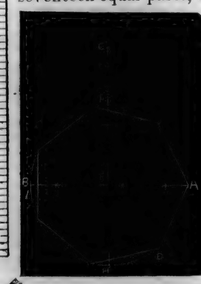
To form a hexagon, or figure of six sides, carry the radius A H six times around the circle.

RULE 3.

To obtain the bevel of a cut necessary to be made to form a hexagon, place the blade of the square on 7, and the tongue on 4, using the bevel formed by the tongue or short arm.

To form a heptagon, or figure of seven sides.

The principle contained in the following can be used to obtain a figure of any number of sides. If a decagon is wanted, divide diameter into ten equal parts. If a figure with seventeen sides is desired, divide into seventeen equal parts, and so on.



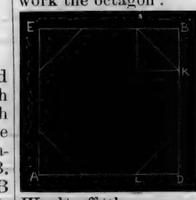
Draw the diameter A B, and divide it into seven equal parts as shown. Draw diameter F H at right angles to A B. Divide E F into four equal parts, and set off three of these parts on the extension of diameter F H. From C, through the second division in the diameter, draw C D. Join A D. The distance A D carried around the diameter seven times will form a perfect heptagon.

RULE 4.

To obtain the bevel of a cut necessary to be made to form a heptagon, place the blade of the square on 12⅚ and the tongue on 6 using the bevel formed by the short arm.

To form an octagon, or figure of eight sides.

Next to the square, this figure is used more than any other. There are many simple ways in which this figure can be formed, several of which have from time to time been given in the columns of this journal. We select the following as a very *practical* way to work the octagon:



If the timber is not square, mark off the largest square that can be formed. Draw a line from corner to corner, as A B. Mark the distance of one side of the square, as A D, on the diagonel A B, at C. Draw C K parallel to E B. Set a gauge to B K, and run this distance on all four sides of the square. Work off the corners, and a perfect octagon will be formed.

RULE 5.

To obtain the bevel of a cut necessary to be made to form a octagon, place the blade of the square on 18, and the tongue on 7⅛, using the bevel formed by the short arm.

To construct a scale by which the side of any octagon is known at once.

Take any right angle, as A B F. From B, with any radius, draw the quadrant A D; divide it at C; with C as a center and with any radius, make an arc at O; with same radius and center D intersect the arc; through the point of intersection draw B K, and the scale is complete.

To prove the scale, make the distance B F equal A D, figure 5; square up from E, cutting at H; then F K equals 2 L, the side of the octagon.

The above is an exceedingly neat and easy way to get the side of an octagon without drawing the whole figure.

We have now described the principal figures that are in practical use. By using the method adopted in Fig. 4 it will be very easy for the student to form a figure of any number of sides. If a *nonagon* is desired, divide the diameter into nine equal parts, and proceed as laid down. If a *decagon* is wanted, divide the diameter into ten parts, and proceed as above; and so, with any figure, divide the diameter into as many parts as there are sides to the required figure.

Or, having a figure of five sides (Fig. 2) and a decagon is wanted, divide the sides of the pentagon, and draw lines from the center through the points of division. By connecting the points of intersection in the circle with the points of the pentagon, a perfect ten-sided figure will be formed.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

The Architecture of the Renaissance.

This new style of architecture, which is known by the distinctive name of the RENAISSANCE, that is to say, the new birth of Roman architecture, first sprang into existence in Italy as early as the beginning of the fifteenth century. It reached its zenith in that country in the course of the same century, and at the beginning of the following became a model for all other countries, in which, however, the Gothic style prevailed for some time longer, and maintained its ground against the encroachment of its rival. In Italy, on the other hand, the pointed style was abandoned, except in isolated instances, and notably in Lombardy. The style which was thus introduced into the countries north of the Alps was consequently accepted there as one which was already developed, and the buildings constructed in it were mere imitations of the Italian; moreover, after it was introduced, it underwent no further change or development, and on that account was designated, especially in Germany, as the Italian style.

At the early epoch of its existence the new style of architecture displays not so much an alteration in the arrangements of the spaces and of the main features of the buildings, as in the system of ornamentation and in the aspect of the profiles. The object and construction of the buildings of the period in question were very different from the collosal monuments of ancient Rome, which were now to serve as an example; and consequently the model was mainly copied in the decorative details, principally in the columnar orders with their various entablature. It is owing to this cause that the façades appear to a certain degree to be merely appendages to the main building. Architects, moreover, could not at once abandon the customary freedom of conception which had been permissible in the Romanesque style, nor subject their imagination to the strict rules of Roman architecture, by surrendering all endeavors to attain picturesque effects. Roman architecture was consequently not at first a model which secured that slavish obedience which became its prerogative in later times. At the outset, moreover, the essential character of Roman architecture was not fully understood, as far as material and construction are concerned: It was consequently only in the case of buildings which did not require a total abandonment of the prevalent style that Roman architecture was at first employed.

In accordance with the tendency of the age, ecclesiastical architecture, which had assumed such prominence during the prevalence of the Byzantine, Romanesque, and Gothic styles, was now thrown into the background; whilst the style of the Renaissance was brought to the front, in the construction of castles and palaces. The varieties that occur in the style of the Renaissance are therefore not to be considered, as in the case of the previous styles, as the result of time and national peculiarity, but rather as the effects of individual and assumptive personal conceptions.

The first period of this modern style of architecture is also its brightest one. The façade of the Certosa, at Pavra, may be cited as the most notable instance. This was begun by Ambrogio Borgognone in 1473, and is very rich in sculpture; but the rest of the building, with the exception of the dome, which is also Renaissance, belongs still to the Gothic period.

The invention of printing exercised a considerable influence on the development of this style of architecture. The works of Vitruvius were translated into Italian and printed in 1521, and were soon extensively circulated. Owing to the tendency and predilection for classical antiquity which were then beginning to be displayed, as well as to the scanty knowledge of Roman architecture which the world then possessed, it is not to be wondered at that these works soon came to be viewed as an authority. But although the writings of Vitruvius, and laws of architecture based on the classical monuments themselves, were considered as authoritative, still the traditional forms were employed in a new spirit and in a new manner. A striving for the picturesque is perceptible amidst the massiveness of the new style. At first this tendency was confined within discreet bounds, but after the first twenty years of the sixteenth century it was extended to an undue degree.

During the flourishing period of the Renaissance, architecture showed less hankering after mere richness of detail, and strove rather after noble simplicity; and this tendency was exhibited even in interiors, although in a modified degree. This flourishing period lasted scarcely fifty years, and occurred at the middle of the sixteenth century, and during its prevalence decoration was kept in due bounds, and in harmony with the principal forms. At the same time it cannot be denied that a certain architectural beauty, or at least a pleasant effect, was often produced in the later period of the Renaissance when the decoration was no longer so well regulated, and when the details were not in such strict accordance with the main object of the design.

The artistic influence of Italy came into operation in France sooner than in other European countries, for as early as the fifteenth century the Renaissance style was introduced there by Italian architects; as, for instance, by Fra Gioconde, who was summoned thither by Louis XII. But at that epoch, the Flamboyant style was still in its vigor, and the buildings then erected could not extricate themselves from its influence. The consequence was that a blending of the two styles temporarily prevailed.

In the second half of the seventeenth century, the better tendencies of the Renaissance period disappear, and the new edifices display proofs of a deterioration of taste; the degeneration which had set in continued to increase with time, as may be gathered from the various buildings of the reign of Louis XIV. In accordance with the disposition of that monarch, architecture was for the future only to give expression to that proud pomp which characterized all the undertakings and the whole reign of the grand monarque.

The principal architectural activity of this period was displayed by Jules Hardouin Mansard, who was head architect to the king, and the head of an influential school. He freely introduced mirrors in the embellishment of rooms, especially in connection with the fireplaces, and may be said to have now become a distinctive feature in the decoration of interiors. On Mansard's death, a new system of decoration arose for interiors, which is often known under the designation Roccoco. This style will be described in a future issue.

The Renaissance style was introduced in Germany about the middle of the sixteenth century. Spain and England adopted the style about the same time.

It must be remarked that the sculptured ornament of the early Renaissance was distinguished by its excellent effect, due partly to the fact that the separate portions of the decoration were varied both in their bulk and in the degree of projection given to them, but more to vigorous undercutting and skillful disposition of light and shade, so that when seen from a distance only a few points stand out in prominent relief. It is only on a close inspection that the more delicate lines of the leaves, tendrils, and figures which connect together these large masses display themselves. The masterly manner with which Renaissance ornament is treated appears chiefly in the fact that all portions are not dealt with alike, the finest effects being obtained by the subordination of individual portions and the prominence given to those which are most important. The ornaments are also so arranged as to form a pleasing contrast with the containing or adjoining architectural lines, and are fitted and subordinated to them—a matter of the highest importance. In this respect the later Renaissance cannot boast of equal success. On the contrary, more salient ornaments began to be uniformly employed, and in too great profusion. Increased richness of effect was, it is true, thus arrived at, but the productions lost in grace what they gained in richness. As a sort of counterpoise to this tendency, the architectural moldings and details were executed in a more decisive and prominent way, so as to keep the decorative details in subordination to the main plan. On the other hand, ornamentation tried by dint of increased extravagance to accommodate itself to the exaggerated architectural features. The result of this was that the style became heavy and inartistic.

The *Sanitary Engineer* contains a letter from a practical plumber, which is full of interest for those careless or uninstructed plumbers, architects, or amateurs who still continue to countenance the dangerous practice of using chimney-flues as conduits for the foul vapors of vaults or drains. According to this correspondent, a soil-pipe in a large Western hotel was carried into a flue of a chimney which was constantly warm. There could hardly be much question that an ascending current of greater or less force would be constantly maintained in such a flue, so long as the supply of air was kept up from the soil-pipe; but in spite of this the foul gases diffused themselves so rapidly through the brickwork into the rooms adjoining the chimney as to cause a deep stain in the plastering, and to render it "as soft as putty." In addition to this, as the letter says, "the stench created was terrible." What could have caused the softening of the plaster we do not quite understand, unless, perhaps, some oxidation of the ammonia from the pipe into nitric acid may have taken place in the pores of the mortar; but we can fully comprehend the discoloration and the stench, which were only the natural result of the arrangement. The writer adds that "the soil-pipe has since been run through the chimney and about six inches above it. There has been no trouble since." We hope besides this all the plaster over the flue, if not the whole of the inclosing brickwork, has been removed and replaced with fresh material. If this has not been done, we can assure all whom the information may concern that the rooms through which the flue passes will for a long time be dangerous to their occupants. The organic filth with which the bricks and mortar are saturated will, notwithstanding the cutting off of further supplies, and the cessation of "trouble," continue for many months, or even years, in a state of what may be called malignant decomposition, pouring volumes of virulent though subtle poison into the air. Disinfection, as ordinarily practiced, can do little toward purifying walls so corrupted; nothing short of complete extirpation of the materials exposed and the substitution of new can give any real security.—*The American Architect and Building News.*

Removal of Metallic Particles from the Cornea.

The "Glasgow Medical Journal" (February, p. 150) quotes from the "Revista de Sciencas Medicas" the following hint as to the treatment of foreign metallic bodies in the cornea. A blacksmith, while forging a piece of iron received in his left eye a splinter of the metal. Every effort made according to the ordinary methods for its removal having failed, Dr. Rodriguez employed a wash consisting of rose water, 90 grammes; iodine, 0·05 gramme; potasium iodide, 0·05 gramme. The result was satisfactory, the particle of metal being converted into iodide of iron and dissolving out, and the cornea regaining its normal condition.

Tinting Suburban Residences.

The subject of painting suburban villas is attracting more attention now than formerly. The styles heretofore prevalent have become too negative in their effects to suit the cosmopolitan æsthete. And it is for this reason we must cater to tastes that have had an education in other countries. With us the burden of coloring has become too heavy, assuming the austere to coldness. Such colors, like the natural stones when massed in large structures, look well invariably, but soon they become monotonous from their stern, unyielding nature. Few venture out of sight of some known color, and others copy leaden hues draped in sable fringes, because, forsooth, some other house has been thus hideously shrouded in the habiliments of mourning.

When buildings, new or old, are to have new coatings of paint, they should be patterned after the opening of spring-time, with the gayly hued flowers. The blooming tinted fields, ablaze with parterres of bright yellow and purple, with variegated patches, lighting up the green sward with their gay attire. Such gay adorning colors make our home spots more endearing, and we look forward, when returning to them, as the sunshine where we can enjoy the home sweet home of the family circle amid its joyous surroundings. A house in color is far more attractive than those whose vestments are carbonated with lead, and they will out-wear those without color, as the former is a protector.

For a country residence Plate B, in the January number of the CALIFORNIA ARCHITECT AND BUILDING NEWS, is a fine one for the exhibition of color. Supposing its site to be well adorned with trees and ornamental foliage, the house would look well in a suit of colors on body and its outlines. The first to have a light shade of yellow or peach bloom, with the second a light dove-tinted blue, the sash and doors of mahogany color. The base, steps, and landings a light red sandstone. The roofing and other coverings a deep blue-green, with chimneys of house colors. The effect of such a scheme of coloring is fine when blended with exteriors of sky and earth; it will be found in harmony with all nature. Should the taste require more subdued shades, a body color of pearly hue might be substituted in lieu of the warm tint named above. The February number contains Plate No. 2; here we have an elevation of a plain dwelling, with an ordinary village surroundings. This style of house will look well in one shade of light cream-color, or it may be trimmed with pure white, roofings dark Indian red or Prince metallic, doors oak, and the sash bronze-green. The steps and floorings to base line be done in granite or a marble of the same tone. Plate No. 4 in the same number represents a one-story house of elaborate finish. This building would look well in two colors, the body of a light canary-color with a tint of canary-olive for the outlines, picked in with the light in the paneling and columns, doors and vestibule walnut or rosewood, and sash to match. The steps variegated marble, and the blocked base. The same or crome-orange and blue in alternate blocks, with walks of granite along the front and sides. The coping of roof blue slate-color and chimneys in base colors. It may be said that such a code of colors are too exotic in tone, and tropical in their nature. That is very true, they have a very strong inclination to strong hues, but such a scheme properly managed must have a unique effect if supported by proper relatives. In the March number there is in plate No. 1 a neat suburban residence. A building in this style dressed in a suit of any lively colors will have a fine effect. In a suit of light drab, with light or dark shade for trimmings, roofing in deep blue slating color, with bronze sash and walnut doors, brick underpinning red, lined with white or black. I have tinted this sketch in canary-yellow, with a subdued crome for the outlines with light prussian blue slating, and its effect is bright and cheerful with the green foliage flanking its sides, while the grass plats in front mass in full dress parade.

In Plate 2 there is an elevation of a church which we would suggest a coloring in which it would look attractive. The rustic to have a light olive, trimmed with a warmer tint in which yellow prevails, roofing Indian red, doors in rosewood. The pediment over entrance a dove-colored blue, serving as a background for tablet. Sashes in deep vermilion where the glass is not stained, but if colored, the sash bars should be deeped with a tuscan red, and made in tone with ultramarine blue. The steps and risers to be laid in with light sandstone and a similar shade for base, if of wood. Let not the color blindness of the past prevail, but rather cultivate imitation of nature and put off the sackcloth and ashes of the past, and let the rainbow of promise shine in all its beauty.

J. E. W. C.

Scarcity of Draughtsmen.

For the first time in many years, Architects find it very difficult to secure the services of competent draughtsmen. During the prevalence of the dull times, during the past two years, the more energetic and competent ones betook themselves to places that were not affected with Kearneyism, or ground down by the encroachments of a foreign population. Some engaged in other occupations, and do not see the wisdom of making any change for the *present boom*, not knowing that it is destined to last for any length of time.

From Santa Barbara on the south to Portland, Oregon, on the north, we hear of inquiries for draughtsmen. Architects in Sacramento, Oakland, etc., have been obliged to let work stand, while trying to secure competent workmen. Two things have worked around to cause this state of facts. The farmers have had "two years of plenty," and a third is almost assured. Consequently all our country Architects are fairly busy, needing the services of help that a year ago was dispensed with, even if it did cause the *head* of the office a few hours more of work in evenings and Sundays. *Now*, the Architect finds it more profitable to spend *his* time interviewing his friends in regard to future improvements, while his assistant in the office prepares the plans from sketches which his superior has given to him.

Another cause may be found in the stagnation of the mining market. Capital will not lie idle, when there is any show whatever for its investment. Now as mining stocks fail to return any investments worth considering, capitalists look around for other and safer methods of putting their money where a sure return will await them. No surer and safer method exists than in the purchase of real estate, and the erection of houses either for rent or speculation.

One but needs examine our report in last month and this number's "BUILDING INTELLIGENCE," to see at once that an unusually large number of buildings are in process of erection. With such a showing in this city, and with work starting up all over the State, it does not seem surprising that draughtsmen's services are at a premium.

We do not intend that our Eastern friends, who read this article, should understand there is an opening here for a number of draughtsmen immediately, and California-like, pack up their things and start for this place, trusting to luck to get into a good office for an indefinite time. At present 15 or 20 good draughtsmen could possibly secure profitable engagements, but for how long a time would depend greatly upon their qualifications.

Should any of our Eastern friends desire to make the "Golden State" their home, we will take pleasure in informing them of their chances to secure employment. When writing, state age, qualifications, etc., so that we may not make false statements to those desiring draughtsmen. Be sure and state the number of years you have been engaged as draughtsman, and the degree of skill at which you have arrived. All such will have to register themselves, the same as if they were already here.

Our "REGISTER FOR DRAUGHTSMEN" is open to all, and the same conditions apply to all, whether in this State or not. A fee of $2.50 is charged. When paid, it entitles the payee to information as long as he remains in the State, even if it be 20 years. No other expense is attached in any manner. As we stated in our last, this fee has become a necessary charge for us to make, owing to the fact that many letters are sent to us every month, and so far we have borne the expense of stamps, etc., without a murmur. But owing to the fact that this Journal is an assured success, and that soon an extra clerk will be needed, part of whose duties will be the supervision of the Book of Registration, we think it no more than just that the parties benefitted should share part of the expense. Hence the Registration Fee of $2.50.

Ventilation and Fresh Air.

Fireside comforts are almost inseparable from the idea of an open fireplace; and from a hygienic standpoint, too, the old-fashioned chimney, or an open grate, is far superior to a closed stove. But it should not be forgotten, writes Dr. Oswald, in the *Popular Science Monthly*, that the operation of the chimney-draft alone is insufficient to correct the vitiated air of a small room; it merely creates an outward current. An open window completes the renovating process; in cold weather a few minutes are sufficient to revitalize the in-door atmosphere for a couple of hours. Only the blindest prejudice can deny the pleasant effect of such an influx of life-air; it revives the azotized lungs as a draft of cool water refreshes the parched palate. Colds are never caught in that way. The very name is a misleading misnomer; inflection or influenza would be the right word. Long exposure to a freezing storm, in certain cases, induces a pure pleuritic fever—a very rare affection, and entirely different from the only too familiar catarrh.

What we call a cold is caused by the influence of impure air, or dust, on the sensitive tissue of our respiratory organs; subsequent exposure to the open air merely intimates the crisis of the disorder—the discharge of the accumulated mucus through the nose or throat. Fresh air is here only the proximate cause, as in tooth-ache, or in those paroxysms of retching following upon the first respiration of a half-drowned person. If we postpone the crisis by persistently avoiding the open air, the unrespirable matter, instead of being discharged, will be deposited in the tissue of the lungs in the form of tubercles.

One of the questions most frequently asked in respect of professional practice is answered in *La Semaine* according to the French custom. Some individual, apparantly a manufacturer, writes to inquire whether he has not a right to the original drawings and specifications of a building which he has just had constructed for him, and if the architect refuses to give them up, whether he is not entitled to keep back a part of his commission. To this *La Semaine* replies that "the architect is bound to deliver up to his client a copy of the plans and specifications; but that these documents are usually furnished at the beginning of the work, for the assistance of the client in discussing and fixing the details of arrangement and construction, and if these are mislaid or thrown aside, he is not required to furnish a second set."—*The American Architect and Building News.*

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

[While this column is open to all, farmers as well as mechanics, engineers as well as architects, we would call particular attention to one and all to have their questions and the information desired to be in accord, as far as possible, with the interests of this journal and for the carrying out of those principles for which the only monthly of its kind this side of the continent, was established. We will endeavor to answer all questions in a fair and impartial manner, and if it becomes necessary, will furnish cuts for the illustrations of any problem, provided we regard the solution thereof as beneficial to the majority of our readers. We would urge upon our patrons the necessity of being pointed in their questions, concise in the language used; let the writing be distinct, and one side of the paper only to be used; give full name and address, and particularly mention if their proper name shall be used.

We want it distinctly understood that the responsibility of signed articles rests with the authors.

Correspondents will please direct all communications to the business manager of this journal—240 Montgomery street, rooms 12 and 13.]

FRIEND ARCHITECT: I often find difficulty in getting my paper to stick to my draughting boards. I use mucilage made by myself from the best Gum Arabic, but after the paper is seemingly stuck, it will curl off. What is the remedy to apply?

DRAUGHTSMAN.

One of the difficulties with Gum Arabic lies in the fact that when it is thoroughly dry, it becomes brittle and the object falls off. A good and simple remedy for this difficulty lies in the addition of from five to ten drops of glycerine to each fluid ounce of mucilage. Also, be sure there is no dust on your board before you attempt to stick your paper on.

BUSINESS MANAGER OF ARCHITECT: In your "History of the Steel Square," you gave a very good description of the early history of that instrument. In your researches in regard to the square, you might have noticed the invention of the saw; if so, please interest many of your readers by relating who invented the saw, at what time, etc.

R. & H.

Our researches into the history of the square necessarily led us to notice all the different tools. When or where the first saw was made is simply a matter of conjecture. From the description of the Ark and the Temple of Solomon, we naturally conclude that the saw must have been known at that time. It is represented on the obelisks of Egypt. How they were kept in order, however, is a puzzle, as we do not read of any drawings of files or anything that could be used to keep saws in order. According to the Greeks, the invention of the saw was ascribed to Dædalus, or his pupil Talus. This most certainly is a mistake, as centuries before their time the outline of a saw was inscribed on the Egyptian Obelisks.

The first saw-mill was erected in the Island of Madeira in 1420; and the next at Breslau, in Austria, in 1432.

From the Syriac translation of the Bible we find that Pumps were invented by Otesibus of Alexandria, 224 B. C., and were wholly or partially made of cast brass or bronze.

BUSINESS MANAGER OF ARCHITECT: A claims that a 2x6 inch brace, with the upper end nailed to the plate and the lower end to the floor, is stronger than if the same piece was placed vertically, and the upper end nailed to a stud and the lower end to a joist. Your decision is respectfully desired, as B claims the latter method is much the best, as the brace is liable to sag if nailed the way A suggests, and is therefore liable to interfere with the "plumb" of the building.

L. A. & R. B., S. F.

We think the former method is the stronger, although it is hardly as convenient as the latter, which is the one generally employed in this State. In the latter method, the strain is upon the nails that secure the plate to the stud; while in the former, the plate is held by nails in the several studs, and therefore a brace from it to the floor should keep the side of the building stiffer, than if nailed to only one stud. We do not think the sagging of the brace as mentioned by B will interfere with the "plumb" of the building. It would cause such a small difference that it could not be noticed with the plumb bob.

OUR CABLE ROAD MANAGERS should take precautions against passengers getting out on the side farthest away from the sidewalk. How would the Chicago plan do in this city, of having a small wire gate on the side toward the middle of the track and thus compel travelers getting out on the safe side. It is safe for passengers sitting on the dummy, as they can easily see ahead; but passengers on the rear platform are not so fortunate. A bar or wire gate across the inner side of front and rear platforms would, we think, materially lessen the numerous accidents that occur.

BUSINESS MANAGER OF ARCHITECT: Some time ago I had some red paint sent to me to be used on a barn. A few months after I applied it, it began to peel off. My neighbors say the paint was very much adulterated with brick dust. How can I tell whether such is the fact or not?

R., Sonoma Co.

Take some of the paint (as dry as possible) and heat it gently until the water and oil have been evaporated. Place some of the dry paint in a crucible, and pour upon it dilute nitric acid in quantity enough to dissolve the mass. The acid will dissolve the lead, but leave the brick dust behind. Wash the dust in water, and after drying send it back to the firm from which you obtained the paint, and we have no doubt they will cheerfully forward you the pure red lead.

AN IMPORTANT FACT.—Sheet lead is sometimes placed at the joints of stone columns, with a view to equalize the pressure, and thus increase the strength of the column. But experiments have proved that the effect is directly the reverse, and that the column is materially weakened thereby. Does this singular fact apply to cast iron, and other materials?

IN ANSWER TO A YOUNG PAINTER in Sacramento we would say, that the action of driers in paint is not thoroughly understood. They are put in to cause the oils to thicken and thus solidify more rapidly. The drying of linseed oil is caused by the absorption of oxygen, and there is no doubt that for the most part, driers act as carriers of oxygen to the oil, a very small quantity producing considerable effects. The best driers are litharge, acetate of lead, red lead, sulphate of zinc, etc., etc.

"Theophrastus, quoted by Pliny, attributes the first use and digging of stone from the quarry to Carmus, grandson to Agénor, King of Tyre. Bricks, which were in use from the earliest ages, being mentioned in Holy Writ, would no doubt have continued in use, had not Nature at last discovered to those who dug for that poor material, her mines of freestone and marble, which then promised a longer duration; and on the discovery of stone men naturally conceived the idea of nobler and more magnificent structures."

Steel Square Problems.

A new work explaining the uses of the Steel Square. Sent post-paid to any address upon receipt of 50 cents.

Our Illustrations.

Plate 1 presents another proof of the growing popularity of this journal throughout the Eastern States. Mr. Gulbranson of Boston has kindly furnished us the designs and plans shown in plate 1. It is well suited to the taste and fancy of many who having the proper site for such an edifice, will appreciate its peculiarities and picturesque appearance. It is designed and adapted for a country residence, but some of its special features may be found in erections in this city, in buildings in which the owners have sought the "something new" more than appropriateness in city architecture.

Front elevation and ground plans, plates 2 and 3, are those of a residence erected by us in 1876, for Mr. John W. Coleman, at the northeastern intersection of Eighth and Brush sts., in the city of Oakland. During successive years, moderate enlargement and improvements followed, until in 1881, a thorough change was made, producing the elevation and plans as shown by plates 4 and 5. While a considerable portion of the original building is utilized in plate 3, all distinctive traces thereof are obliterated.

In affecting the last alteration, cost and expense were held secondary to elegance and comfort. While not attempting to aproximate the *magnificient* palatial homes that we read about, yet in all that is necessary to real comfort, and a very *considerable* degree of elegance, is to be found in the residence under notice, equalling in numerous particulars the grandeurs to be found in edifices costing thrice the amount expended in this case. As a whole, Mr. Coleman's premises and improvements rank with the finest and most desirable in Oakland.

Labor Strikes.

The New York *Times* contains a sensible editorial upon the effects and causes of the strikes in the building trades which have been so numerous this season. In no other branch of industry has it been found practicable to increase wages to such an extent as in that of building, and the *Times* rightly regards the advance as excessive, and as likely to lead to a considerable reaction. There is no question that in New York, where the strikes have been most numerous and successful, building has been materially checked, and although the structures now in progress must be completed, the volume of new work is likely to be much smaller at the end of this season than it was a year ago. It was found that the great increase in prices which took place early last year attracted so many newcomers to the city that the rates of wages which the workmen regarded at the beginning of the summer as much too low to satisfy their needs were with difficulty sustained until the autumn, and a similar course of events is inevitable in the future. As the *Times* says, strikes are almost always the precursors of a period of stagnation and dullness in trade. So long as a business continues brisk, and with good prospects for the future, the competition among employers for good workmen insures a quiet but steady advance in the wages of such men; but when the limit of the market is reached, and the outlook begins to be unfavorable, the advance ceases, and the inferior workmen then, with characteristic impudence, endeavor to secure by force what they find cannot be had in the natural course of events. For a time the employers, bound by their contracts, are compelled to yield, but the completion of every contract throws upon the labor market a certain number of unemployed men, and a comparatively slight diminution in the total volume of building operations leaves a residuum of workmen in each trade who must compete with their fellows for such wages as they can get.

THE FRANKLIN GIRDER.

THE MOST ECONOMICAL CONSTRUCTION

— OF ANY MODE AND AT A —

PRICE OF ABOUT ONE-HALF

OF THOSE IN COMMON USE

OF SAME LENGTHS,

— AND TO SUSTAIN —

EQUAL SAFE LOADS.

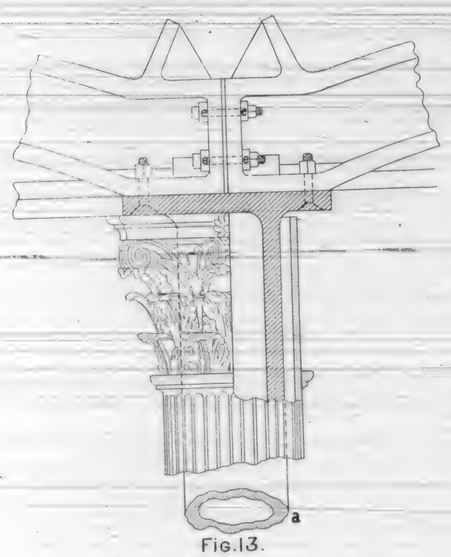

Fig. 13.

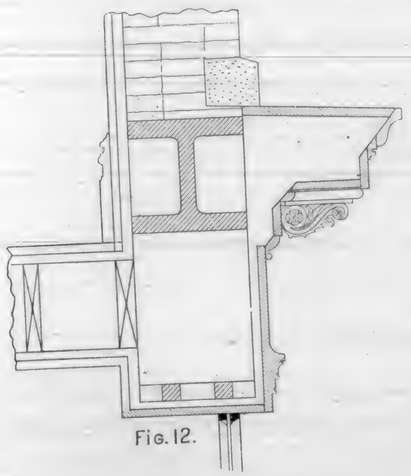

Fig. 12.

Employing Cast Iron compressively in every part, without taxing in the least its comparatively feeble tensile resistance,

AN OBJECT NEVER BEFORE ATTAINED.

Cast Iron possesses the enormous compressive resistance of 93,000 pounds to every square inch of cross section. The great objection to cast iron, caused by contraction of the parts in cooling, the heavier parts controlling and drawing away from the lighter parts, producing inherent weakness in tensile strain—does not in the least impair its strength when compressively employed. The Value of this Invention has been most favorably commented on by the scientific press of this country, London, Paris, and Germany. It has also been received with much favor by the Professors of Civil Engineering of many of the Colleges of this country, as well as Engineers engaged in Railroad and Bridge Construction.

These Girders for Architectural use are made of any length, and to sustain any required load—the safe to the breaking load being in the ratio as one is to three—and at a price of one-half of those in common use in this city.

A TWENTY-FIVE-FOOT GIRDER, with Brick work on it, is now in front of Premises, No. 231 First Street. Suitable to sustain 100 tons. Price, $200. Wrought Iron Girders to sustain same load and of same length, will cost double that Amount.

FIGURE 13

Represents the ends of two long Girders spanning the entire fronts, bolted together, and bolted to a Patent Fire-Proof Column—a Substantial Construction to resist Fire and Earthquake disturbance.

FIGURE 12

Shows the Girder encased with the Cornice, Frieze, and Soffit.

Prices given for any Length of Girder, and to Sustain any Weight.

UTILIZE YOUR BASEMENT APARTMENTS

In the Business Part of the City by using

HYATT'S PATENT ILLUMINATING ROOF

— AND —

BASEMENT EXTENSION.

THE LENSES MAGNIFY, HEAT, AND DO NOT BREAK.

SEE ALL NEW BUILDINGS ON THE BEST BUSINESS MART.

The present dark, damp Cellars, or Coal Vaults, of old buildings made light, cheerful, and well-ventilated Business Apartments suitable for Offices.

Read the following of the many Testimonials received:

LEVI STRAUSS & Co., Importers, 14 and 16 Battery Street,
SAN FRANCISCO, March 4, 1881.

MESSRS. P. H. JACKSON & Co., No. 2 California Street:

The alteration made by you by cutting out the six door sills and risers on the front part of our store, 14 and 16 Battery Street, and substituting HYATT'S PATENT ILLUMINATING ROOF, is quite satisfactory in making in the basement apartment below, in the front part, all that we could desire as regards light. **Our entry clerks are now able to work without the use of gas.**

LEVI STRAUSS & CO.

The **Basements of Messrs. Murphy, Grant & Co's Buildings,** on Bush and Sansome Streets, have been altered and are now lighted by this Improvement.

HYATT'S PATENT

FIRE AND BURGLAR-PROOF SKYLIGHTS.

The public are requested to examine the large Skylights now being erected on the rear of **A. B. McCreery, Esq.'s, Building,** corner Pine and Davis Streets; also **Senator Fair's Building,** corner Sansome and Pine Streets. By the use of these heavy Skylights, which are both fire and burglar-proof, **no extra charge in rates is made by the Insurance Companies than if no Skylights were used,** as they are not destroyed by fire, like the wood and sheet-iron skylights in common use; besides the occupant of the premises may feel his goods are safe from robbers during the time the building may be closed.

☞There are many deep stores in this city that are much in need of light, and by an addition of these Skylights all light can be obtained, besides security against thieves is maintained.

The appearance of the Skylight, as seen from the front of the store when the sun is on it, glistens with the thousands of hexagon lens. The Cosmopolitan Building, as altered, has these Skylights on the rear of the deep stores.

Foul Air in School Rooms.

It is seldom that an assembly room of any kind can be found in which the air is not overcharged with impurities. Some of the worst rooms we have known have been those in which the air ought to have been the purest, namely, school-rooms. Yet it is seldom, we trust, that the conditions obtaining in school-rooms are quite as deleterious as those found recently in the Packer Institute, Brooklyn, a well endowed school for young women. In response to persistent complaints by the young ladies the "Sanitary Engineer" had the air of the class rooms analyzed, finding in some of them "an amount of impurity present greater than in a crowded theater, in smoking cars, and three times as great as in the public schools of Boston or Philadelphia."

Our contemporary pertinently remarks that such an institution "should be able to claim not only that it furnishes the means of mental culture, but that its pupils are supplied with at least as pure air as is found in the public schools of Boston and Philadelphia. Certainly, this is not a very high standard, but to secure it the amount of air supply in the Packer Institute must be quadrupled, and the amount of heating surface largely increased."

A more outspoken statement of the case by the "Times" says that "there were two classrooms in which the proportion of carbonic acid found in the air was twice as great as that present at 11 o'clock at night in the pit of two of the worst ventilated London theaters, and was only exceeded, according to Buck's tables, by that detected in a few German schools, and in the English mines."

To send young people to study in such an atmosphere is simply criminal.—Scientific American.

Plumbers Brought Under the Law.

A plumber is no longer, in the cities of New York and Brooklyn at least, an ordinary person following a private avocation which he may take up or lay down at will without the knowledge or interference of the powers that be. He is distinguished above his fellow-citizens by being registered at the Health Department, his designs upon the community are known and officially recognized, and he is, in short, a marked man. To pursue his calling without thus placing himself on record subjects him to the penalty of a misdemeanor. We alluded the other day to the distinction which lightning-rod men have recently enjoyed, in the holding of a congress of European scientists with sole reference to the uses and abuses of their art. The Plumbers' Registration Act is also, in its way, a sort of promotion of a hitherto obscure and unorganized trade to something like official rank. There is an increment of dignity to its followers, but none at all of emoluments—these, it is popularly supposed, being already of almost princely magnitude.

The whole truth about plumbers can probably never be known, and the logical relation between the benefits they render to mankind and the bills they present will always remain a gloomy mystery. That they deal with the most vital of sanitary conditions, and have it in their power to prolong or abbreviate human life to an extent unknown to any other of the mechanical trades, is sufficiently clear. There is an evident reason why a man should not be permitted to sell gunpowder without a license; and a man who deals in sewer gas it quite as powerful for mischief—much more so, in fact; inasmuch as he finds his way and carries his wares into the most peaceful and unsuspecting households. The poisonous elements which it is his duty to restrain and conduct safely away he may, in indifference if not in malice, turn in full activity upon a host of victims. There is not much to choose between dying by pestilence or by explosion—or rather, the preference should be decidedly given to the speedy over the lingering process. No prudent housekeeper would put a keg of gunpowder in the cellar, or a toy pistol in the hands of the children; but where either or both of these have slain their thousands, defective plumbing has destroyed its tens of thousands, and so insidiously that when the blow falls, or whence it comes, no man is able to determine.

Under the present act, which was passed by the legislature of New York and went into effect on the first of March, nothing more is required than that every plumber shall register his name and location at the Health Department, and that all work of this description in buildings hereafter erected shall be under the control of that department. It has been judiciously remarked that while these are wholesome measures, they do not go far enough to insure the public safety. There is no provision by which plumbing done in buildings now standing can be brought up to the proper degree of thoroughness; there is no qualification required, no evidence of competency, skill, or previous experience on the part of the individual who enrolls himself as a plumber, and by so doing acquires a sort of certificate of fitness for his work, or what will be very generally received as such by his customers. Something of this kind—not an examination in the dead languages, or the Binomial Theorem, but a test such as a competent plumber would himself apply to a workman seeking employment—would be eminently proper, and would give a largely increased sense of protection as a result of the new system. But a step in the right direction has at least been taken, and one which will, no doubt, lead in the fulness of time to such complete regulation of this industry as will afford all possible safeguards to the life and health of the community.—*Mechanical News.*

A Few Kindly Words.

It has been, and will be, our purpose to vitalize and stimulate among the Architects of S. F. those better sentiments and more kindly and fraternal feelings and relationships, which should control and characterize the acts of men assuming the practice of so honorable and responsible a profession as the Architectural; and if the harvest of results has not been so abundant as desired, there is this one solid source of comfort; that the yield thus far gives promise of much greater in the future.

There are two inevitables in the social, business and professional intercourses and relationships of life, viz.: that the deportment, manners, bearings, and acts of individuals or classes of men toward each other, by a natural law of the human mind, lead either to mutual and kind, equitable and right understanding, and results pleasing and honorable in character; or to the opposite of these, stimulated and controlled by the lesser impulses, passions, and debasements of heart and nature.

The men of all professions are supposed to possess and are looked up to by the non-professional classes as possessing, more than ordinary infirmities, intelligence and integrity; and so far as they sustain and justify this enviable distinction, they are trusted and honored. But when from any cause, incentive, or motive whatever, they drop down from this higher and more honorable position, and pursue practices and incivilities among themselves and toward each other, calculated to lower and lessen their advantages and influence, it naturally follows that the "outside world" should lose confidence and sneer at those who might, but fail to, protect their own best interests; and virtually forbid and drive away the confidence and respect which might be secured and maintained by the simple observance and exercise of those better and purer qualities of mind and heart, which elevate our common humanity above all lesser thoughts, motives, and actions; and inspire to undeviating kindness and earnest efforts for the promotion of the welfare of others, as well as our own.

It is this enlarged and more generous principle of action, which has led to the development of tens of thousands of noble charities, and works of enterprise and benevolence; and thrown open the doors of thought all over the world, producing numberless results in art, science, and mechanism, which otherwise might never have been revealed. It is the mingling and commingling—the comparing and burnishing of thought with thought in individuals—that lead to new revealments; and the facts of history clearly prove that no one man has ever "learned it all" in any department of human affairs, and that the wisest and best of men have acquired the better knowledge possessed, only through earnest study and contact with other minds: while those who rely upon their own unaided selfish knowledge of things, soon pump the well dry.

French Architects' Fees.

An important decision has lately been delivered by the Third Chamber of the Civil Tribunal of the Seine, which determines the much-disputed point whether the fee or honorarium of an architect should be reckoned on the limit price fixed before competition, or on the amount of tender accepted. M. Bourdeix, architect, had been commissioned to prepare the plans of a house for M. Jacobi. Various contractors submitted tenders more or less below limit price, the reduction in one case amounting to over 35 per cent. As a rule, in France, the construction of a building is not undertaken by one, but by several contractors, each taking his own particular branch, such as masonry, carpenter's work, plumbing, etc. When the time for payment came, M. Bourdeix, to whom all accounts were submitted, settled with the contractors at the price of their tenders, but claimed from M. Jacobi 5 per cent. on the original limit prict (*devis*). This claim was contested. The owne. paid into court 5 per cent. upon the sums actually dispersed. The tribunal, however, decided that M. Bourdeix was entitled to percentage on the full *devis*, basing its judgment on the ground that all the contractors, having tended considerably below the limit, more care and supervision were necessary on the part of the architect to insure good quality in the work. This decision will no doubt be accepted as regulating fees, and will make a considerable difference in the incomes of many French architects.—*London Architect.*

Morton's Sash Chain.

Since the introduction of these chains in this market, the inquiries in regard to their stability and usefulness have been very general. The inventor has sent samples to the principal architects, so that all erecting buildings may judge of the *vast superiority* of these chains over the now old-fashioned sash-cord. If these chains are put on according to directions, and have the size correspond to the weight of sash, they are guaranteed for years. If not absolutely misused, they will be just as good ten years hence as when first put on.

Circulars with price list may be had by application to the inventor, Thomas Morton, 65 Elizabeth St., New York City. Samples may be seen at the principal architects' offices.

If it is true, as sanitary writers declare, that planting sunflowers about the premises is a preventive of malaria, then Oscar Wilde may not have lived in vain.

Water Waste.

BY PROF. HENRY ROBINSON, C. E.

One of the most fruitful causes of waste of water in houses has been found to arise from the direct flushing of the closets from the water pipes. The rule in England is to prohibit this, and to require the insertion of a small service box supplied by the service pipe, and containing about two gallons of water. This being in direct commnnication with the valve of the closet, prevents more than a regulated amount of water being used at each flush of the closet. It has been found in practice that, without such an arrangement as this, enormous waste arises, and it cannot be too strongly urged on those who have to advise in the regulation of water supply in large towns, to adopt the most stringent rule on this point. Besides the prevention of waste, the introduction of such an appliance as the service box reduces the pressure to a uniform head, which would not be the case were the flush to be taken direct from the service pipe; and beyond this, it is found that any leakage in connection with a service box is attended with inconvenience to the householder, and this results in the prompt rectification; whereas, a leak direct into the closet might continue without inconvenience to the inhabitants, but with certain loss to the water company.

Glasgow may be quoted as a town where excellent rules are in force. The regulations here are that no water closet is to be supplied direct from a service pipe, but must be supplied from a cistern on the same flat as the closet, and no water closet is to be supplied by a tap of any kind. Also, that every cistern for the supply of a water closet must be fitted with an efficient waste-preventing apparatus, so constructed as not to be capable of discharging more than two gallons of water at each flush, and so that it can not be made to flow continuously, either by intention or neglect. It is further required that the cistern must contain from five to eight flushes in all places where the supply of water is not constant. Also, that the cisterns supplying all pan closets must have a proper service box attached.

Leeds is another large town which may be referred to. Here the regulation is as follows: Every water closet has to be provided with a service cistern of lead or cast iron, with a ball cock attached thereto, and every such service cistern has also to be provided with a proper double valve waste preventer; and every such valve or valves has to be so arranged as to let down at each pull or lift of the valves a quantity of water not exceeding two gallons. Also, that no pipe by which water is supplied to any water closet is permitted to communicate, directly or indirectly, with any part of such water closet, or with any apparatus connected therewith, except the service cistern thereof. In London also, the water companies have strict rules requiring the use of waste water preventers.

The above regulations may be regarded as being the outcome of the practical experience of English water engineers. In the water works with which we are connected, we have similar rules, and require them to be rigidly enforced. We do not consider that any alternative, such as specially devised valves, however ingenious, ought to be introduced. There exists a great amount of recorded experience in England, all pointing to the same conclusion, and all indicating the saving that has been effected by putting into force such rules as have been given.—*The Sanitary Engineer.*

Watch-making machinery has been brought to such perfection that screws are made with it, having nearly 600 threads to the inch. It takes 144,000 of them to weigh a pound.

Market Reports.

LUMBER.—Our merchants all report an increasing trade. Prices have not undergone any change as yet.

Receipts since January 1st, 1882:

Lumber	45,679,982
Shingles	12,416,372
Laths	6,102,360

A correct price list of lumber will be found below:

PAINTS.—A new company has made its appearance, introducing the OMAHA WHITE LEAD. With the large demand that is confidently expected this year, the agents should be able to control a fair amount of patronage.

The PIONEER brand has been successfully introduced into every town and hamlet on the Pacific coast, and has given universal satisfaction. We quote price at 8 cts. per lb.

The above is an illustration of one of those useful inventions that have been lately made, and is one of the few that seem destined to live through the coming years, on account of its simplicity and strength, and the ease with which they may be applied. Very few tools are necessary to insert this safe-guard against burglars. A 13--16 inch bit for the bolt, a smaller one for the thumb key, a small screw-driver and a chisel are all that is required. Since their introduction in this market, they have almost superceded every other bolt; and in every village and hamlet on the Pacific Coast, samples may be seen of the Ives Burglar-Proof Door Bolt; manufactured by Hobart B. Ives, New Haven, Conn.

Honest Plumbers in Edward III.'s Time.

What has become of the plumbers' ordinances approved by Edward III. in 1357, which ordain "that every one in the trade shall do his work well and lawfully?" How much pleasanter a world this would be if the plumbers had only continued to do their work "well and lawfully!" A legion of fevers would never have carried off their holocausts of victims; many of our finest and most historic mansions would not have been burned down through the careless leaving of lighted braziers, and untold sovereigns would have been saved to house owners and occupants. It is matter for serious consideration whether, considering the vital importance of plumbers' work, it should not be more strictly looked after. Certainly any system of house inspection, whether compulsory or voluntary, to be efficient, must comprise a more particular inspection of plumbing than is usual at present. It is one thing to inspect the drainage system of a house, and quite another to inspect the workmanship of pipes and joints. In the days of Edward III. the plumbers—in theory at any rate—were men of uncompromising honesty, for they were forbidden by their own ordinances to buy up lead "to the damage of the commonalty."—*Land.*

Building Intelligence.

A very full report is published in this issue. It will be seen that the erection of buildings in every portion of the State is increasing in a manner that is delightful, to behold after the dull times of the past four years.

PERFECT ACCURACY IN STATEMENTS is the motto to which we have bent our energies. We make it a point to be careful in our estimates, so that no one may be misled. We have been informed that several of our estimates made in our list were not sufficient to cover the *whole* cost of the improvements. When the work is let separate it is very difficult to get the *exact* cost of all the different branches. When a building is under way it at once becomes an object for our canvassers to notice, and the contractor is "interviewed." Generally the amount of the carpenter's contract is easily determined; but if he has no control over the plumbing, plastering, etc., we have to make an estimate as near the truth as possible.

During the past month we have personally visited several towns, and made arrangements to have the "Building Intelligence" forwarded to us regularly each month. It is our intention to visit several towns each month, so that in a short time we will be able to present a full report from every part of the State.

SAN FRANCISCO.

Two-story brick building near junction of California and Market. Owner, Nicholas Luning; architects, Wright & Sanders; contractor, J. S. Burpbee; cost, $8,000.

Seventeen one-story frame buildings for stores, on Ellis, between Mason and Taylor. Owners, J. Morton & Co.; architect, Joe Gosling; contractor, G. A. Hastings; cost, $9,500.

Two-story and attic frame dwelling on northeast corner Green and Leavenworth. Owner, R. Carmany; architect, —— Smith; contractor, Gray & Stover; cost, $4,500.

Two-story frame, brick foundation, northwest corner Pine and Fillmore. Owner, G. F. Roberts; architects, Newsom Bros.; contractors, Moore Bros; cost, about $7,000.

Two-story, four-tenement house, on Washington, between Buchanan and Webster. Owner, Mrs. Tuttle; architect, —— Curtis; contractors, Thompson & Treadwell; cost, $2,500.

Two-story attic and basement frame dwelling on northeast corner Pacific Avenue and Steiner. Owner S. B. Welsh; architect, —— Smith; contractors, Gray & Stover; cost, $8,000.

Two-story and basement frame dwelling on Sacramento, between Pierce and Scott streets. Owner, H. Williams; architect and builder, W. H. Wharff; cost, $3,100.

Two-story and basement frame, on California, between Pierce and Scott. Owner, —— Easton; architect, —— Marquis; contractor, —— Perry; cost, $5,500.

Three-story frame building on Third street, near Townsend. Owner, P. Doherty; architect, T. J. Welsh; contractor, —— Doherty; cost, $3,700.

Two-story and basement brick building on Park Avenue, between City Hall Avenue and McAllister St. Owner, H. Wahmuth; architects, Schmidt & Havens; contractors, Walker Bros.; cost, $9,000.

Three-story frame, brick basement, on Howard St., between Seventh and Eighth. Owner, G. Monnier; architect, W. Mooser; contractor, B. H. Harding; cost, $14,000.

Two-story and attic frame dwelling on Twelfth Street, near Mission. Owner and builder, M. Doane; cost, $5,500.

Two-story frame dwelling on Stevenson, near Nineteenth. Owner and builder, P. Griffin; architects, Meeker & Banks; cost, $2,500.

One-story and basement frame on Laguna, between Ellis and O'Farrell. Owner, L. Zeiss; architect, W. Schrof; contractors, Walker Bros.; cost, $2,000.

Six two-story and basement frame on Golden Gate Avenue, corner Polk. Owner, W. Sharon; architect, —— Gaynor; contractor, W. M. Fletcher; cost, $28,000.

Third Street, between Howard and Folsom. Alterations and additions to buildings owned by —— Swift, Esq.; architect, E. R. Swain; contractor, W. M. Fletcher; cost, $10,500.

Additions to building 938 Geary Street. Owner, J. B. Wooster; architect, H. C. Macy; contractor, W. Evans; cost, $2,800.

Three three-story frame on Geary, between Polk and Van Ness Avenue. Owner, T. H. Buckingham; architect, E. R. Swain; contractor, F. Crowley; cost, $——

North side Geary, between Van Ness and Franklin. Two-story frame building for school house for Ladies' Protection and Relief Society; architect, J. C. Pelton; contractor, J. Blake; cost, $2,400.

Three-story frame, brick foundation, on corner Sutter and Buchanan. Owner, C. Jones; architects, Schmidt & Havens; contractor, F. Klatt; cost, $5,500.

Three-story frame on east side Taylor, near Geary. Owner, A. Morganstern; architect, W. Winterhalter; contractor, F. Weinoehl; cost, $6,000.

Four one-story and basement frame, on corner Lyon and Greenwich. Owner, F. Wasserbaum; architects, Townsend & Wyneken; contractor, Phil. Ferrety; cost, $3,200.

Alterations to three-story frame on Mission Street, near First. Owner, J. Tompkinson; day's work; $6,000.

Two-story frame on Mission Street, between Main and Spear. Owner, Payne Bros.; architect, H. Geilfuss; contractor, T. H. Day; cost, $1,600.

Three-story frame dwelling, on California, near Fillmore. Owner, Antonio Sturin; contractor, R. Cook; cost $2,600.

Repairs to two-story frame dwelling 2023 California street. Owner, H. Gerke; days' work; cost, $1,000.

Repairs to building 2507 Clay street. Owner, C. Wilson; contractor, R. Cook; cost, $2,500.

Repairs to building on Pine street, between Steiner and Pierce. Owner, A. J. Rulofson; architect, H. D. Mitchell; contractor, J. Geary.

Repairs to building 806 Bush street. Owner, Mrs. Hughes; contractor, S. M. Hills & Co.; cost, $2,800.

Two one-story frame dwellings on Olive Court. Owner, J. W. Cudworth; Contractor, A. N. Nelson; cost, $1,200.

Repairs to dwelling on Sacramento, between Fillmore and Steiner. Owner, J. Kehoe; contractor, R. Cook.

Two-story frame dwelling on Kentucky, near Sierra street. Owner, H. McCrea; contractor, B. F. Ellis; cost, $2,300.

Three-story frame building on Kentucky, near Sierra street. Owner, Bellman; Architect, G. A. Bordwell; days' work; cost, $5,000.

Additions to three-story frame dwelling on Howard, near First. Owner, J. McGrath; contractor, Jos. Dutton; cost, $4,000.

Repairs to building 71 Natoma. Owner, J. Daly; day's work; cost, $700.

Repairs, 707 Bush. Owner, S. M. Mouser; architects, Percy & Hamilton; contractor, Sanches; cost, $800.

Alterations on Washington, between Larkin and Polk. Owner, T. E. Smith; architects, Moore & Whittemore; contractors, Conrad & Miller.

Buildings on Fifth near Natoma have been lowered, and a new front put in. Owner, N. P. Perrine; day's work.

Two-story frame building on south side Fell, between Gough and Franklin. Owner —— Bailey; Architect, J. Gosling; day's work; cost, about $6,500.

Two-story frame dwelling on Third street, near Brannan. Owner, H. Toner; day's work; cost, $800.

Alterations to building on East street, between Mission and Market. Owner, M. W. Kain; day's work; cost, $1,500.

Two-story frame building on Mission, near Twentieth st. Owner, W. Rustemeyer; architect, H. Geilfuss; contractor, —— Girvin; cost, $3,500.

Two-story frame building on Haight street, near Webster. Owner, Abbott; architect, J. Marquis; contractor, Ingerson; cost, $5,000.

Four-story and basement brick building on north-east corner Post and Dupont. Owner, W. M. Lent; architect, J. P. Gaynor; estimated cost, $100,000.

Two-story and basement frame building on corn r Kearney and Greenwich. Owner, F. Layman; architects, Townsend and Wyneken; contractor, Plummer; cost, $7,500.

Repairs to buildings on Union, near Hyde. Owner, Hibernia Bank; architect, P. Huerne; contractor, Buckley; cost, $1400.

Repairs to dwelling on Howard, near Twelfth. Owner, Hibernia Bank; architect, P. Huerne; contractor, McCready; cost, $900.

Repairs, 1212 Pacific street. Owner, J. Lomax; contractor, S. M. Hills; cost, $550.

Additions to residence on Pine near Mason. Owner, J. R. Jarboe; architects, Curlett & Eisen; contractor, Creighton; cost, $4,000.

SACRAMENTO.

Two-story frame dwelling on H Street, near Eighth. Owner, Grove L. Johnson; architects, Babson & Seadler; contractor, E. A. Bovyer; cost, $5,500.

One-story and basement frame dwelling on corner Twenty-first and H. Owner, H. Kuhn; architect, N. D. Goodell; contractor J. White; cost about, $1,000.

One-story frame on P Street, between Thirteenth and Fourteenth. Owner D. G. Dickman; architect, N. D. Goodell; contractor, J. White; cost, $1,200.

Two-story frame dwelling on Fourth, between N and O. Owner, Chas. Sellinger; cost, $3,500.

Repairs to brick building on Second, between Q and R. Owner, Cronin; contractor, A. Henley; cost, $600.

Two-story frame dwelling on Twelfth, between K and L. Owner, Mrs. E. N. Butler; contractor, W. H. Mead; cost, $1,700.

Two-story frame dwelling with attic and brick basement. Owner, Mr. Mohr; architects, Babson & Seadler; contractors, Carle & Croly; cost, $7,000.

One-story frame, brick basement, corner J and Eleventh. Owner, Thomas Armstrong; builder, J. Fitzpatrick; cost, $2,000.

Two-story and basement brick building on J Street, between Tenth and Eleventh. Owner J. Greisel; architect, N. D. Goodell; contractor, M. Madden; cost, $5,000.

Two-story frame brick basement, corner Tenth and M. Owner, J. Nottingham; architect and builder, M. Madden; cost, $4,500.

Two-story frame, brick basement, on N Street, between Sixth and Seventh. Owner, Capt. Dwyer; architect and builder, M. Madden; cost, $4,000.

Two-story frame, brick basement on H Street, between Fourteenth and Fifteenth. Owner, H. S. Letner; architect, N. D. Goodell; contractor, M. Madden; cost, $9,000.

Two-story brick building corner Twenty-eight and M. Owner, Scheld's Brewery; architect and builder, M. Madden; cost $5,000.

One-story and basement frame dwelling, corner T and Sixteenth. Owner, R. Nuttall; architect and builder, M. Madden; cost $1,800.

Two-story brick stable between I and J, Eighth and Ninth. Owner, E. A. Burr; architect, N. D. Goodell; contractor, M. Madden; cost, $850.

One-story and basement frame cottage corner Twenty-first and M Streets. Owner G. Wendt; architect and builder, M. Madden; cost $1,500.

Repairs and additions to Union Brewery corner Twentieth and O Streets; contractor, M. Madden; cost, $800.

Alterations to Pacific Brewery, corner Ninth and P; contractor, M. Madden; cost, $500.

One-story frame cottage on Tenth and W. Owner, John Bockoff; contractor, M. Madden; cost $900.

Additions to one-story frame on Fifth Street, between O. and P. Owner John Friend; contractor, M. Madden; cost $600.

Alterations to frame dwelling 708 L Street. Owner M. Everett; contractor, A. P. Andrews; cost, $500.

Repairs to brick building corner Twelfth and H. Owner, P. Bohl; day's work; cost, $800.

Two-story frame with basement on H Street, between Thirteenth and Fourteenth. Owner, H. Barchers; architect, J. Ough; contractor, J. White; cost, $6,000.

Two-story and basement frame dwelling on N Street, between Eleventh and Twelfth. Owner, C. N. Hartwell; architect and builder, J. Ough; cost $5,000.

German Evangelical Church on Tenth Street, between O and P; architect, A. A. Cook; contractors, Fallner Bros.; cost $3,000.

Two-story frame, brick basement, on Fourth Street, between N and O. Owner, Chas. Sellinger; architect, N. D. Goodell; contractor, J. White; cost, $3,500.

One-story and basement frame, on Twenty-first and H. Owner. A. Kuhn; architect, N. D. Goodell; contractor, J. White; cost, $1,000.

One-story frame on Twenty-third, near F. Owner and builder, J. Middlemiss; cost, about $650.

One-story frame on Nineteenth and M. Owner, A. T. Driver; builder, —— Traynor; cost, $900.

One-story and basement frame dwelling on Sixteenth and N. Owner, F. Schnouff; builders, Vandercook & Murdock; cost, $2,000.

BERKELEY.

Three-story frame, brick foundations, on Atherton Street. Owner, Harmon Seminary Company; architect, G. C. Meeker; contractor, R. McKillican; cost, $18,000.

One-story frame corner University Avenue and Walnut Street. Owner, J. H. Atchinson; contractor, C. R. Lorl; cost, $1,800.

Two-story frame building. Owner and builder, Geo. A. Embury; cost, $2,000.

One-story frame on Shattuck Avenue. Owner, Mrs. F. Clark; contractor, A. H. Broad; cost, $800.

Two-story frame on Shattuck Avenue. Owner, Samuel Wakehani; contractor, A. H. Broad; cost, $1,500.

One-story frame on Audubon Street. Owner, Chas. Hedges; contractor, A. H. Broad; cost, $2,600.

Large green house on the grounds of Capt. Ainsworth; architects, Matthews & Son; cost, $10,000.

SEATTLE.

Three-story frame building, brick basement, on corner of Fifth and Spring Streets. To be used for a hospital, and owned by the Sisters of Mercy; contractors, Wright Bros.; cost $17,000.

Two-story brick building on corner Commercial and Washington. Contractor, John Keenan; cost, $16,000.

Two two-story frame dwellings corner Second and Senaca. Contractor, D. B. Jackson.

ALAMEDA.

Three one-story and basement frame dwellings on corner of Oak and Alameda Avenue. Owner, J. Maristaney; architect, C. F. Mau; cost, about $6,000.

One-story and basement frame on corner of Buena Vista Avenue and Minturn Street. Builder and owner, J. J. Stachler; cost, $800.

Two-story frame corner Walnut and Central Avenue. Owner, Henkel; contractor ——Dencke.

One-story cottage on west side Pearl Street, between Central and Encinal Avennes Owner, C. P. Robinson; builders, Gilbert & Brown; cost, $2,000.

One-story and basement cottage on Railroad Avenue, near Webster. Owner, A. Hoffman; cost, $2,000.

One-story frame dwelling on Pearl Street, near Central Avenue. Owner, E. J. Robinson; cost, $1,600.

Two-story frame residence on Central Avenue. Owner, Mrs. M. E. Farvis; cost, $3,400.

WOODLAND.

One-story frame building on corner Second and Lincoln Avenue. Owner, —— Culver; contractor, Joe Caldwell; cost, $1,950.

One-story frame building on Second Street. Owner, —— Green; contractor, Amsberg & Co.; cost, $1,700.

One-story frame on North Street. Owner, Mr. Garoutte; contractor, W. Carson; $1,675.

The old Masonic Lodge is being altered into a lodging house; day's work; cost, about $500.

Frame building for wagon-shop. Owner, F. Knox.

Frame dwelling. Owner, C. H. Garoutte; contractor, W. H. Curson.

LOS ANGELES.

Two-story and attic frame dwelling. Owner, Hon. J. F. Crank; architects, Curlett & Eisen; day's work; cost, $15,000.

STOCKTON.

The building on the corner Main and California is being altered so as to be used for a theater. Owners, Southworth & Humphrey; architect, Chas. Beasley; contractor, Carle & Croly; cost, $11,000.

One-story frame on California Street. Owner, H. E. Stoetzer; contractor, A. Ehmann; architect, H. Geilfuss; cost, $1,500.

PORTLAND, OREGON.

First National Bank is erecting a large brick building; architect, Clinton Day; cost, $75,000.

CALISTOGA.

Frame dwelling and stable near town. Owner, A. L. Tubbs; architect, Clinton Day; cost, $18,000.

OAKLAND.

Two frame cottages on Market, corner Fourteenth. Owner, —— Parize; contractor, A. Herbst; cost, $3,000.

Two-story and basement frame on Clay, between Fourteenth and Fifteenth. Owner, Dr. Reilley; contractor, J. E. Hannah; cost, $3,000.

Four one-story and basement frames on corner East Twelfth and Second Avenue. Owner, C. L. Taylor; architects, Taylor & Copeland; contractors, Hitchcock & Bandin; cost, $7,500.

Repairs to frame building on Broadway, opposite Fourteenth. Owner, F. Blake; day's work; cost, $1,000.

LINCOLN.

Two-story frame building. Owner, Henry Nader; architect, N. D. Goodell; contractor, J. White; cost $3,000.

EUREKA, H. B.

The Odd Fellows are erecting a new building. Contractor, Jas. Simpson; cost, $18,500.

Work Manuals.

The intention of the publishers is to give in this series a number of small books which will give thorough and reliable information in the plainest possible language upon the

ARTS OF EVERY-DAY LIFE.

Each volume will be by some one who is not only practically familiar with his subject, but who has the ability to make it clear to others.

The following are the titles of the volumes:

1. Cements and Glues.
2. The Slide Rule, and how to Use It.
3. Hints for Painters and Paper-Hangers.
4. Construction, Use and Care of Drawing Instruments.
5. Plaster: How to Make and How to Use It.
6. Rules, Tables, Data and Memoranda for Mechanics and Others. (Part 1.)
7. Rules, Tables, Data and Memoranda for Mechanics and Others. (Part 2.)
8. Construction and Use of Saws, (with directions for filing, setting, etc.)

The volumes each contain from 50 to 75 pages, neatly and clearly printed on good paper and bound in tough and durable binding.

PRICE, 25 CENTS EACH.

Nos. 1, 2, 3, are now ready, and the others will shortly follow. Send to this office.

Publication Notices.

Building Prosperities.

During the current year, a fairly prosperous condition of things has existed in San Francisco, in connection with the building interests. Although no very large or costly commencements have thus far been made, there has been a gratifying number of moderate-class buildings for business and residence purposes; many more in number during the past three months than have been recorded within a similar period since the commencement of this journal, in 1879. We are pleased to notice that the daily journals of San Francisco have not, during the current year, run into enthusiastic but unsustained statements, crying *boom*, when, in reality, no boom has existed. The interest of San Francisco will be as well or better served and enhanced by unexaggerated statements, than by any system of inflation that can be resorted to; as candid and reliable men are seldom influenced by representations which carry upon their face the impress of improbability or excess. There are, however, quite a number of important building movements nearing commencement, and the prospects indicate a lively building trade during the year. There has already been sufficient work started to engage all the skilled workers in wood, and it has been difficult for some of our prominent contractors to supply themselves with competent workmen. And the supply of certain kinds of building materials has been exceedingly limited, that of lime being subject to orders, with delays in delivery in numerous cases of from five to twenty days. An advance in the price of skilled and unskilled labor has been general in all lines of mechanical operations in connection with house building; and a material advance in the price of plastering-work rules, with no probability of a decline. In fact, present prices for plastering-work should be fully sustained, as during the three or four years preceding 1881 a cruel, unwise, and demoralizing competition prevailed among plasterers in San Francisco, to such an extent that it became difficult for architects or owners to obtain fair work, because, as if by common consent, or from determined purpose to oppress each other, plasterers so thoroughly depressed prices among themselves, that but few did better financially than make both ends meet, while the greater number were unable to pay their bills, and were compelled to liquidate indebtedness by partial or *pro rata* settlement; and many others departed suddenly but quietly, not considering their indebtedness, nor the wishes or claims of their creditors a sufficient bar to their going.

Applying the prices which ruled during the "terrible depression," some owners argue that the "present is an expensive time to build." But this is a mistaken conclusion. Present prices average less in many respects than they were prior to the commencement of the sand-lot era; and with few exceptions, are not in excess of fair and legitimate profits. There is a class of owners of real estate, and people generally, who never willingly pay fair and right value for anything. Avarice and extreme selfishness drive from them all consideration of equities between person and person; and any and all propositions which do not present special advantage to them are rejected; or, if circumstances enforce acceptance, a feeling of dissatisfaction ensues, for no other reason than that the transaction divides the equities, giving to both payee and payor right and proper compensation for money, labor, materials, and things, exchanges "in consideration," etc. But this does not suit some people, and thousands of building lots remain vacant from year to year, because their owners cannot find some one who will improve the same at a cost of ten to forty per cent. less than the improvement is fairly worth.

But there is a great number who neither seek nor desire to avoid the payment of right prices for what they have done, as is shown by our monthly report of building intelligence; which reveals the fact that buildings are being erected in all parts of the city, and largely for "private residences," which strongly indicates permanency of purpose on the part of their owners.

There can be no better evidence of universal prosperity in San Francisco and all parts of the Pacific Coast, than the fact that not only every qualified draughtsman is employed, but the lesser kind are utilized to the extent of their abilities, so that there is no surplus of draughtsmen of any class in San Francisco, while we are in receipt of letters from Los Angeles, Santa Barbara, Oakland, Sacramento; Portland, Walla Walla, etc., requesting us to "send draughtsmen." But we have exhausted the names upon our draughtsmen's registry, and can fill no more orders at present. We mention this simply as a fact, and not for the purpose of causing the immigration of draughtsmen from other places. There has heretofore been a large surplus in this line, and should there be a decline in present activities, the home supply will equal the demand.

San Francisco Chapter of Architects.

The regular monthly meeting of the chapter was held the 2nd inst., President Wright in the chair. The attendance was good, and a lively interest manifested in the business of the chapter.

A deputation from "San Francisco Union No. 22, of the Brotherhood of Carpenters and Joiners of America," was present, and laid before the chapter an address, in which the objects and purposes of the Union were set forth, and asking that the members of the chapter use their influence and professional authority in furthering the objects of the Union. The address was read before the chapter by a member of the delegation, after which it was received by the chapter, and referred to a committee of three, consisting of Messrs. Wolfe, Sanders, and Mitchel.

Mr. Albert Pissis, having been duly proposed at a prior meeting, was elected a member of the chapter.

Propositions for membership were received, and referred to a committee, as provided in the by-laws.

The President, Mr. John Wright, then read an address, containing many suggestions of interest. We publish it in full in this issue.

A special meeting was called for June 9th, for the purpose of considering the constitution and by-laws, as per amendments of the committee.

Superficiality.

It is sometimes amusing to contemplate the frills put on and the self-importance assumed by a class of persons who, having gained a limited amount of knowledge in any special pursuit, *imagine* that they, more than any other within similar range of opportunities, have become proficient in matters which in their very nature and extent defy comprehension and conquest except by long years of diligent application, devotion, and study.

Young men of flighty ambitions, soaring far beyond the limits of natural abilities, more frequently fall into this unfortunate error, accepting the superficial rather than by patient and diligent application aiming and pressing on until the really substantial and practical is secured. This specialty of character is to be found in all trades and professions, with much more of injury than benefit to any. Very frequently, after a short or moderate term of instruction or service as student or apprentice, the taught arrogates a knowledge greater than is accorded to the teacher. Consequently, the world is full of self-conceited, incompetent, and unqualified pretenders in all lines of pursuit, who, to gain even a moderate degree of success, must resort to methods, schemes, tricks, deceptions, and fraudulent devices, to make appear something seemingly meritorious. And this system of misrepresentation and falsification has become monstrous in proportions and magnitude, because the masses *practically* prefer being deceived. Plain, fair, and faithful representations of facts and things are appreciated only by a few, as compared with those who are better pleased when the embellishments of excessive statements and high colorings are added. And this gives vitality and zest to those who make their way through life by resort to deceptive practices; for, as the possession of gold is the main object of life with infinitesimally nearly all mankind, there are but few so conscientiously scrupulous as to reject any proposition around which golden "eagles" hover.

History of the "Lost Arts."

For some time past we have been engaged in the work of collecting information in regard to the "Lost Arts." The result of delving into the secrets of the past will appear shortly in these columns. We would be under obligations to any one who will aid us in this work by forwarding us items in connection with the above subject.

A $20,000 "Outside Ladder" Suit.

A suit for damages has been commenced in the Superior Court of San Francisco by Charles Kropp, against C. M. Mason, who for cause of action states, in effect, that the said Mason owns three houses on Seventh Street, and the roofs being in leaky condition, defendant engaged plaintiff to make said roofs water-tight. The means of ascent to said roofs was the usual dangerous and unsafe "outside ladder," so universal in connection with nearly all moderate cost houses, and many of no mean pretentions. We notice this particular case as illustrating what has several times been stated in this journal as likely to occur, and which we again repeat will be of frequent occurrence hereafter, as time and weather perform the work of destroying the fibers and strength of the wood, and rust and corrosion eat away the *few* nails employed in making these destined to be neck, back, and limb breaking ladders. It is simply preposterous for any one to assert that pieces of 1x3 inch lumber, gained into 2x3 or 2x4 inch uprights, and nailed to the perpendicular walls of a building, are sufficient and safe for ascent for any considerable length of time, particularly when there is no more mechanical judgment and care exercised than is practiced in a majority of cases in making and putting up "outside ladders"; in which the "gaining in" is imperfectly done, and no special attention paid to the nailing.

The result of the case mentioned will be one of interest to property owners, and mechanics and others employed to ascend roofs by the risky contrivance adopted so generally in this city. Should Mr. Mason be mulcted into $20,600.50—the sum sought to be recovered by Mr. Kropp—it will establish the responsibility feature of "outside ladders"; and if the plaintiff fails to recover, it will be a lesson to those who may hereafter be engaged by owners to risk their lives and limbs upon climbing perpendicular *dead-falls* nailed to the sides of buildings, for the purpose of performing roof or other work, to reach which no *safe means* of access is provided by the owner. The mere thought of a man, particularly if well-fed, healthy and weighty, climbing perpendicularly up the side of a building, with only *four* 10*d*, 8*d*, and sometimes 6*d* nails between him and a broken back, neck, leg, or eternity, is sufficient to cause a feeling of horror to pass through those who have any regard for the safety of their fellow-kind.

Where are our Draughtsmen Gone?

During the past three years, a single intimation from an architect that a draughtsman was wanted would have brought to his office numerous applications for the position. In fact, he would have had several, the qualifications of whom could have been tested before engaging their services. Now it is an impossibility to engage even a very ordinary draughtsman at advanced remuneration. The question naturally arises, Where have they all gone? We can answer the question, satisfactorily to ourselves at least, by looking at the numerous applications on our secretary from architects in Santa Barbara, Oakland, Sacramento, Portland, Walla Walla, etc., all desiring the services of a competent draughtsman. From this fact, we conclude that the demand in the country has absorbed all our draughtsmen whose services were not permanently engaged. We received a long telegram from an architect who desired a competent man in his office, agreeing to pay his fare, but we have been unable to fill the order.

This state of affairs, more than anything else, shows the prosperity that is dawning upon our State. The scarcity of draughtsmen, proving that most of our architects are busy, will show to our carpenters, masons, material men, laborers, etc., that this year, at least, need not have an idle day to their account.

The Designs and Models of the Garfield Monument.

In another article in this issue we refer to the generally admitted failure of the committee having the matter in hand, in obtaining a design for the Garfield Monument, so artistic and meritorious in design, fitness, general character, and detail, as to compel adoption *per force* of intrinsic merit.

The criticisms of the press and public have been anything but complimentary to those engaging in the competitive contest, and mainly so because the committee FAILED TO DESTROY ON FIRST SIGHT some of the wretched burlesques upon the designer's act submitted. Perhaps a *majority* of the presentations should have been consigned to the waste basket, as not possessing a single pleasing or artistic feature.

Had this been done, it would, to some extent at least, relieve the few better designs (one of the best of which appears in this issue of this journal) of the unfavorable influence created by the presence of so many lamentable failures to combine and twist into some new form and shape features common in all cemeteries, and illustrated in hundreds of printed designs for monuments contemplated or erected.

The good and beautiful in part if not as a whole, as represented in some of the better designs, was largely overshadowed by the many inappropriate and almost comical attempts; and the disappointment at seeing so many subjects of ridicule and so little to admire created a sentiment of disfavor to all. That there is merit in some of the designs and models cannot be denied, and if the more meritorious only had received a second consideration the prevailing adversity of judgment and public opinion would have been greatly modified, and criticism toned down to a milder tenor.

Some of the gentlemen submitting designs deserve more credit than they have received in this connection, as far as personal abilities, talent, and honesty of purposes are concerned; and the case as it stands is simply another exemplification of the danger of being found in bad company. A much more favorable impression would have been made for the better if the worst of the designs, the wretched abortions, had been kept from view.

This case presents another strong argument in favor of that rule of the Chapter of Architects which reads: "*Architects accepting should receive a true and definite list of those against whom they are to compete*, and should also be paid a reasonable sum for their services, according to the extent of the work, whether successful or not."

This provision suggests a reformation in the very unfair practice hitherto adopted by committees, of making their invitations too general and opening the door to all, thus placing the veriest pretender and fraud, practically on the same footing with intelligent and competent men; while if careful discrimination was made the rule, and when something fine and artistic was required, selecting those of acknowledged competency and abilities, and offering them right and proper compensation, and closing the doors against the many who, under a general opportunity, rush in for the purpose of worming their way into public notice.

The whole system of competitions for designs as generally practiced is entirely wrong and unjust; and if the architects of this city were a unit in behalf of their own best interests in this and numerous other respects, every man of them would unite in the noble work now being done by the San Francisco Chapter in reforming abuses, and elevating the profession to its proper and rightful standing, position, and influence.

An Exceptional Picnic.

Although picnicking is no part of architectural, mechanical, or any other science, we cannot permit the occasion to pass without noticing the really grand picnic ovation given by Whittier, Fuller & Co. to their employees, and nearly, if not quite, three thousand invited guests additional. If it had been an ordinary affair, with a few miles' ride in the cars, a little music, a few dances, a considerable or large amount of drunkenness, etc., it might be passed without notice. But in view of the fact that the firm provided more than thirty cars—two well-filled trains, requiring several locomotives to bear the happy mass of humanity over the road, together with all reputable things usual on picnic occasions—of music, banners, dancing, etc., they transcended all ordinary bounds; first, in in the presentation of a Japanese parasol to each lady present on the train, which was followed by printed programmes of games, dances, etc., very handsomely executed; and these by the presentation of printed numbers to each lady, entitling the holders of lucky numbers to prizes; and these by the gift of fans—all demonstrating a degree of liberality seldom met with. And to all this was added the prohibition of all intoxicating beverages, so that when the hour of return to San Francisco arrived, every head was clear and steady; and the day, beautiful in its clear sunshine, invigorating in its sweet and balmy breezes, was spent without a single marring incident, except the sore limbs, sprains and bruises which generally happen to some of those who seek glory, fame, and the first prize, by contest in the usual running and other games provided for such occasions. The picnic to Turner's Park, Redwood City, will be long remembered by others beside the employees of Whittier, Fuller & Co.

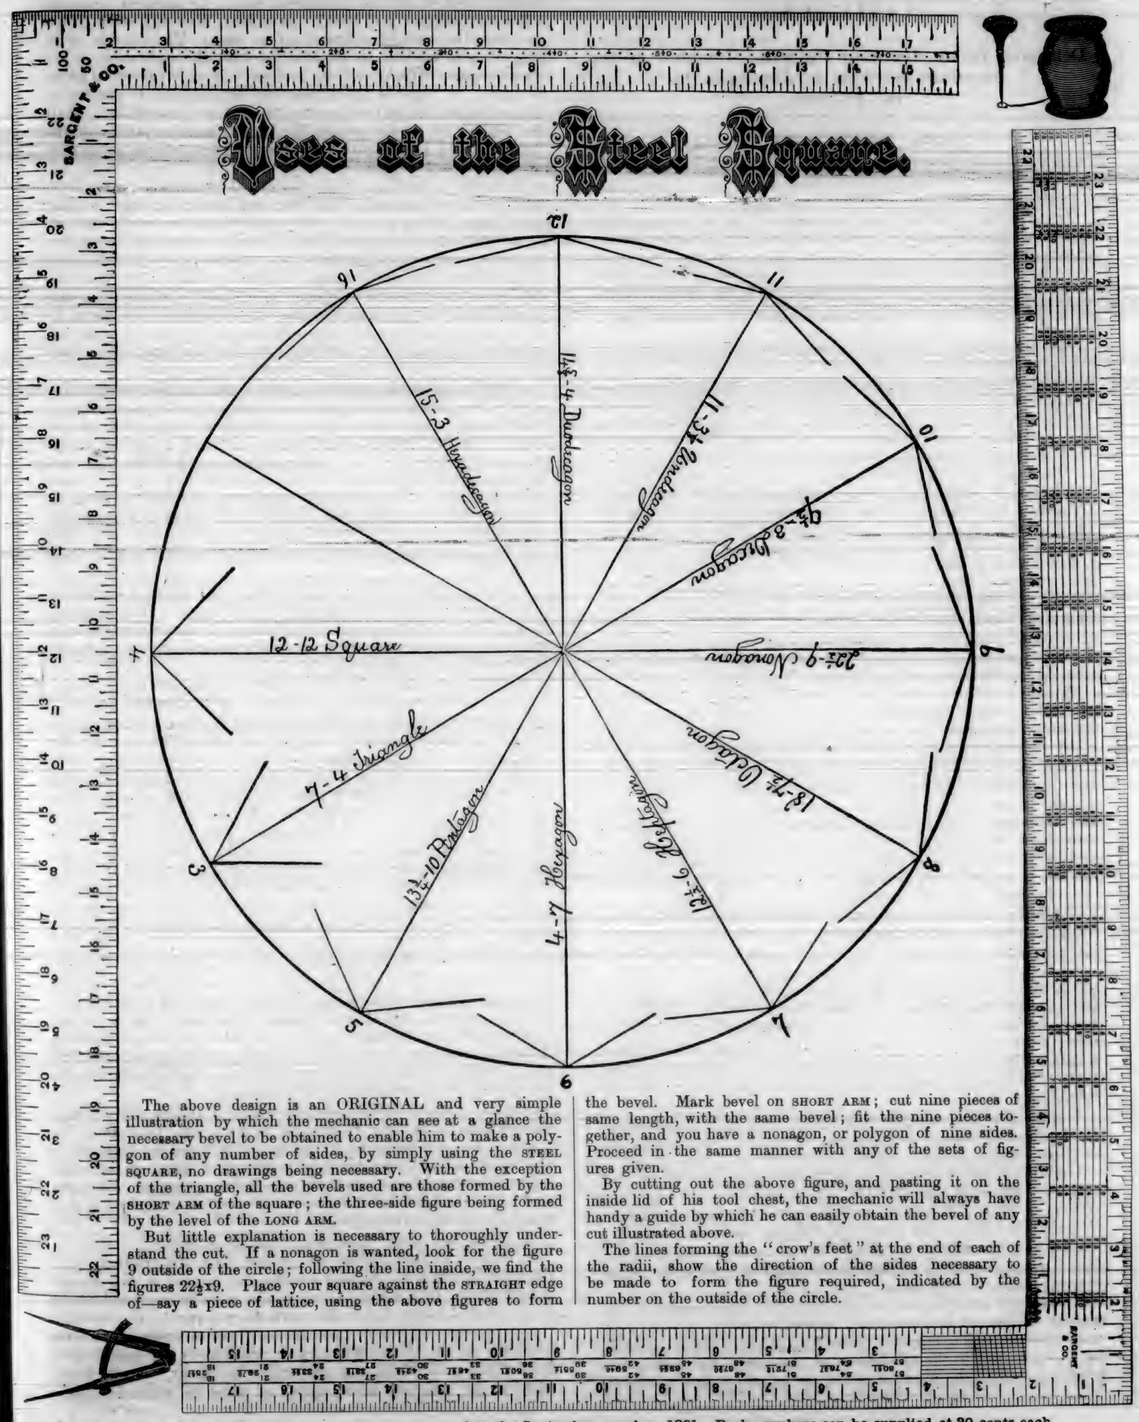
To Make Brick Walls Water-Tight.

The Sylvester process and its results are described fully by Mr. Dearborn in a paper read by him before the American Society of Civil Engineers, May 4th, 1870.

The process consists in using two washes or solutions. The first composed of three-quarters of a pound of castile soap dissolved in one gallon of warter, laid on at boiling heat with a flat brush. When this has dried, twenty-four hours later apply in like manner the second wash of half a pound of alum dissolved in four gallons of water. The temperature of this when applied should be 60° to 70° Fahr. After twenty-four hours, apply another soap wash, and so on alternately until four coats of each have been put on. Experiments showed that this was sufficient to make the wall water-tight under forty feet head of water.

At the time of application the walls had been saturated and the weather was cold. The gate chambers were covered over and heated thoroughly with large stoves. The drying, cleaning the walls with wire brushes, and applying the the mixture took ninety-six days. Twenty-seven tons of coal were used for the drying and one ton for heating the soap solution. Eighteen thousand eight hundred and thirty square feet of wall were washed with four coats. The drying and cleaning of the walls costs six and a half cents per square foot, and the plant, materials, and labor of applying the wash cost three and three-eight cents per square foot.

The vast fir forest of Puget Sound is thought to be the finest tract of valuable timber land in the world. It covers an area of about 32,000 square miles, according to the rough estimates current in the Territory. It is accessible from every point of the Sound, and from the ocean coast for a vast distance southward.



The above design is an ORIGINAL and very simple illustration by which the mechanic can see at a glance the necessary bevel to be obtained to enable him to make a polygon of any number of sides, by simply using the STEEL SQUARE, no drawings being necessary. With the exception of the triangle, all the bevels used are those formed by the SHORT ARM of the square; the three-side figure being formed by the level of the LONG ARM.

But little explanation is necessary to thoroughly understand the cut. If a nonagon is wanted, look for the figure 9 outside of the circle; following the line inside, we find the figures 22½x9. Place your square against the STRAIGHT edge of—say a piece of lattice, using the above figures to form the bevel. Mark bevel on SHORT ARM; cut nine pieces of same length, with the same bevel; fit the nine pieces together, and you have a nonagon, or polygon of nine sides. Proceed in the same manner with any of the sets of figures given.

By cutting out the above figure, and pasting it on the inside lid of his tool chest, the mechanic will always have handy a guide by which he can easily obtain the bevel of any cut illustrated above.

The lines forming the "crow's feet" at the end of each of the radii, show the direction of the sides necessary to be made to form the figure required, indicated by the number on the outside of the circle.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

ADDRESS.

Delivered before the San Francisco Chapter of the American Institute of Architects, by the President,

JOHN WRIGHT, ESQ.

GENTLEMEN—While I feel sensible of the honor you have done me in electing me President of the first Chapter of the American Institute of Architects established on this Coast, and for which I return my sincere thanks, I also feel that the office is no sinecure, and that to properly fulfill the duties of the position might well tax abilities far beyond those to which I can lay claim.

But not to waste words in mere preliminary formalities, I will at once address myself to the task of reviewing the work already accomplished during the past year by the Association lately brought to an end; and will endeavor to sketch out, as briefly as I can, and submit for your consideration, something like a system by which it seems to me our Chapter may be made most useful for the future: first, to the public; second, to the rising generation who are so soon to take our places; and lastly, to ourselves as responsible members of the profession, for I hold that no efforts put forth in the interest of the general good ever fail to redound in most abundant measures to those by whom the effort has been made.

First, then, I submit that during the past twelve months we have made substantial progress in accomplishing the objects for which our Association was formed. As the forerunner of a Chapter, it was necessarily preliminary. The work it had to accomplish was that of preparation and formulation, and, as the event proved, was probably better accomplished in that way than by the formation of a Chapter at that time.

True, our numbers are yet limited; there are more of the profession outside our borders than within, many of those whom we would gladly hail amongst us, and who could most worthily assist us in the objects for which we are associated, still hold aloof from us, and many of those who would themselves be greatly benefited by taking part with us, fail to see their way to joining our ranks. Be it our part to conciliate the one class, and encourage and invite the other, to the end that with the association of numbers our influence may increase and extend, and by the harmonious and united action of a powerful body, the truest and highest principles of professional practice may be promoted amongst ourselves, as well as the efficient and faithful observance of those same principles in our respective dealings with the public, and which, after all, can alone justify our corporate existence.

During the year six of our number have been elected Fellows of the American Institute of Architects, and together with our late President constitute a fellowship of seven. We have lately formed a chapter in connection with the above body, the first on the Coast, to be followed, let us hope, by many others, as State after State develops and progresses in science and art under the fostering influences of prosperity, civilization, and refinement.

During the year, also, an experiment has been made which demands more than passing notice, and which I mean to make the text for the remarks which follow.

I allude to the successful inauguration of a system of competitions amongst the architectural students of the city and vicinity. True, this was of a very limited character, and participated in by but few; but the designs received evinced a degree of merit hardly to be hoped for in a first trial, and certainly worthy not only of commendation, but systematic development and encouragement.

The theory and practice of art, united in the person of the master builder of old, produced works which succeeding ages may hope perhaps to emulate, but never to excel, unless, indeed, by a return, not to the conditions of the past—for that is impossible—but to the practice of similar principles and methods, though worked out in a different way. In modern times the office of designer and builder have been divorced, with consequences exceedingly detrimental to each. The former is no longer, as in ancient times, charged with the execution of his own designs. His knowledge and experience is therefore likely to lessen as regards the adaptation of materials to special or general purposes, and to become more or less superficial; while the builder, no longer responsible for the artistic quality of the design which he executes, has less and less scope as well as encouragement for the development of knowledge, taste, and skill in the execution of his work. How utterly wrong is all this, and how impossible for either the one or the other to succeed in producing a satisfactory result! Again, while the arts of printing and photography have been instrumental in rendering all who desire it familiar with almost every architectural structure of any note in the civilized world, there has been developed an excessive tendency nowadays to adopt the forms of art, without regard to the materials in which they are to be embodied, together with an indiscriminate selection of details of every age and style, without regard to the simple principles involved in their origin, growth, and development.

Speaking professionally, the greatest need of the present day is, first, true taste and accurate knowledge of art in the designer, united with a thorough knowledge of materials and their proper adaptation to truthful construction; second, a public whose educated tastes will detect and condemn every subterfuge, and whose sense of the *ideal* will be satisfied only by the *real*; third, a system of professional instruction for our students or young designers which shall educate teachers as well as taught, and which in effect shall be practical, sufficient, and sure, and which shall embrace not only the highest but the lowest level of the art.

Assuming these three propositions to be granted: with regard to the first, I would suggest that at every regular meeting of the Chapter, papers should be read on the exceedingly varied and instructive topics with which the general theme of Architecture so greatly abounds.

We live in an age of vast development of the material sciences; and the importance of their judicious application and economical adaptation to the endlessly varying wants of constructive design furnishes a never-failing source from which to draw for a subject.

The best methods of construction, past and present, with such suggestions of still greater improvements as may from time to time occur. The questions of interest surrounding the subject of *plan*, with its developments, historical and national. The great question of a universal style, parallel to that still greater problem, that of a universal language to which it bears a large anology. The development of a truthful treatment of material in construction, before alluded to, and an equally important matter, the adoption of the most substantial of materials, though attended, it may be, with a sacrifice of mere meretricious ornament which possesses in itself neither use, beauty, nor meaning. Then the question of ornament itself, and its proper treatment in harmony with the material in which it is to be executed. All these, together with many others too numerous here to particularize, might be taken up as specialties by different members of the Chapter, and pursued systematically; and, if followed by discussions and criticisms, would doubtlessly prove eminently beneficial to all concerned.

For the general public, who are apt to imagine that on matters architectural their knowledge is complete, periodical lectures would probably be of great use in arousing interest in the many subjects in which the public have so much at stake, as well as establishing in their minds true principles of taste, and a just and critical judgment as to what constitutes true beauty in architectural design.

Thirdly, and most important of all, the students.

It is evident that unless our young men are gradually prepared by intelligent training to take our places in the professional ranks, that either those ranks will be replenished by raw recruits unfitted for the work they have to do, or that foreign talent, of which there is so great an abundance ever pressing at our doors, will step in and supply the public need in designing our dwellings and public buildings, thereby fixing upon us the national peculiarities of style to which its representatives are respectively most attached—generally at variance with the prevailing characteristics of our national taste, and ill-adapted to our climatic requirements. At the best, we shall possess but a feeble and soulless jumble, ever varying with the latest importation of professional taste.

How much better that our young men should be thoroughly furnished through careful study and assiduous training, by the best and most practical methods within our and their reach; so that they may themselves supply the public demand, and by harmony of effort and unity of thought strive to found and establish on this Pacific Coast a school of our own, which shall be free from the inherent defects which a variety of foreign styles and methods of building are sure in some degree to possess. To this end, I beg to make the following propositions, to be followed by such action in the premises as in your good judgment may be deemed best.

First. To establish a free class for architectural students belonging to the Chapter. The class to be instructed by members of the Institute who shall take up such special branches of study as they may consider themselves best fitted to impart, and who shall give their services free of charge.

Second. That the system of study and reading, which may be arranged in harmony with the above, be supplemented by periodical competitions among articled students.

Third. That at the end of three years, a six months' traveling studentship, providing for a tour in the Eastern States and Europe, be established; the privilege of which shall be given to the student obtaining the prize in a competition to be held at that time; the expenses of said student not to exceed say six hundred dollars, and to be paid out of a fund created by the fees of life members. Such fees to be invested as a nucleus of a fund to be kept sacred for the above purpose. In case the interest of said fund be found insufficient for the purpose, the balance to be paid by the Chapter.

The result of some such course would be a systematic study of styles and modes of construction, historical and national, from the best models and under the best available tuition, thus rendering the student familiar with the development of the art from the earliest times. Also the comparative study of real buildings as a final preparation for the chosen work of his life, the success of which would be almost assured by such a conclusion of his arduous study. And lastly, the placing of a sufficient inducement before the student to lead him to devote himself with earnestness to the work before him.

Strikes as a Symptom.

Nearly every class of workmen employed in the building trade in New York City have been engaged of late in striking for higher wages. In most cases, through the thoroughness of their combinations, they have succeeded in attaining their object. The great activity in building which has prevailed during the past two years has brought into requisition a large force of mechanics and laborers, and given them steady employment at wages that are almost unprecedented. They have shared fully in the prosperity of the trade. So long as the business continued active and profitable, the demand for good workmen and competition among employers insured a normal advance of wages, and there was no intimation of strikes. But latterly there have been premonitions of a check in building operations. There have been symptoms of a danger of overdoing. The rise in wages and in the prices of material has so advanced the cost of building and pushed up rents that the limit of an effective demand appears to be reached, if, indeed, it is not already passed. Accordingly, employers begin to feel compelled to resist applications for still higher wages. It is only when that point is reached that strikes begin. But the first symptoms of a falling off in the demand for new buildings do not operate at once to check the work already going on. The men are still busy, and existing contracts must be completed, and, consequently, strikes are likely to be successful at first. The carpenters, the joiners, the masons, the stone-cutters, the painters, the plumbers, and all the rest of them have their unions and associations, through which a stoppage of work may be effected. The builders are anxious to complete what they have in hand and to fulfill their present contracts as speedily as possible, and so they are apt to yield to avoid embarrassment.

But notwithstanding the success of most of the strikes in the building trade, their action may, nevertheless, be in conflict with their own best interests. It gives another turn to the screw which is checking the operations upon whose activity they depend. It adds another item to the cost of building, gives another pressure to the rents that are already resisted, and strains the expense of living to a higher degree. The probable effect of this will be to produce a reaction in the building trade and a period of comparative dullness. When people refuse to pay such high rents and feel unable to buy such costly buildings, there is no alternative but to stop building or to build cheaper. Then employers will be obliged to pay lower wages or to discharge their workmen. When that time comes there will be strikes against reductions, but they will not be successful, because builders will be in a position to dispense with a certain amount of labor without loss, and the force of competition will be thrown among the workmen themselves. They will be idle part of the time, they will be compelled to accept lower wages when they work, and if they are intelligent and thoughtful they will realize that they contributed, by their persistent demands, quite as much as venturesome capitalists to the reaction that followed their season of prosperity.

Labor unions, when used as an instrument of coercion to force wages beyond the level which employers would be induced by self-interest to pay, contribute to the violent fluctuations to which our material prosperity is subject. They prevent the free play of the influences of supply and demand at just those critical times when they should effect an easy adjustment of industrial forces. By insisting upon carrying wages too high, and keeping them up too long, they compel an abrupt check upon activity, and a positive depression, when an earlier but more gradual slackening would have brought business into an equable channel of normal progress. Our industries are subject to violent ups and downs. When prosperous they are apt to be "booming." Prices go too high, wages insist on closely following them, and when the inevitable overdoing is reached there is a reaction, and labor suffers first and most. Strikes rarely occur on the rise, but generally at the turn and on the fall. They are not a symptom of prosperity. When the market is active, and prices good, every reasonable demand of workingmen is generally granted, and cannot be long refused. It is when the demand for products, of whatever kind, falls off, supplies accumulate, and prices begin to go down, that employers pause, refuse to advance wages further, or feel compelled to reduce them. Then we hear of strikes; strikes in factories, in mines, and in the trades. They indicate a check in prosperity, perhaps an impending reaction, possibly a coming depression, and among the forces that make these violent or severe are labor combinations, which prevent a normal adjustment of one of the most important elements in industrial operations.—*Carpentry and Building.*

If the abolition of fencing were a possible measure of economy, the nation might speedily enrich itself by turning that outlay into an available form. It is reliably estimated that the total cost of fences in the United States is equal to the national debt. The State of Indiana alone has 344,000 miles of fence, which is presumed to have cost not less than $100,000,000.

Erecting Wrought-Iron Chimneys.

A novel plan for erecting the castings of fire-brick hot-air stoves and wrought-iron chimneys is being pursued at the Pennsylvania Steel Works, Harrisburg. Two new blast-furnaces, with six Whitwell stoves, 60 feet high and 18 feet diameter, are in course of erection there. Instead of putting the bottom plates of the stove together on the ground, and building the rings up from the bottom to top, at the works mentioned a commencement is made with the top plates and top ring of the stove. They are first erected on the ground, and riveted and calked complete; then with three very large screw-jacks, having a lift of about six feet, and placed at equal distances around the site of the stove, worked by men with winch-handles, this first ring is carefully and evenly lifted high enough to enable the workmen to put on the next ring of the plates, five feet deep. This ring is also riveted and calked complete; then another ring is added and lifted, and so on till the whole stove is completed. The wrought-iron chimney, 175 feet high, for working these stoves, was erected in the same way.—*Iron.*

Ivy.

Who does not remember the town-loving old lady who expressed her horror of a country life "because the ivy made all the houses damp!" The old lady did but express the common idea upon the subject; but it is a very erroneous idea nevertheless. The attachment of ivy to walls, so far from injuring them and causing dampness, is an advantage. If the walls are dry when planted ivy will keep them so. If damp, as the plant overspreads their surface the dampness will disappear. Where dampness prevails, ivy sucks out the moisture, and its thick foliage will prevent the access of rain to the structure; and thus it is not only a remover, but a preventive of dampness. The only danger attending the planting of ivy on buildings is where fissures occur in the walls, in which case the shoots and roots will enter, and, if left undisturbed, their growth will soon begin to tell upon the building, and will, by increase of growth, push against the sides of the opening, thereby enlarging it, and eventually so weaken the wall as to cause it to fall. Where the wall is sound there is no such danger, for the plant does not make fissures, although quick to discover them.—*Land.*

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

[While this column is open to all, farmers as well as mechanics, engineers as well as architects, we would call particular attention to one and all to have their questions and the information desired to be in accord, as far as possible, with the interests of this journal and for the carrying out of those principles for which the only monthly of its kind this side of the continent, was established. We will endeavor to answer all questions in a fair and impartial manner, and if it becomes necessary, will furnish cuts for the illustrations of any problem, provided we regard the solution thereof as beneficial to the majority of our readers. We would urge upon our patrons the necessity of being pointed in their questions, concise in the language used; let the writing be distinct, and one side of the paper only to be used; give full name and address, and particularly mention if their proper name shall be used.

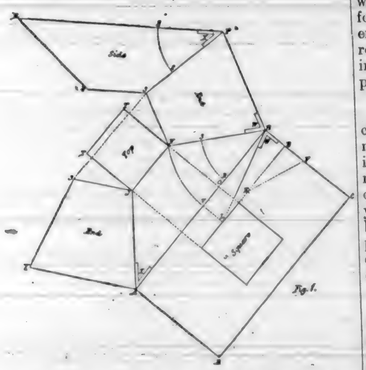
We want it distinctly understood that the responsibility of signed articles rests with the authors.

Correspondents will please direct all communications to the business manager of this journal—240 Montgomery street, rooms 12 and 13.]

BUSINESS MANAGER OF ARCHITECT: Will you please give in your "always looked for monthly" an explanation of the construction of an oblong with slanting sides? I have a flume 4x6 feet in size. At the end of the flume I want to fix on a box 6 feet in depth, so that the opening in the lower end will be 2 feet 6 inches square. What rule will I follow so I can cut, out of sheet iron, the sides and ends so as to have a perfect fit?

G. N. NELSON, Sierra Co.

ANS.—An explanation of the above problem will shortly be found in our articles on the Steel Square and its Uses. Not wishing to anticipate anything that has been mapped out in those articles, we present to our correspondent the method used by R. Riddell in one of his master works entitled "Mechanic's Geometry."



The letters A B C D show an oblong base which is to have slanting sides; these, when together at the top, form a square of any given size, as that shown on base.

Extend upper side of square, cutting at E on the right; make E F equal E B. Now determine on perpendicular hight of sides and ends, say E K; join K F; make O N equal K F, square over N J; join J A and N B; this gives one side of the work.

Next find slant of ends by making B V equal B N; square down from V to L; join L B; this gives bevel W as the cut for ends. The bevel being reversed and applied as shown, gives a direction to draw B P, which make equal B C; draw from N parallel with B P; make N S equal one side of top as N T; join S P; draw from S parallel with N J; make S T on the left equal S T on the right; join S J; draw from A parallel with J S; make A Y equal A D; join Y S. This completes one side and both ends.

To find the side which stands on the base D C, take bevel X already given and apply it as shown at P; or take B for center, and with any radius draw the circle 2.3; with same radius and P center, 2.3; make both circles equal; draw from P through 3; make P R equal A B; draw from S parallel with P R; make S 4 equal S N; join 4 R. This completes sides, ends, and top.

FRIEND BUILDING NEWS: I noticed highly polished saws rust much quicker than ordinary ones. What is the best way to remove the rust when formed on the blades? Living near the ocean I am very much bothered with my saws getting rusted. By answering the above a favor will be conferred on one of your oldest subscribers.

T. S., Ocean View.

ANS.—If very rusty scour first with emery slightly moistened with *dilute* sulphuric acid; rinse well and thoroughly dry; finish with oil and emery flour.

SMELL OF PAINT.—To get rid of this most objectionable odor in a chamber or a living-room, slice a few onions and put them in a pail of water in the center of the room; close the doors, leave the window open a little, and in a few hours the disagreeable smell will have almost gone. Another method is to plunge a handful of hay into a pailful of water, and let it stand in the newly painted room over a night; this plan is also effectual. The foregoing have the important advantage of being simple remedies, as the necessary materials are always easily obtainable. Yet another plan, but it is rather more complicated. Place a grate of lighted charcoal on a piece of flag or slate in the center of the room, and throw on it a handful or two of juniper berries; shut out all ventilation from the room for twenty-four hours. The doors and windows can then be opened, when it will be found that the nasty, sickly smell of paint has entirely gone. The furniture may be left in the room during the process, and none of it will be injured. But the best way to avoid the smell of paint is by not having the painters in the house.

Black walnut can now be manufactured very cheaply. One part of walnut peel extract is mixed with six parts of water, and the wood is coated with the solution. When the material is about half dry a solution of bi-chromate of potash with water is rubbed on it, and then your walnut is ready. Furniture dealers have been known to make excellent walnut from very poor pine, but the difference was slightly perceptible; however, this method is said to defy detection.

An experienced cabinet-maker says that the best preparation for cleaning picture frames and restoring furniture, especially that somewhat marred and scratched, is a mixture of three parts of linseed oil and one part spirits of turpentine. It not only covers the disfigured surface, but restores wood to its original color, leaving a luster upon the surface. Apply with a woolen cloth, and when dry, rub with woolen.

Single vs. Double Tenons.

WORCESTER, MASS., May 8th, 1882.

All other things being equal, which do you consider the strongest, a single or double tenon?

INQUIRERS.

["Inquirers" do not say what their framing is for. Theoretically, a single tenon is stronger than a double one, and its mortise also weakens the timber into which it is framed less than two mortises would. Practically, a double tenon would be used with a joint bolt for drawing the framing together, placed between the two tenons; or it might be advisable to use two tenons to diminish the effect of shrinkage, as for instance in a door, where a double tenon often answers better than a single one.—EDS. AMERICAN ARCHITECT.]

An Improved Bench Vise.

A cheap, convenient, and easy operated bench vise for carpenters' use has been lately patented by Mr. Jesse L. Parker, of Fountain City, Wayne Co., Ind. In the accompanying engraving, which illustrates the invention, A and B are the jaws of a vise, and C is a bench leg provided with a slot, to permit the up and down travel of the vise. A tenoned screw block is mortised into the jaw B, its tenons moving in the bench leg, and its shoulders bearing against the inside of the leg. The upper screw passes into the block through the jaws A B, and draws them together. The screw block also serves to guide the vise up and down in the leg C, and is held at any desired elevation by a lever, catch, and spring, upon the side of the leg. A notched treadle G, designed for holding the lower ends of the jaws in any desired position, passes through and is pivoted to a longitudinally slotted block F, which extends rearward through a corresponding opening in the jaw B. The treadle extends outward from the jaw A, for the convenience of the foot of the operator, and is held in its desired position by a spring on its under side and a catch plate on its upper side. It will be readily seen that this vise may be adjusted to any hight and to any size, with very little trouble to the operator.

Do the Chinese Invent?

Heretofore it has been popularly supposed that the Chinese invented the printing-press, gunpowder, and the mariner's compass. The best authority seems to deny them the honor of these inventions. The Count de Gobineau, in his able "History of the Diversity of the Races," absolutely lays it down that they had nothing to do with these inventions. It is a well-known fact, says Senator Jones of Nevada, that the Chinese have been in a state of general decadence for the last 500 years. Their pottery, their porcelain, and all their other arts are in a very low state compared to what we know they were 500 years ago. They have been constantly deteriorating in arts and manufactures. Prof. Draper, on page 303 of his "Intellectual Development of Europe," says: "The practical Arabs had not long been engaged in those fascinating but wild pursuits when results of very great importance began to appear. In a scientific point of view, the discovery of the strong acids laid the foundation of chemistry; in a political point of view, the invention of gunpowder revolutionized the world." Again, on page 352, "they, that is, the Arabs, also introduced inventions of a more curious kind—gunpowder and artillery. The cannon they used appears to have been made of wrought iron. But perhaps they more than compensated for their evil contrivances by the introduction of the mariner's compass." The late Mr. W. F. Mayers, Chinese Secretary to the British Legation at Peking, a critical Chinese scholar, in vol. 6 of the Journal of the North China Branch of the Royal Asiatic Society, page 82, treating of the introduction and use of fire-arms among the Chinese, says, after noting the Chinese authorities: "As regards gunpowder, therefore, it is concluded that, firstly, no proof of its invention by the Chinese can be adduced; secondly, there is reason to believe that it may have been introduced from India or Central Asia about the fifth or sixth centuries of our era."—*Industrial News.*

PLATE 1.—COMPETITIVE DESIGN FOR THE GARFIELD MONUMENT. ALBERT PISSIS, ARCHITECT.

PLATE 2.—SECOND PREMIUM DESIGN IN THE LATE COMPETITION FOR A NEW HEADING FOR THIS JOURNAL. O. EVERETT, DEL.

PLATE 3.—THIRD PREMIUM DESIGN. V. SCHALLENBERGER, DEL.

Who is to Blame?

THE DESIGNS FOR THE GARFIELD MONUMENT.

It is generally conceded, by those who have examined the designs submitted in competition for the Garfield monument, that none of them reach any high standard of excellence, nor either of them sufficient merit to warrant adoption.

If the committee having the matter in hand have failed—as failed they have—to secure a suitable design for a monument to the memory of our beloved and honored Garfield, there is a reason for such failure; which should serve in the future as a lesson for all similar committees, in their invitations to architects to engage in design and plan competitions. The facts of the case are clearly as follows:

First. While the committee may, individually and collectively, possess and enjoy enviable reputations, and virtues as numerous as the stars in the firmament which surround our earth, still we say to them, as was said to the exemplary young man more than eighteen hundred years ago, "But one thing thou lackest," and that is a *common sense, just and fairly liberal understanding and appreciation* of the worth and value of the services of those who, by unceasing and perpetual study and application, have qualified themselves to combine in thought and conception, and produce in lines and colors, objects truly artistic and beautiful.

This undervaluation of the services of men whose pursuits in life require and receive almost ceaseless thought and attention, very generally running into and absorbing the hours appointed for sleep and rest, is one of great injustice; and is mercilessly imposed in thousands of cases by committees of otherwise good and intelligent men. One thing is very certain: that no one of the gentlemen composing the Garfield Monument Committee would be willing, as an *exclusive business proposition*, to devote as many days and hours, or one-half the amount of deep thinking and study and skillful labor required in maturing and perfecting a *really artistic and suitable* design for the monument in question, for any such sum as that offered as first premiums, unless, beyond such premium amount, there were other inducements of compensating character. And yet these same gentlemen, in the abundance of their *innocence* (!) or decided lack of *knowledge and right understanding* (!) of matters, have sought to secure at half compensation the services of those who have acquired and perfected their professional skill, artistic qualifications, and conceptive attainments, by and through the arduous, critical, and oftentimes severe channels of *absolute devotion*, and unceasing meditation in the mystic realms of thought, from whence come conceptions and visions of beautiful things, to be developed in tangible shape by the mind and hand manipulations of the devotees of the designer's art.

Secondly. It was a decided mistake on the part of the committee, and another striking illustration of their *innocence* (!), in withholding from the successful party the *rightful right* to superintend the practical delineation of his own conceptions. This feature alone would deter many from entering into such contests, as but few competent men would be willing to risk the detail manipulation of their conceptions to others who, perchance, from *lack of ability*, or from *special motives*, might materially compromise beauties and grandeurs, which, under the masterly treatment of the mind and hands which originated the ideal, might be made conspicuous and pleasing.

Thirdly. We know, and state the fact, that many architects and designers of well-established capabilities refused to engage in the competition, upon the grounds and for the reason that they considered the propositions of the committee unfair, and in violation of all those right and equitable considerations which should control in all such cases.

If the committee conclude to adopt either of the designs so far presented, its members will lay themselves liable to severe criticism, as the public generally, and especially those who have donated to the "fund," expect to see a memento worthy the illustrious dead whose memory it is intended to perpetuate.

The withholding of the right from the successful competitor to superintend construction was, to state it in the mildest form, a mistake on the part of the committee, and one which has given rise to many queries and questions as to the purpose of such a course; and to some extent, at least, whether justified in fact or not, created the surmise that a "job" motive may be concealed somewhere. There can be no disputing the fact that the party who conceive and originate a meritorious design, and possesses the artistic abilities to delineate the same on paper, should be the better qualified to detail and superintend its construction. With this as a fact, the question is then pertinent, Why was the superintendence of construction withheld? Many excuses may be *made to fit*, but the appearances are not favorable to spotlessness of purpose; and the committee would have improved their standing before the community had they pursued a course less liable to criticism.

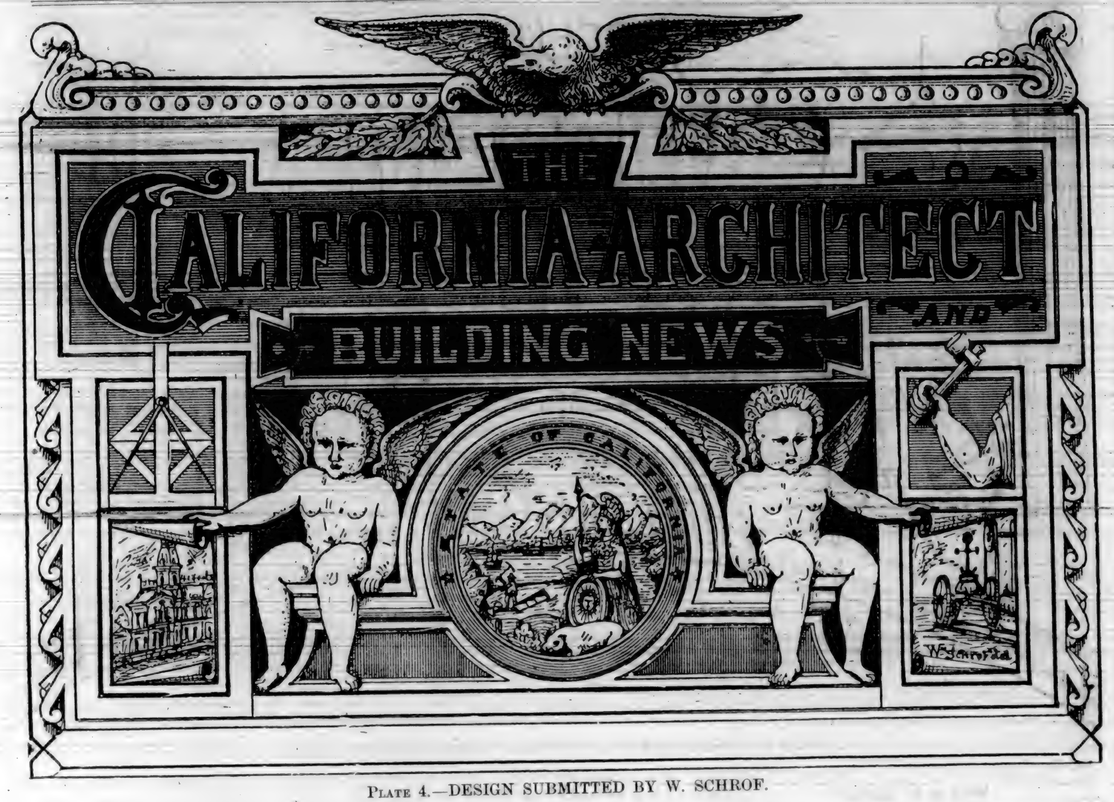


PLATE 4.—DESIGN SUBMITTED BY W. SCHROF.

Our Illustrations.

Plate 1 represents one of the designs submitted for the Garfield monument. It is the work of Mr. Albert Pissis. In another part of this issue will be found our criticism upon the designs.

Plates 2 and 3 received the second and third premiums in the late competition for a new heading for this journal.

Plate 4 is a design submitted by W. Schrof, architect. We leave criticism upon all the designs to our readers and professional brethren, and will be pleased to hear from them on the merits of the respective designs. The accompanying letter from Boston is respectfully dedicated, through the editors of this paper, to the architects and draughtsmen of this city:

BOSTON, May 27th, 1882.

EDITORS THE CALIFORNIA ARCHITECT:

Gentlemen—I am in receipt of your specimen number of the ARCHITECT. I was attracted by the excellent *handling* of the design upon cover, which I consider much superior to its *design*. If the original design was marked with pen and ink the price paid, to wit, $30, as first prize, was, in my opinion, very small compensation for the amount of skill, to say nothing of labor displayed in its execution. Trusting you will receive this as an honest opinion from the other slope,

I am, yours truly,

"ARCHITECT."

Architectural Styles.

The following description of the various Architectural Styles was published in the Cotta German Quarterly. The author has endeavored to characterize the styles with which we are acquainted by individual attributes, with a view to assure an easy comprehension and comparison of the same.

I. OLD INDIAN STYLE.—Childlike helplessness. Pretentious mode of expression combined with mythical freedom of imagination.

II. EGYPTIAN STYLE.—Solemn earnestness and imposing aspect.

III. GRECIAN STYLE.—Nobility of expression and of the whole effect. Stately calm.

IV. ROMAN STYLE.—Manly vigor in form and conception.

V. CHINESE STYLE.—Punchinello.

VI. EARLY CHRISTIAN BASILICA STYLE.—Expression of independence with the struggle for freedom from foreign influences.

VII. THE ROMANESQUE STYLE.—An expression of melancholy, but at the same time combined with gentility in sacred and private buildings, and grimness in castle and strongholds.

VIII. MOORISH STYLE.—Free vent to overwrought fancy, and eccentric tone in conjunction with spectacular display. The spirit of chivalry permeates the whole.

IX. THE POINTED OR GOTHIC STYLE.—The expression of inward faith till it attains exaggerated enthusiasm, ever pointing heavenwards.

X. ENGLISH LATE GOTHIC (TUDOR) STYLE—Gives the notion of practical worldly wisdom and self-reliance, and pursues its own course when allied to what is incongruous.

XI. RENAISSANCE STYLE:
Commencement: Delight at meeting again after a long separation.—Approaches.
Middle: Appreciation and influence of new relations, established after a long interruption.
End: Feeling of uneasiness; efforts to obtain Freedom.

XII. BAROQUE STYLE.—Freedom when attained misused to excess. Afterwards the following phases occur:
1ST PHASE: Stagnation.—Physical and moral exhaustion.—Sleep.
2ND PHASE: Transition to waking and rousing, owing to various influencing forces and visions of the past.
3RD PHASE: Beginning of the present lethargic and meaningless wanderings, clinging now to this, now that prominent object.
4TH PHASE: The present day.—Fully brisk and awake, but still under control.—Efforts to find the right path, at one time approaching, at another departing, from the smooth track, because the goal still appears indistinct and assumes various aspects.

UTILIZE YOUR BASEMENT APARTMENTS

In the Business Part of the City by using

HYATT'S PATENT ILLUMINATING ROOF

—AND—

BASEMENT EXTENSION.

THE LENSES MAGNIFY, HEAT, AND DO NOT BREAK.

SEE ALL NEW BUILDINGS ON THE BEST BUSINESS MART.

The present dark, damp Cellars, or Coal Vaults, of old buildings made light, cheerful, and well-ventilated Business Apartments suitable for Offices.

Read the following of the many Testimonials received:

LEVI STRAUSS & Co., Importers, 14 and 16 Battery Street,
MESSRS. P. H. JACKSON & Co., No. 2 California Street: SAN FRANCISCO, March 4, 1881.

The alteration made by you by cutting out the six door sills and risers on the front part of our store, 14 and 16 Battery Street, and substituting HYATT'S PATENT ILLUMINATING ROOF, is quite satisfactory in making in the basement apartment below, in the front part, all that we could desire as regards light. **Our entry clerks are now able to work without the use of gas.** LEVI STRAUSS & CO.

The **Basements of Messrs. Murphy, Grant & Co's Buildings,** on Bush and Sansome Streets, have been altered and are now lighted by this Improvement.

HYATT'S PATENT

FIRE AND BURGLAR-PROOF SKYLIGHTS.

The public are requested to examine the large Skylights now being erected on the rear of **A. B. McCreery, Esq.'s, Building,** corner Pine and Davis Streets; also **Senator Fair's Building,** corner Sansome and Pine Streets. By the use of these heavy Skylights, which are both fire and burglar-proof, **no extra charge in rates is made by the Insurance Companies than if no Skylights were used,** as they are not destroyed by fire, like the wood and sheet-iron skylights in common use; besides the occupant of the premises may feel his goods are safe from robbers during the time the building may be closed.

☞There are many deep stores in this city that are much in need of light, and by an addition of these Skylights all light can be obtained, besides security against thieves is maintained.

The appearance of the Skylight, as seen from the front of the store when the sun is on it, glistens with the thousands of hexagon lens. The Cosmopolitan Building, as altered, has these Skylights on the rear of the deep stores.

The Carpenters and Joiners Union.

The address from *San Francisco Union No.* 22, read before the Chapter of Architects on the 2nd instant, contains no intimation of a purpose or intent to originate or join in strikes or forced measures for the assertion and maintainance of assumed or positive rights; but deals rationally, logically, and reasonably with the grievance set forth, and asks of the architects of San Francisco that assistance and relief which should be extended by all, and which has been the rule in most of the leading offices for many years. Deeming the address well worthy the space it occupies, we publish it in full.

To THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

Gentlemen—The Carpenters and Joiners Union of San Franscisco, being Union No. 22 of the Brotherhood of Carpenters and Joiners of America, send you greeting.

In presenting our Union to your notice we respectfully submit to your consideration the reasons for forming an organization of our craft, and also our objects and aspirations for the future. We believe that such declaration on our part will meet with your approval, and we hope for your sympathy and patronage wherein we are worthy.

In the architects of San Francisco we recognize a body of gentlemen with whom our business brings us in immediate contact, and to whose ideas and designs the labor of our hands gives existence and reality. This fact should create a bond of sympathy between you and us; in the existence of such bond we have perfect confidence, and to its virtue we now apply the test.

Among the various craftsmen whose labors, under your direction, contribute to the architectural beauty of our city and the comfort and convenience of its inhabitants, the carpenter and joiner holds the most prominent and important place. The labor of his hands, more than that of any other, gives form and reality to the designs which emanate from among you. The relation between our craft and your profession, therefore, renders the inference natural that any grievance which we labor under should interest you, particularly when such grievance tends to destroy the taste and lower the skill of the workman.

We believe that the process in architecture and the development of the beauty in art depend in a great measure on the skill and ability of the various workmen engaged in the construction of our buildings. The design of the artist must mainly depend on the skill of the workman, hence his degradation involves the degradation of art.

All that we have thus far premised will, we hope, be admitted by your honorable body; we will, therefore, submit now our reasons for organizing. The business of contractor or builder in this city is followed by some who have very little knowledge of the science or practice of building, and whose only object is to make money. The condition of the building business is such (and has been so for the past ten years), that every item of material, either raw or manufactured, is regulated by a fixed scale of prices, except the labor of carpenters and joiners.

The result is that in all jobs open for competition, (which are by far the largest number), the only item which is open to reduction is our labor, and no two of them will fix the same value thereon. Having secured the job, the successful bidder naturally desires to make all the profit he can; to effect this he must bend all his energies to economize the material, because that he cannot cheapen; but the carpenter's labor, having no fixed value, offers him the largest field for exercising an economy which is as injurious to the owner as it is unjust to the working-man.

Every portion of the work that he can conveniently so dispose of is sublet, or, as it is called, pieced out. The miserable class of men who seek such piece-work are generally inexperienced or bad workmen, who could not compete as mechanics with those who have made the knowledge of the business the object of their lives. When these piece-workmen cannot obtain that kind of work, they will seek employment in that grade to which they properly belong, that is, unskilled labor.

That portion of the work which cannot be sublet to advantage or with profit to the contractor, he is compelled to have performed by the day. The main object being to cheapen labor, quantity is what he is ever after, and a wretched ambition is created among the workmen to see who will perform the largest day's work, utterly regardless as to how it is performed, for in this degrading competition quality is a secondary consideration. To perform his work well, and possess any taste in finishing it workmen *are not in demand*. This system has a damaging effect on the spirit and skill of the workmen, encourages them to disregard their work, lowers their minds, and tends to injure the entire community.

To remedy this wretched condition of things, we have formed this Union. We desire to improve the conditions of our lives and those of our fellows; and to effect that object, we do not deem it necessary to injure any one. We indorse the great principle of society, "that one man's right ends where that of another one begins"; therefore, while we desire to protect ours, we will not invade those of another, but will endeavor to protect our members against impositions of any kind. We will discountenance all attempts to exact an extraordinary amount of labor from men for the purpose to enrich any individual; such a practice is unjust both to the owner and the working-man. We hope to encourage a spirit of taste and a desire for imformation among our members; teach them to know that they are men, useful and valuable to society—equal to any and slave to none. We believe that long hours of labor are an obstacle to the mental improvement of the workman, and desire, therefore, to obtain a reduction therein through the force of reason, being satisfied that the judgment of our fellow-citizens, when concentrated on that question, will acknowledge the justice of our demands.

In brief, our objects are: to encourage and foster a spirit of fraternity among our members; to inculcate a just pride of the craft in their minds, and incite them to improvement in its practice. We intend to unite all carpenters and joiners worthy of the name for their welfare and mental improvement; teach them their duty towards one another and towards society; that, thus understanding their own rights, they may be able to acknowledge and respect the rights of others—BEING TRUE TO THEMSELVES THEY CANNOT BE FALSE TO ANY. Such are the objects we have in view, and the results we hope to achieve. The evils we complain of are acknowledged by many members of your honorable body as injurious to your clients; but as long as the members of our trade remain disorganized, these evils cannot be abated. The Carpenters and Joiners Union of San Francisco has been formed to effect a reformation in the building business, or at least in that portion which pertains to our profession. It is certainly a reformation that will produce no injustice to any, but will, on the contrary, be beneficial to all and to the community. With this purpose in view, we ask of the architects in this city their aid and patronage; the object is undoubtedly worthy of all lovers of justice, and the workman's appeal against injustice should ever be to the "chief fabricator" (the architect) of the building. Our craft has in the past produced many of the great artists whose creative genius has left monuments of architecture for the admiration and improvement of those who followed them. Had the system which prevails now here existed then, posterity would have little to admire, because the monuments would scarce outlive the builders.

The aid we ask of you is, that you positively forbid piece-work or the subletting of any portion of the carpenters' and joiners' work of all buildings under your control and superintendence; also, inasmuch as our primary object is to encourage and *compel* the performance of honest work and foster a spirit of taste and craft pride among our fellows, that you would advise the employment of our members in preference to men that are unable or unwilling to understand any honesty in work, and only "do it so that it will pass."

The above, gentleman, are the objects of our Union, stated in brief; they can be found more fully explained in the copy of our constitution which we herewith present you. On these objects we base our claim for that aid and patronage that we have asked. The wisdom of these objects and the merits of our claim are for your honorable body to decide.

Respectfully submitted by order of San Francisco Union No. 22 of the Brotherhood of Carpenters and Joiners of America.

EDWARD OWENS, President.
THOMAS C. ROWE, Rec. Sec.
N. B. CHURCHILL, Fin. Sec.
WILLIAM F. O'HALLARON, Cor. Sec.

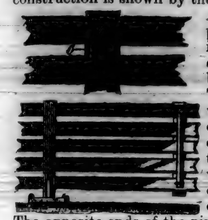
Law versus Influence.

A case of deserved retribution occurred in Chicago last week, to which we invite the attention of would-be law-breakers, if there are any such among our readers. A certain Joseph Flugel, in defiance of the statute, erected a frame house some two years ago within the building limits. The contractor, who is held jointly responsible with the owner for infractions of the ordinance, was arrested and fined, but through political influence the fine was remitted, and some informalities having been discovered in the wording of the statute, no further prosecution was undertaken, and the structure was completed. An account was then sent in for the contract price, but the ungrateful owner, quite unmindful of the troubles which the builder had undergone in his behalf, neglected to pay it, and suit was finally entered to compel him to do so. The attorney for the owner at first pleaded that the work was improperly done, but finding that the evidence would not support this assertion, he retracted it, and set up the novel defense that the house had been erected in violation of the law, and that the contractor could not recover compensation for doing an illegal act. The judge held that this plea, although not an extremely magnanimous one, was a sufficient answer to the suit, and ordered judgment for the defendant, at the same time remarking that if he had the power he would send both parties to jail. The counsel for the contractor, having no other way of consoling himself for his defeat, proposes, it is said, to take revenge on the owner by applying to the Mayor and the Superintendent of Buildings to have the house condemned and torn down. We should be glad to think that this attempt was likely to succeed, but there are many difficulties in the way, and we fear that the vindictive lawyer will be again beaten.—*American Architect.*

The London *Builder* attributes the marvelous durability of mortar in Italy to the fact that the lime remains in a pit covered with water for two years before it is used, whereas in England lime is slaked and used the same day. Most building specifications even require newly slaked lime.

New Portable Fence.

Mr. Oscar E. H. N. Reichling, of Marion, Grant County, Iowa, has patented an improved portable fence, that is easily erected or taken down, and stands firmly when erected. The construction is shown by the accompanying cut.



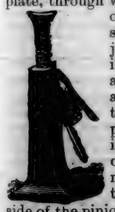
A base plate, A, is provided with a slot into which the lower end of the upright board, C, is placed. This board is provided with a series of apertures to receive the ends of transverse pins, D, which have a greater diameter in the middle than at the ends. The opposite ends of the pins are passed into an upright board corresponding with the first, but which rests on the base plate. The two uprights are then pressed together by means of wedges driven into the base plate through aperatures provided for this purpose. The upright boards are prevented from coming together by the thickness of the middle part of the pin, D, and in the opening between the boards are placed the slats which have a shoulder formed at each end that rests upon the pin, D, and prevents swaying endwise. The upper slat is provided with notches in its under edge into which the pins, D, pass, and thus serves to bind the several posts together. The slats are stiffened by means of a board, H, resting upon and crossing them on one one side, and provided with a loop at the top and bottom, through which a bar is passed resting on the other side. The base plate is held to the ground by wooden spikes driven through it, or by pins having heads that catch on the plate.

The slats of any panel can be opened at any time, conveniently and rapidly, by removing the board, H, and the rod. This is easily done, as none of the parts are nailed together.—*Scientific American.*

An Improved Lifting Jack.

An improvement in lifting jacks, as shown in the accompanying engraving, is patented by Mr. Jonathan Beihl, of Slippery Rock, Butler County, Pa.

The standard of the lifting jack is made in two parts, one part being formed with a channel extending from its upper to near its lower end, and the otherpart serving as a face plate to cover the channel in the first part. In the channel is placed a rack bar, which moves vertically, and which receives motion from a pinion journaled in plates secured to the face plate of the standard, and back of the plates is a slot in the face plate, through which the cogs of the pinion and of the rack bar engage. The shaft upon which the pinion is journaled is extended at one of its ends beyond the journal plate, and has a square enlargement, and a power lever is pivoted to this enlargement by a pin which passes through the lever and rests in a groove formed across one side of the enlargement. By this means, the lever has a lateral motion to and from the pinion. The side of the pinion next to the lever is formed with projections with which the lever engages for turning the pinion to elevate the rack bar. The opposite side of the pinion is formed with a racket, with which a pawl, that is pivoted in a notch formed in the upper part of the frame, engages for holding the pinion from backward movement, and holding the rack bar and weight at any desired point. This jack is simple, compact, cheaply made, and easy to operate.—*Scientific American.*



Market Reports.

LUMBER.—The demand for lumber is on the increase, as will be apparent from our report in "Building Intelligence." The price of Surfaced R. W. lumber, first quality, has been increased $2.50 per thousand. It is to be regretted that such is the fact, as it will have a tendency to stop many improvements that are in contemplation It is to the credit of our lumber merchants in this city that they depreceate any advance in prices, considering that the rates charged gave ample compensation for all risks involved. The advance was caused by the mill men in the producing districts. At the meeting of the Lumber Association, it was resolved that hereafter no *drummers* be employed, or no member of the Association should "go" on the bonds of a contractor.

Receipts since January 1st, 1882:

Lumber	69,859,381
Shingles	13,322,761
Laths	6,588,100

A correct price list of lumber will be found below:

PAINTS.—A new company has made its appearance, introducing the OMAHA WHITE LEAD. With the large demand that is confidently expected this year, the agents should be able to control a fair amount of patronage.

The PIONEER brand has been successfully introduced into every town and hamlet on the Pacific coast, and has given universal satisfaction. We quote price at 8 cts. per lb. and 7¾ cts. in "ton" lots.

Steel Square Problems.

A new work expaining the uses of the Steel Square. Sent post-paid to any address upon receipt of 50 cents.

Building Intelligence.

A single glance at our list will prove that building operations are more brisk than at any time for the past five years. With the improvements that will be commenced in the next 60 days—of which we are well advised—every mechanic will have employment at full wages, for some time to come.

SAN FRANCISCO.

Frame building for church for the Plymouth Congregation on Post street between Webster and Buchanan. Architects, Wright & Sanders; contractor, J. S. Burpee; cost about $30,000.

Gasometer buildings and improvements on Steiner and Francisco streets. Owners, Central Gas-light Co; architect, Harold D. Mitchell; contractors, Hughes & McCann; cost about $150,000.

Two-story and basement frame dwelling, brick foundation, on north-east corn r of Sutter and Taylor. Owner, Dr. C. Cushing; architect, H. C. Macy; contractor, J. W. Wissinger; cost, $6,800.

Two two-story and basement frame dwellings on Gough street near Hayes. Owner, B. Daniels; architect, W. H. Bayless; contractor, —— Fennell; cost, $7,000.

Two two-story and basement frame dwellings on Mission street between Sixth and Seventh. Owner, Dr. Whittaker; architect, —— Woegel; contractor, —— Plunz; cost, $9 000.

Frame building—six tenement—on Mason street between Pacific and Broadway. Owner, J. Shirley; architect, W. P. Moore; contractor, A. Jackson; cost about $8,500.

Three-story and attic frame building on the north-east corner of Sixth and Mission. Owner, Mr. Rowland; architect, J. Marquis; contractors, McCann & Jeffars; cost, $45,000.

Two two-story frame dwellings on the corner of Pine and Broderick. Owner, T. S. Merchant; architect, J. Marquis; contractor, David Perry; cost, $5,500.

Two-story frame dwelling, with basement and brick foundation, on south side Haight between Buchanan and Webster. Owner, Mr. Abbott; architect, J. Marquis; contractor, —Ingerson; cost, $8,000.

Four-story and basement, brick building, on Geary street near Taylor. Owner, J. Pierce; architects, Schmidt & Havens; contractor, T. C. Riddell; cost, $31,000.

Two-story and basement frame dwelling on north-east corner Van Ness avenue and Turk streets. Owner, B. Gallagher; architects, Schmidt & Havens; contractors, Quinn & Hennessey; cost, $7 500.

Two-story and basement frame on north side Page between Buchanan and Webster. Owner, Mrs. Healey; contractor, R. McCann; cost, $5,000.

Two-story and basement frame on north side of California between Octavia and Laguna. Owner, F. Wieland; architects, Kenitzer & Raun; contractors, Mahoney Bros.; cost, $10,000.

Two-story frame dwelling on north side of Washington between Franklin & Gough. Owner, Mr. Greenebäum; architects, Townsend & Wyneken; contractor, — Farnsworth; cost, $9,000.

Three-story frame on Howard street between Fourteenth and Fifteenth. Owner, — Behrman; architects, Schmidt & Havens; contractor, F. Klatt; cost, $6,000.

Two two-story frame, brick foundations, on Howard street between Twenty-fourth and Twenty-fifth. Owner, H. C. Somers; day's work; cost, about $6,500.

Two two-story frame, with brick basement, on south-east corner Sacramento and Van Ness avenue. Owner, N. Van Bergen; architects, Kenitzer & Raun; contractors, Conrad & Miller; cost, $16,000.

Two-story and brick basement on corner Clay & Van Ness avenue. Owner, J. B. Stetson; architect, H. C. Macy; contractor, ——; cost, about $3,500.

Four two-story, brick foundation, dwellings on north side Golden Gate avenue between Hyde & Larkin. Owner, J. Shea; architect, J. Devlin; contractor, R. Doyle; cost, $22,000.

Two-story frame, brick foundation, on north side Green near Leavenworth. Owner, Colonel Finnegass; architects, Schmidt & Havens; contractor, W. Pluns; cost, $4,800.

Three-story frame building on east side Fremont between Mission and Howard. Owners, Clot & Messe; contractor, R. McCann; cost, $8,000.

Two-story frame building on Mission between Twenty-seventh and Twenty-eighth. Owner, Lippett, Leak & Co; contractor, — Brown; cost, $3,000.

Two-story frame on Twenty-third between Mission and Valencia. Owner, L. Foge; architect, W. Winterhalter; contractor, Thom Wobrdien; cost, $2,600.

One-story frame, brick foundation, on Twentieth street between Valencia and Guerrero. Owner, S. Blackburn; contractor, George Tressler; cost, $2,000.

One-story brick building on Tenth street between Market & Mission. Owners, F. Thomas & Co; architect, J. M. Curtis; contractor, — Sanchez; cost, $1,600.

One-story and basement frame dwelling on north side California near Devisadero. Owner and builder, W. G. Hughes; cost, $2,500.

One-story and basement frame dwelling on Church street near Twenty-ninth. Owner and builder, R. Bergfeld; cost, $1,700.

Repairs to two-story frame on corner Gough and Austin. Owner, George Winterburn; contractor, D. Keller; cost, $3,000.

Two-story frame stable on corner Sacramento and Octavia. Owner, John Cooper; day's work; cost, $1,800.

Two-story frame dwelling on south-east corner Sacramento & Baker. Owner, — Mulligan; architect, T. J. Welch; contractor, J. W. Smith; cost, $3,000.

Two-story frame dwelling on north side Geary between Devisadero and Broderick. Owner, C. Welch; contractor, J. Blake; cost, $3,200.

Alterations to two-story frame on east side Pierce near Turk. Owner, J. D. Powers; contractor, W. Pluns; cost; $3,900.

A pavilion and one-story frame on Baker street between

Beach and Jefferson. Owner, P. H. Hink; architect, C. F. Mau; contractor, — Crohn; cost, $6,000.

Three barns and one two-story stable (frame) on old county road near Industrial School. Owner, George C. Smart; contractor, — Sprague; cost, $10,000.

Three-story frame, brick basement, on Howard between Seventh and Eighth. Owner, Mrs. M. J. Brady; architect, W. Mooser; contractor, Quinn & Hennessey; cost, $9,500.

Tank frame and tanks, 914 Stockton between Clay and Washington. Owners, Kim, Wing & Co.; architect, T. J. Welch; contractor, George Tressler; cost, $4,500.

Additions to dwelling corner California and Octavia. Owner, Mrs. Atherton; contractor, — Tilden; cost, $3,000.

One-story and basement frame school-house on corner Buchanan and Waller. Owner, Protestant Orphan Asylum; architects, Cleveland and Swain; contractor, A. Flood.

Repairs to two-story frame on Fell near Buchanan. Owner, Bethel; contractor, J. T. O'Brien; cost, $1,800.

Repairs to frame on north side Grove between Van Ness and Franklin. Owner, J. Maguires; contractor, J. Hamilton; cost, $1,200.

Two-story frame dwelling on Cook street near Point Lobos avenue. Owner, — Cardie; contractor, W. B. Warren; cost, $1,500.

One-story frame on west side Baker near Pine. Owner, J. S. Adams; contractor, S. M. Hills; cost, $1,300.

One-story frame on south side Post near Lyon. Owner, M. Aylward; day's work; about $800.

Repairs 2216 California. Owner, Braunschweiger; architects, Kenitzer & Raun; about $800.

Repairs to building 2412 Sutter. Owner, Diggins Bros.; day's work; cost, $800.

Repairs to building on Octavia between Fulton & McAllister. Owner, Thomas Cleary; day's work.

Two-story frame building on Third street near King. Owner, Burns & Kneese; day's work.

Repairs to building on Clara between Fourth and Fifth. Owner, J. Mahan.

One-story frame on Eighteenth and Stevenson. Owner, J. Carrol; contractor, J. Haden; cost, $1,100.

Two-story frame on Valencia street between Nineteenth and Twentieth. Owner, Hugh Curran; architect, W. P. Moore; contractor, J. Blake; cost, $3,200.

Repairs to building on Alabama between Twenty-third and Twenty-fourth. Owner, R. T. Brown; day's work; $800.

Repairs to building 232 Capp. Owner, Mr. Wente; contractor, W. F. Muller; $600.

Alterations to brick warehouse on Berry street between Fourth and Fifth. Owner, Mr. Richard on; contractor, G. T. Watterson; cost, $1,500.

Two-story frame on corner Third and Berry. Owner, Pope & Talbot; day's work; cost, about $2,800.

Additions to building corner Folsom and Main. Owner, California Oil Works; day's work; cost, about $3,500.

Frame building corner Second and Folsom. Owner, Pacific Foundry; about $900.

Repairs to building 28 Perry; day's work. Owner, P. Heyfron; cost, $750.

Repairs Fourth and Bryant. Owner, J. F. Swift; day's work; $600.

Repairs to building on north side of Union between Buchanan and Webster. Owner, J. W. Cudworth; contractors, Gray & Stover; cost, $1,400.

One-story frame building corner Chestnut and Steiner; day's work; cost, $1,400.

Additions to four two-story frame on west side Leavenworth near Broadway. Owner, H. B. Meyer; day's work; cost, $1,500.

Alterations 1619 Washington street. Owner, I. E. Smith; architect, W. P. Moore; contractors, Conrad & Miller; cost, $2,000.

Three-story frame on Montgomery avenue between Filbert and Greenwich. Owner, Martino Pianduchi; day's work; cost, about $2,500.

Alterations to building on Rausch street between Howard and Folsom. Owner, Mrs. Heffinger; contractor, — Appel; cost, $1,500.

One-story frame on Mission near Seventh. Owner, Dunn & Co.; contractor, W. H. Wolf; cost, $800.

Repairs to two-story frame corner Bryant and Decatur. Owner and builder, Thomas Jones; cost, $1,200.

One-story frame corner First and Frederick. Owner, H. Peery; $600.

Two-story frame on Brannan street near Mail Dock. Owner, American Salt Co.; contractor, C. Kinsman; cost, $3,000.

Repairs to M. E. Church on Mission street between Eighteenth and Nineteenth. Cost, about 2,800.

Two-story and basement frame on Buchanan and Webster. Owner, — Higgins; architect, Warren; contractor, R. McCann; cost, $4,500.

Two-story brick building on Townsend between Second and Third. Owner, — Kittle & Co; contractor, J. Hughes; cost, $20,000.

Alterations to Cal. Cigar Box Co. building on Berry street near Fourth; day's work; cost, $2,000.

Repairs to frame building on Fourth street near Townsend. Owner, D. Cardaire & Co; contractor, — Lehouse; cost, $1,750.

Improvements to coal depot, Beale Street Wharf. Owner, Oregon Improvement Co; day's work; cost, $3,000.

One-story frame and basement on Larkin street near Lombard. Owner, R. Webber; contractor, —— Inwood; cost, $1,250.

Filbert and Hyde, two-story frame and basement dwelling. Owner and builder, Wm. Simon; cost about $3,000.

Repairs to two two-story frames, 413 Golden Gate Avenue. Owner, J. M. Johnson; a g's work; $1,000.

Frame dwelling on Nebraska between Alabama and El Dorado streets. Owner, Mrs. Kelly; architects, McDougall & Son; $1,000.

Alterations Shotwell street between Twenty-first and Twentieth. Owner, Mrs. Hardell; architect, H. Geilfuss; contractor, —— Stecher; $500.

Alterations to building California and Stockton. Owners, French Bank; architect, A. Pissis; contractor, R. McCann; $2,000.

Two-story frame, with basement, on Shipley near Ninth. Owner, Mrs. Mary Feeny; contractor, — Beecher; cost, $2,000.

SACRAMENTO.

Two-story and basement frame on corner of Tenth and H streets. Owner, L. Williams; architects, Babson & Seadler; contractors, Carle & Croly; cost, $16,000.

One-story brick building on L Street. Owners, Huntington, Hopkins, & Co.; architect, N. D. Goodell; contractor, M. Madden; cost, ——

Additions to building 508 J street. Owner, H. Fisher; contractors, Carle & Croly; cost, $4,000.

Three-story brick building on the south side of the Square. Owner, J. F. Hill.

Rebuilding of the Metropolitan Theater on K street. Architect, W. H. Hamilton; contractors, Carle & Croly; cost, $12,975.

SAN JOSE.

Two-story brick building on south side Santa Clara street, between San Pedro and Orchard. Owner, J. Lavidan; architect, Theo. Lenzen; contractors, Kenney & Leddy; cost, $6,325.

Frame building with brick basement on south side of the Alameda, between Los Gatos Creek and the Fair Grounds. Owner, N. Cadwallader; contractor brick work, — Otto; architect, Theo. Lenzen; carpenter work by the day; cost, about $12,000.

Seven miles from San Jose, between the Monterey Road and Cayote Creek, two-story frame dwelling. Owner, H. Schelckard; architect, Theo. Lenzen; contractor, Jacob Lenzen; cost, $3,170.

ALAMEDA.

Two-story frame dwelling corner Grand street and Central avenue. Owner, H. Michaels; architects, Babson & Seadler; builders, Gilbert & Brown; cost, $7,000.

Two-story attic and basement frame dwelling on Alameda avenue, between Chesnut and Willow. Owner, Eugene Bissell; contractor, J. H. DeNise; cost, $4,000.

One-story and basement frame, corner Alameda avenue and Willow street. Owner, H. R. Jacobson; contractor, Shainer & Mosher; cost, $2,600.

One-story and basement frame cottage on Central avenue near Willow street; contractor, Millington; cost, about $2,500.

Repairs to two-story frame on Webster near Pacific avenue. Owner, D. Scully; contractor, C. Christinsen; cost, about $400.

Repairs to two-story frame on Park street near Railroad avenue. Owner, J. M. Kay & Son; contractor, S. Hatfield; cost, $500.

One-story and basement cottage corner Pearl and Santa Clara avenue. Owner, D. Penman; architect, — Chandler; contractor, S. Hatfield; cost, $2,000.

OAKLAND.

Two-story frame, brick foundation, on Vernon street (Oak View Homestead). Owner, Thos. Ewing; architect, C. F. Mau; contractor, — Smiley; cost, $4,000.

Two-story frame building corner High street and East Twelfth. Owner, Miller & Windsor; contractor, F. A. Brown; cost, $1,000.

Two-story and attic frame dwelling at Highland Park. Owner, Mr. Leaske; contractor, F. A. Brown; cost, $4,000.

Conservatory at Temescal. Owner, Captain Ainsworth; architects, Matthews & Son; day's work; cost, $10,000.

Two-story frame dwelling at Fruit Vale. Owner, J. M. Dawley; architects, Matthews & Son; day's work; cost, about $9,000.

Two-story attic and basement frame dwelling on Thirteenth and Castro. Owner, I. E. Barber; architect, Clinton Day; contractor, — Childs; cost, about $12,000.

One-story and basement frame on Willow street between Fifth and Atlantic. Owner, Thos. Hart; contractor, Thos. Dignon; cost, $750.

One-story frame on Ninth avenue near East Sixteenth street. Owner, Mr. Davis.

Four one-story and basement frame cottages on corner of Wood and Taylor. Owner, J. T. Jeffreff; contractors, Knowles & Wellbye; cost, $5,500.

One-story and basement frame cottage corner Willow and Taylor. Owner and builder, R. H. Jones; cost, $1,200.

Two-story frame cottage corner Seventh and Chester. Owner, John May; contractor, W. P. Kelley; cost, $1,600.

Two-story frame, brick foundation, at Highland Park. Owner, T. E. Polk; architects, Taylor & Copeland; day's work; cost, about $6,000.

Alterations to two-story frame near Mills' Seminary. Owner, J. A. Benson; architects, Taylor & Copeland; contractor, — Lawrence; cost, $1,000.

MT. EDEN.

Two-story frame dwelling. Owner, L. Schafer; contractor, C. F. Mau; cost, $8,000.

Two-story frame dwelling. Owner, H. Peterman; architect, Schmidt & Havens; contractor, — Haskell; cost, $5,000.

ST. HELENA.

Additions to the school-house on Oak avenue. Cost, $2,300.

SEATTLE.

The Catholics are erecting a church. Contractors, Park & Griffith; cost, complete with pews, etc., $5,200.

SAN BERNARDINO.

A theater is in process of erection by Messrs. J. Waters & H. Brinkmeyer; cost, about $15,000.

LIVERMORE.

Two-story brick building. Owner, — Hawley; day's work; cost, $10,000.

One-story and basement frame. Owner, Wm. Callahan; cost, $1,500.

One-story frame dwelling. Owner, — Harris; contractor, — Hatch; cost, $1,000.

PORTLAND.

Contracts were let for two new public school-houses. Davidson & Sharno, contractors; cost, $27,398 and $27,698 respectively.

STOCKTON.

Five-story brick building for flour-mill. Owner, Sperry & Co.; architects, Percy & Hamilton; contractors, Ed. P. Allis & Co.; manager, J. R. Cross; cost about $125,000.

SAN RAFAEL.

Two-story and attic frame dwelling. Owner, Thos. Menzies; architects, Wright & Sanders; cost about $20,000.

TULARE.

Building for stores and lodge room. Owner, Olcese & Garibaldi; architect, H. D. Mitchell; cost, $7,000.

OAKLAND.

Frame cottage on Clay street between Fourteenth and Fifteenth. Owner, —— Hyde; contractor, —— Englishman, cost, $2,500.

Old Ladies' Home. Architects, McDougall & Son; contractor, —— Herbst; cost, $23,000.

BERKELEY.

One-story frame cottage on San Pablo Avenue. Owner, J. Jensen; architect, H. Geilfuss; contractor, —— Herbst; $1,400.

WOODLAND.

Frame building on Third street. Owner, S. Barnes; contractor, Mr. Blake; $1,175.

One-story building on Railway street. Owner, C. E. Dingle; contractor, W. H. Carson; $1,500.

Two-story barn on Railway street. Owner, W. Shellhammer; day's work.

Small dwelling near town. Owner, Mrs. Roberts; $700.

Repairs and additions to the Hesperion Cottage. Contractor, W. H. Carson; $2,300.

Alterations to building on Front street. Owner, S. Hyman; day's work.

Alterations to two houses owned by —— Sprague. Contractor, Amesberry & Co; $800.

FRESNO.

One-story brick building for distillery and wine cellar. Owners, George H. and H. C. Eggers; architect, H. Geilfus; day's work; cost, about $12,000.

Two-story brick building on Mariposa street. Owner, W. Robertson. Contractor, W. Betteridge; cost, $1,800.

One-story and basement brick building. Owner, S. A. Miller; contractor, W. Betteridge; cost, $8,500.

One-story frame building. Owners, Dr. S. Leach and O. Froclich; contractor, — Oldfield; $1,500.

RIGGS.

Two large bridges are being built over the Cherokee Canal; day's work; J. W. Myers, Supt.

Frame barn. Owner, W. F. Boulwan; contractor, J. W. Myers.

One-story frame building. Owners, T. & J. Webb.

Frame building for wagon shop. Owner, John Sha.

REDDING.

One-story brick building, 75x140, corner California and Butte streets. Owner, Hon. C. C. Bush; contractor, A. J. Bryan.

CENTREVILLE.

Two-story frame and basement frame dwelling. Owner, S. H. Hall; architects, S. & J. C. Newsom; contractors, Knight & Littlefield; cost, $4,100.

Book Notices.

Interiors and Interior Details.—A new work containing 52 large quarto plates, comprising a large number of original designs of halls, stair cases, parlors, library rooms, dining rooms, wood mantels, sideboards, furniture, wood ceilings, etc., making a valuable series of *suggestion for architects and architectural designers.* Also a large collection of interior details, suited to the requirements of carpenters, builders, and mechanics. By William B. Tuthill, A. M. We will send the above work to any address upon receipt of the price, $7.50.

Modern House-Painting.—The want of a work of this character has long been felt. A very meritorious effort has been made to supply this want by Messrs. E. K. Rossiter and F. A. Wright, architects of New York. They have prepared a work containing numerous *colored lithographic plates*, exhibiting the use of color in exterior and interior house-painting, and embracing examples of simple and elaborate work, in plain, graded, and party-colors. The great merit of this work is in the colored plates, by which any one can see at a glance how a house would appear if painted according to the authors' directions. Sent to any address upon receipt of $5.00.

Village and Country Homes.—Nearly one hundred designs 9x12 inches. Price $5.00.

Standard Sign-Writer and Letterers' Companion.—A new invoice just received. Price $2.00.

Kansas City Review of Science.—No. 1 of Vol. VI has come to hand of this, one of the most valued of our numerous exchanges. The editor has excelled himself in the first number of the new volume, and has given his readers a series of articles, each one of which is worth more than the price of the book per year. $2.50 is the low rate for which the *Review* is sent to any address.

All books noticed in these columns can be had at publishers prices at this office. Sent post-paid to any address.

Practical Lessons in Architectural Drawings	$ 2.50

Owners Want too Much for Their Money.

This is an oft-repeated saying among contractors, and great stress is laid upon the injustice of the course claimed to be pursued by many owners. But for argument's sake, admit that parties contemplating the erection of buildings do propose and offer to pay but seventy-five, eighty, or ninety cents for every dollar's worth of material and labor received. Are contractors bound to accept the proposition? It always requires two or more to complete a bargain, and no proposition made by one party is binding upon another until the second *voluntarily* accepts that which is proposed by the first. Consequently, those who accept such unfair proposals, and deliberately enter into oppressive obligations, simply because somebody wants them to do so, certainly do not demonstrate the possession of any large amount of sound business sense. No one in this free land of ours is *obliged* to submit to unjust exactions in business transactions, particularly when business is active, and those who propose to do intend and will carry out their purposes, whether the cost be more or less than their limits. One thing is certain, thousands of building contracts have been let in San Francisco for *less sums* than owners were willing to pay; and a large amount of money, greater than has been, might have been handled by contractors, had a wise and correct system of figuring prevailed among them. But admit again for argument's sake, that owners do seek to secure the improvement of their property for less than actual cost, does it become the duty, and is it a virtue on the part of contractors, to bow the business knee and bare the manly brow to such propositions? Certainly not. And yet it matters not how mean a proposition may be, there are hosts of hungry men—hungry for the pleasure of signing one or many contracts, and controlling a few thousand dollars, with more of doubt and uncertainty than assured profits at the end of the operations. The fact is, that building contractors, as a rule, have been more earnest and determined in purposes to obtain work, and *beat* the next man, than in devising and maturing correct and safe methods of figuring. The average number of contractors who estimate by the safe rule of *certainties*, minus all speculative suppositions, is small compared with the many who figure to win, risking the chances upon the various devices so generally resorted to by *low figurers* to save, omit, and economise, and ride over plans and specifications to the full extent of possibilities.

If owners do ask for more than is right, the generality of contractors have assisted in creating that disposition by reckless *under*-bidding; and the manifestation of a willingness to serve any man who asks their service, with scarce ever a firm, manly, and determinative *refusal* to yield when propositions are advanced, seeking abatement of the sum proposed as a right and proper cost, and other methods of obtaining much for little pay.

The facts are, that the contracting business has been and is overcrowded; the mediocre, wholly incompetent, and shamefully deficient outnumbering the more competent, reliable, and safe men. Hence innumerable wrongs in various shapes and forms have developed and attached to the building contracting business, and the drift of things generally has been to pile up stumbling blocks in the way of good men and *general success*; rendering it difficult for any not enjoying *special advantages*, to pursue the business with profit. And as one of the natural results of this irregular condition of things, impressions prevail among a considerable number of property owners, that by a little effort on their part in manipulating arrangements, understandings, and preliminary movements, they can save from five to twenty per cent. in outlays for building purposes, which they often do, because of the yielding by contractors to almost any proposition which presents the slightest prospects for work, thereby virtually sanctioning operations adverse to the best interest of the mechanical classes.

Architects vs. Economy.

The full report in our Building Intelligence has been the subject of much remark among those most interested, partly on account of the great percentage of buildings that have been erected without the services of the architect being called into requisition. We have reported buildings the cost of which have been over $10,000, and the owners thereof have had the buildings erected, the carpenter drawing the plans and carrying them out, no architect being in supervision of the job.

Owners sometimes deceive themselves, and imagine that they can get along as well without, and save the expense of an architect in the erection of the buildings. Some may have done so to their satisfaction, but the more general experience is, that it is a very unwise course for an owner to pursue. By it, many a building has been spoiled in its arrangement and construction, and the loss in diminished rents, vacant premises, and the continually occurring repairs, amount to as much each six months, on an average, as would have paid a competent architect full fee for his services.

Owners are often brought to grief by their mistakes in the means employed by them to avoid an architect's fees, and obtain the plans and details necessary for their buildings. In order to obtain the latter, and get rid of the "fee," some "friend carpenter" is intrusted with the whole matter of plans, specifications, and construction. In such cases, *repentance comes too late to the victimized owner.* The party to whom the work is intrusted makes the plans, and the work is commenced with a "*smile*" all around. The frame is inclosed, and the partitions set. A practical plumber is called in, who puts in the gas and water pipes under the carpenter's superintendence, and for a while things go on swimmingly. The walls are plastered, and then the first trouble begins. The good wife who is to inhabit the mansion now gets her first practical idea of how the house will look on the inside when finished. Rooms are found to be out of proportion; closets wanting; gas and water pipes in wrong place; not head room enough for the stairs, etc. Changes are begun, and until the building is finished, the general order of the day is to "*fix*" up things to correspond with the owner's "*improved*" ideas.

The house is finished, and it would amuse a "professional" if some of the balance sheets of a first year's residence in some of the "no-architect's houses" could be shown to outsiders. We had the pleasure of seeing one of these documents, and here are a few of the items.

Taking up and replacing floors to fix water pipes	$11
Changing sink, and adding a trap, none having been provided	9
Raising of one corner of the house, it having settled so much that it had to either go up or owner go out	32
Repairing leaks in roof	7
Whitening walls stained by leaking of roof	5

But we will not continue our enumeration of the evils which are incident to every house whose plans has not been thoroughly studied and specified before the commencement thereof.

Such cases as the above are well known to more than one of the architects of this city, and many a "served him right" is indulged in, upon the principle that a competent physician laughs at the sufferings of a patient whose pains and agonies result from self-treatment or quack practice, or the educated lawyer smiles when his client gets himself into a *terrible fix* by intrusting his case to some pettifogger, or who tries to work out the intricacies and problems of law by his own self-conceited legal ingenuity.

San Francisco Chapter American Institute of Architects.

The regular meeting of this chapter was held on the 7th ult. A large attendance was present, and the good feeling and interest taken in all the subjects brought before the chapter excelled those of any meeting since its organization.

The committee appointed to consider the address presented by the Brotherhood of Carpenters and Joiners were granted further time, as the subject is of such importance that a report, unless thoroughly discussed, might not express the views of all the members of the chapter.

The Constitution and By-Laws as amended were adopted as a whole, and two hundred and fifty copies were ordered printed.

George H. Wolfe was unanimously elected Corresponding Secretary.

Proposition for membership was received, and several members came forward and paid their dues. On motion, all dues that have been paid or shall be by the 1st of September, 1882, shall be considered as paid in full to that date, provided the initiation fee shall also have been paid.

A communication was received from the Metal Roofers and Sheet Iron Cornice Maker's Union. It being very late, action thereon was postponed until next meeting.

Draughtsmen and Builders.

We would call particular attention to the ad., on page 106, of DRAWING INSTRUMENTS, AND HOW TO USE THEM. Also to the publication, "Carpentery Made Easy," page 12.

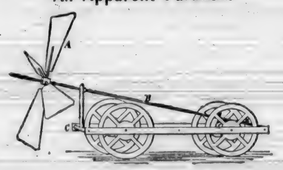
"American Cottage Homes" is a new work just issued, and well deserves the favorable mention it has received in the Eastern journals. It contains plans, elevations, perspective views, sections, details, also specifications, form of contract, and descriptive letter-press on back of each plate. It is illustrated by 40 9x12 plates, with over 260 drawings. It will be sent to any address upon receipt of publishers' price.

Necessity and Invention.

Given the best material, ample facilities, and a high order of inventive skill to devise something new, such material, facilities, and skill had much better be turned to other account if there be not a demand for the article in question. Invention is the offspring of necessity in the fullest sense, and unless the something produced fills a niche in the wall of wants, the inventor had better have devoted his brains, time, and material to other employment. It is the disregard of this phase of the great natural law of "demand and supply" that cumbers the patent-office with specifications of so many inventions that come to naught. The number of improved bootjacks, rat-traps, and miscellaneous articles which have been patented is legion. Men mistake invention for a business, and enter into it as they would in selling dry goods or making shoes; possessing a knack for invention they bring forth an array of articles intended for almost every use in the calendar. Some of these are very cunningly contrived, no doubt, but the reason why they fail to bring remuneration to the inventor for the time, labor, and money expended in perfecting them is that the world's economy does not require them. There has been a waste of forces. The vital trouble lies in the fact that these inventors look at the matter from the wrong end. They set about to make "something," trusting that its radically new character will find a place for it, instead of trying in the first place to discover what thing the exigencies of this or that trade demand. Sometimes one of this class will succeed in hitting upon a valuable invention. We will say that his work is some piece of mechanism connected with cotton manufacture. He immediately begins to adapt the principles of his invention, or a modification of them, to iron-working or some other branch of industry, and oftentimes loses what he gained in his mania for inventive experiment. The "professional" inventor rarely succeeds in the long run.

And yet the field for invention is by no means closed. There is every encouragement to-day for inventive genius. Great and revolutionary as have been our improvements in machinery, industry awaits and will pay for others. There is need of more perfect appliances for treating cotton between the field and the factory; a machine is wanted to manipulate jute and like fibers, to the end that we may make such staple products and compete with the poorly paid labor of countries across the water. A fortune awaits the successful inventor in these and many other fields, but in every one the necessity must first exist. In many instances the pressure of circumstances almost compels the invention of the thing desired. We see this nowhere better illustrated than in the annals of prison life. Some of the most curiously contrived tools known to mechanical experts have been fabricated by prisoners in their endeavors to escape. Here an imprisoned convict, lacking tools or material, contrives to make a key by scraping lead from a water pipe, melting it in a spoon over a fire made from splinters of his furniture, and casting it into form, and with it opens intricate locks. Others perform almost superhuman feats in the way of producing inventions for cutting iron bars, drilling through iron doors, breaking through heavy stone walls, and constructing ladders, weapons, files, saws, hammers, and other tools. The same conditions exist where legitimate invention is concerned. It does not depend so much on the facilities that the inventor has at his command as on the necessity for the thing which he seeks to produce.—*Carpentry and Building.*

An Apparent Paradox.



Some months ago a question was proposed to me by an engineer of the United States Navy, and it was this: "Can a windmill be made to propel a vehicle directly against the wind, the wind blowing parallel to the axis of the windmill, and at right angles to the axles of the vehicle?" I replied that I believed it could.

After a warm discussion, in which several other engineers present took part, the discussion closed without any decision of the question. I might say that but one of the disputants agreed with me in my views of the question. As I believe in a practical demonstration of all theories, a few weeks afterward I made a model, like the one shown in the accompanying engraving. It consisted of four brass clock wheels 2″ in diameter, and two strips of brass, *C D*, held together by three round bars, also used in making clocks. The spindle of the windmill, *B*, was made of a large-sized steel knitting-needle. The windmill, *A*, was 4″ in diameter, the blades being made of sheet copper soldered to wire spokes at an angle of 45° with the axis *B*. A pinion, *E*, $\frac{3}{8}$″ in diameter outside, and having 8 teeth, was fastened to one of the axles, and a worm $\frac{1}{4}$″ in diameter, with a pitch of ten threads to the inch, was placed upon the spindle *B*.

This little piece of mechanism was placed before a Root blower and nicely adjusted. When the blower was set in motion by hand, the model began to move towards the open end of the air pipe, and the harder the blast, the faster the model ran, contrary to the predictions of those who beheld it. Some even said it would move backwards.

This may be interesting to the readers of the *American Machinist*, and perhaps some of them will be kind enough to explain *how* and *why* it moves, as it is settled beyond a doubt that it does move, and with considerable rapidity, against the wind.—*American Machinist.*

Jumping at Conclusions.

The world is full of error and injustice, by reason of the prevailing disposition among mankind to prejudge the acts and sayings of their fellowmen, and to concoct and assert intentions and purposes *for others* never dreamed of by the parties upon whom the responsibilities are sought to be cast. This disposition to prejudicate is almost universal, and is, as a rule, false and unfair to a greater or lesser extent: not unfrequently absolutely so, and in millions of cases practiced from evil motives, and for purposes of the basest character. The man who by word or act places himself in a position where criticism or attack is possible is certain to be "picked to pieces," it matters not how pure and worthy the actuating motives in him may have been or is, or how free from wrong intent; if the *possibility* of impeachment, by forced constructions, misapplied reasonings, or theorizings *made to fit*, to the exclusion of real truth and fact, the sacrifice is demanded with a cool indifference as to personal rights of explanation or interpretation.

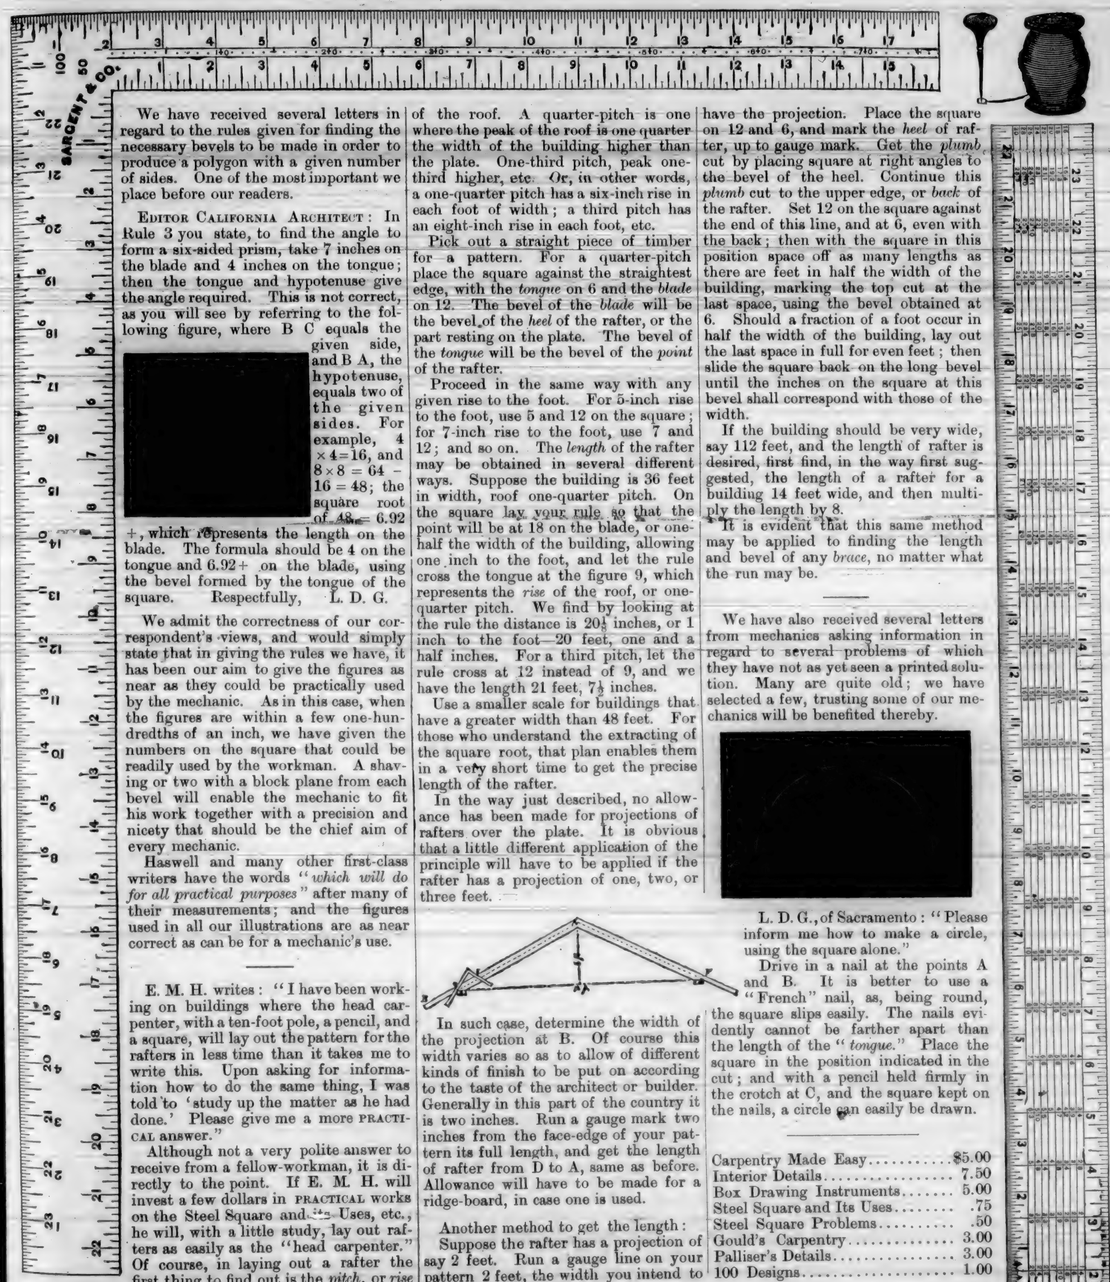
There are but few men—none of any material consequence or influence in the affairs of life—who have escaped this terrible tendency of the age to misrepresentations. And this evil has thrived and grown and become popular, because the masses derive pleasure from the unreal, fanciful, and visionary. The plain, matter-of-fact rule seems tame and unsatisfying in comparison with the exaggerated, overwrought, and high-strung statements and stories provided by that liberal-minded class of beings who so freely *give* away without charge their own interpretations of other people's acts and sayings, caring nothing for the correct truths and motives involved. These tongue and pen pictures, overwrought and highly colored though they be, seem to meet the liking of the present generation; and because they are received with general favor, the cursed evil is found to flourish in all grades and ranks of society, from the imperial throne down to the scavanger's hut. In this respect the old Bible Saw is most emphatically true, that "all men are liars." People do not like to bear—and will not gently—the opprobrious charge of lying; yet absolutely, the man or woman does not live, and never has, who at times and under circumstances has not misjudged the motives and mistaken the acts of others, in some form or shape. Thus it has been with the best and purest, and a thousand *times* more so with the great mass of humanity, with whom pure truthfulness and just judgment, at the sacrifice of that which will gratify personal feelings, and give scope and force to interested or malicious representations and motives, are as but the foam upon the ocean's surface, or the feather before the resistless storm.

Draughtsman's Paper.

A lecture was recently delivered before a Berlin drawing society on paper for the use of draughtsmen. Drawing-paper, now-a-days, certainly admits of division. The common sort, for rough drawings, is made from hemp, with a small portion of wood pulp added. This paper, although fairly adapted for the pencil, does not take corrections readily. It is altogether unfitted for water-color sketches. The paper prepared by the lecturer, Herr Wendler, and known as Wendler paper, is manufactured in two shades, a white and a yellowish. The latter is preferred by architects. The double animal-sized drawing-paper is somewhat equivalent to Whatman's paper, and takes India-ink very well. Whatman's paper is triple-sized, and drawn on linen. As tracing-paper, silk-paper may be considered the cheapest, and some of the best draughtsmen, etc., use no other. The French tracing-paper is cheap, but soon turns yellow. The German is far less brittle. The Whatman papers are very good, but very dear. That known as Ingres paper, after the great painter, is specially adapted for chalk drawings. It is prepared in some twenty shades. The Belgian-toned paper has a more regular grain than the French. The Canson Mongolfier paper is a rival to the Ingres, and has a large sale. The different kinds manufactured by Whatman would fill a page to mention. Bristol and Piries papers are also well known.—*Mechanical News.*

S. F. Chapter A. I. A.

At the next regular monthly meeting, the first Friday in August, nominations will be made for officers of the ensuing term, according to the provisions of the Constitution and By-Laws lately adopted.



We have received several letters in regard to the rules given for finding the necessary bevels to be made in order to produce a polygon with a given number of sides. One of the most important we place before our readers.

EDITOR CALIFORNIA ARCHITECT: In Rule 3 you state, to find the angle to form a six-sided prism, take 7 inches on the blade and 4 inches on the tongue; then the tongue and hypotenuse give the angle required. This is not correct, as you will see by referring to the following figure, where B C equals the given side, and B A, the hypotenuse, equals two of the given sides. For example, $4 \times 4 = 16$, and $8 \times 8 = 64 - 16 = 48$; the square root of 48 = 6.92 +, which represents the length on the blade. The formula should be 4 on the tongue and 6.92+ on the blade, using the bevel formed by the tongue of the square. Respectfully, L. D. G.

We admit the correctness of our correspondent's views, and would simply state that in giving the rules we have, it has been our aim to give the figures as near as they could be practically used by the mechanic. As in this case, when the figures are within a few one-hundredths of an inch, we have given the numbers on the square that could be readily used by the workman. A shaving or two with a block plane from each bevel will enable the mechanic to fit his work together with a precision and nicety that should be the chief aim of every mechanic.

Haswell and many other first-class writers have the words "*which will do for all practical purposes*" after many of their measurements; and the figures used in all our illustrations are as near correct as can be for a mechanic's use.

E. M. H. writes: "I have been working on buildings where the head carpenter, with a ten-foot pole, a pencil, and a square, will lay out the pattern for the rafters in less time than it takes me to write this. Upon asking for information how to do the same thing, I was told to 'study up the matter as he had done.' Please give me a more PRACTICAL answer."

Although not a very polite answer to receive from a fellow-workman, it is directly to the point. If E. M. H. will invest a few dollars in PRACTICAL works on the Steel Square and its Uses, etc., he will, with a little study, lay out rafters as easily as the "head carpenter." Of course, in laying out a rafter the first thing to find out is the *pitch*, or *rise* of the roof. A quarter-pitch is one where the peak of the roof is one quarter the width of the building higher than the plate. One-third pitch, peak one-third higher, etc. Or, in other words, a one-quarter pitch has a six-inch rise in each foot of width; a third pitch has an eight-inch rise in each foot, etc.

Pick out a straight piece of timber for a pattern. For a quarter-pitch place the square against the straightest edge, with the *tongue* on 6 and the *blade* on 12. The bevel of the *blade* will be the bevel of the *heel* of the rafter, or the part resting on the plate. The bevel of the *tongue* will be the bevel of the *point* of the rafter.

Proceed in the same way with any given rise to the foot. For 5-inch rise to the foot, use 5 and 12 on the square; for 7-inch rise to the foot, use 7 and 12; and so on. The *length* of the rafter may be obtained in several different ways. Suppose the building is 36 feet in width, roof one-quarter pitch. On the square lay your rule so that the point will be at 18 on the blade, or one-half the width of the building, allowing one inch to the foot, and let the rule cross the tongue at the figure 9, which represents the *rise* of the roof, or one-quarter pitch. We find by looking at the rule the distance is 20¼ inches, or 1 inch to the foot—20 feet, one and a half inches. For a third pitch, let the rule cross at 12 instead of 9, and we have the length 21 feet, 7½ inches.

Use a smaller scale for buildings that have a greater width than 48 feet. For those who understand the extracting of the square root, that plan enables them in a very short time to get the precise length of the rafter.

In the way just described, no allowance has been made for projections of rafters over the plate. It is obvious that a little different application of the principle will have to be applied if the rafter has a projection of one, two, or three feet.

In such case, determine the width of the projection at B. Of course this width varies so as to allow of different kinds of finish to be put on according to the taste of the architect or builder. Generally in this part of the country it is two inches. Run a gauge mark two inches from the face-edge of your pattern its full length, and get the length of rafter from D to A, same as before. Allowance will have to be made for a ridge-board, in case one is used.

Another method to get the length: Suppose the rafter has a projection of say 2 feet. Run a gauge line on your pattern 2 feet, the width you intend to have the projection. Place the square on 12 and 6, and mark the *heel* of rafter, up to gauge mark. Get the *plumb* cut by placing square at right angles to the bevel of the heel. Continue this *plumb* cut to the upper edge, or *back* of the rafter. Set 12 on the square against the end of this line, and at 6, even with the back; then with the square in this position space off as many lengths as there are feet in half the width of the building, marking the top cut at the last space, using the bevel obtained at 6. Should a fraction of a foot occur in half the width of the building, lay out the last space in full for even feet; then slide the square back on the long bevel until the inches on the square at this bevel shall correspond with those of the width.

If the building should be very wide, say 112 feet, and the length of rafter is desired, first find, in the way first suggested, the length of a rafter for a building 14 feet wide, and then multiply the length by 8.

It is evident that this same method may be applied to finding the length and bevel of any *brace*, no matter what the run may be.

We have also received several letters from mechanics asking information in regard to several problems of which they have not as yet seen a printed solution. Many are quite old; we have selected a few, trusting some of our mechanics will be benefited thereby.

L. D. G., of Sacramento: "Please inform me how to make a circle, using the square alone."

Drive in a nail at the points A and B. It is better to use a "French" nail, as, being round, the square slips easily. The nails evidently cannot be farther apart than the length of the "*tongue*." Place the square in the position indicated in the cut; and with a pencil held firmly in the crotch at C, and the square kept on the nails, a circle can easily be drawn.

Dwelling-House Sanitation.

BY GLENN BROWN.

[The following, from the pen of Glenn Brown, Esq., a brother architect of Washington, D. C., is a portion of a lengthy, ably written article upon the subjects discussed, and should be read by *all classes* of people; for all, rich and poor, are alike liable to the evils and dangers so fully presented by the writer.]

"Pure air, pure water, and a pure soil."—HIPPOCRATES.

The question of proper sanitary arrangements in our homes is a matter of such vital importance that an attempt to instruct the public in the most approved arrangements for sanitation needs no apology.

The subject is specially significant to the head of the family, as a citizen having the good of the community at heart, and as a parent having the welfare of those immediately under his charge involved in his care and guardianship; and although it is with the sanitary arrangements of the home as such that we have to deal in this article, the home is but part of society at large, and our remarks apply to questions which affect all, and in which all are interested.

It is impossible for any one to breathe vitiated air or gas, or drink impure water, or eat tainted food, and yet live and grow in health. Such conditions are seriously detrimental to the constitution—very often fatal. Many deaths do occur, as well as much trouble, expense, and pain, which might all be avoided, provided the heads of households would take the trouble to inform themselves on these weighty matters of every-day life. There is nothing which can compensate us for the loss of health, certainly neither wealth, nor the comforts and luxuries which accompany wealth. We all acknowledge this, and yet how strange to see the indifference and carelessness which the majority of mankind are constantly manifesting about this very point; when the proper precautions to be observed for the preservation of health are within the reach and adoption of all who will but think and act.

We shall, in this article, describe the different sanitary arrangements necessary in a home, according to the present status of sanitary science, to guide those desiring information, so they can judge whether the best practice is being carried out in their own case.

The sanitary arrangements of a house consist of its situation, exposure to light and air, heating, ventilation, and drainage, in their proper selection, planning, and workmanship.

The situation of the house is first to be determined. By carelessness in this particular, one may get into a malarious district, where fever and ague would be unavoidable, or one may have his house located on a soil where the water never drains off, and where the gases caused by decayed matter are constantly rising into the house and causing disease. The proper position of the house in regard to sunlight and the prevailing winds is a matter of importance; for in the sunlight we find health and comfort, while cold and wet winds are always hurtful in their effects, and to be avoided. In the heating apparatus (by which hot air is supplied), care must be taken that the air which is to be warmed shall be pure. It must be neither too hot nor too dry for breathing, as the lungs are thereby affected. The air is liable to be contaminated by coming from a foul source, over a sewer drain, or from a badly ventilated cellar, and after its entrance into the house by absorbing gases from the overheated surface, cracks, or joints of the heating apparatus.

The art of ventilating properly requires that the impure air which comes from our lungs, the foul exhalations which come from our bodies, and are absorbed by the air, as also the vitiated air which is caused by combustion, or comes from other sources, may all be carried off, and an abundant amount of fresh, pure air may be supplied in its place.

The proper arrangement of the plumbing has the most important part to play as respects the health of a family. In what manner sewer gas affects the health is a much-disputed question; that it does, and causes typhoid fever, dysentery, diphtheria, and other similar diseases, is an established fact. Dr. De Verona, in his work on sewer gas, says: "If the physiological effects which follow the breathing of sewer gases are actually produced by what then enters the organism, it must be something besides oxygen, hydrogen, nitrogen, carbon, and sulphur, in their various combinations. There exists in living sewage multitudes of living germs. These germs are capable of growth and self multiplication. . . . . They are infinitely small, light, capable of being lifted by the slightest current of air; in fact, their habitat is watery vapor. In pure, dry air they immediately perish; in impure air, charged with moisture, they live for a time yet undetermined; in humid air, charged with putrified animal matter, they live, nourish themselves, and acquire the full vigor of their nature. If, now, they are deposited in a proper indus, they reproduce themselves by myriads." We must leave it to the physician or the scientist to find whether or not the specific germ disease theory of Pettenkofer, or the putrefactive ferment theory of Sanderson or Beale, deserves the more credit. It is the duty of all who have the sanitary arrangement of their homes to superintend to endeavor to keep foul air and gases out of their houses and away from their water and food. Whether it comes from the refrigerator through the waste, and is absorbed by our milk, meat, or other food, and thus taken into the system; whether it enters our wells, pumps, or cisterns, through natural conduits from cesspools or sewers, or our tanks through their waste; or whether it comes through the water-closet, wash basin, or from a foul cellar, and is drawn into the system with the breath—it is equally deleterious to those who dwell in the house, and affects, as matter of course, the men who have their business down town and in the open air less than those who stay constantly in the house and breathe these deleterious gases and germs all day. This sewer gas is truly very subtle, and will find its way through the smallest crevice; floors, brick and stone walls, offer but a slight impediment to its passage, and it contaminates the water, air, or food with which it comes in contact. To show how dangerous this contamination may be, we will quote an extract from the report made by the Massachusetts Board of Health in 1871 on the causes of typhoid fever. It concludes that its propagation is caused by a poison as definite as that which causes vaccine, and divides the means of propagations under three heads: "First, drinking water made foul by the decomposition of any organic matter, either animal or vegetable, and specially by the presence of excrementitious matter discharged from the bodies of those suffering from typhoid fever; second, propagation by air contaminated by any form of filth, and specially by privies, cesspools, pig styes, manure heaps, rotten vegetables in cellars, and leaky and obstructed drains; third, by emanations from the earth, occurring specially during the autumnal months and in seasons of drought." Dr. Bowditch of Boston, by private investigation in this country and Europe, concludes that consumption is increased by residence on damp soil, and it has been proved that thorough drainage of localities decreases the annual rate of consumption.

The financial aspect of the loss of health cannot be computed by the actual time lost during sickness. The time consumed by other members of the family while waiting on the sick one, doctors' bills, medicines, and luxuries, tend to make sickness very costly; impoverishing those who are in moderate circumstances.

It is impossible to compute how much a man loses by half doing his work when he is not well. The *Plumber and Sanitary Engineer* truly says: "Modern research has classed these diseases as preventable, and we may be pretty sure that they are governed by physical laws as immutable as the law of gravity, and depending only for their propagation and development upon circumstances and combinations which are within human control, and for which we are therefore to be held responsible."

Having shown the evils which may be produced by bad sanitation in our homes, and how these effects are liable to be produced, we will now give a description of the different sanitary arrangements in general use, pointing out the faults in each, and also naming the ones which are approved by the best authorities, with the reasons for their approval.

The proper general arrangements for the sanitary protection of our homes will be first discussed, then we will proceed to the special arrangements for the same purpose.

It is an advantage for a house in our latitude to have a southern exposure; with it, we get the cool breeze in the summer and the cheering effects of the sun in winter. There are many good authorities who consider sunlight necessary to our health, the Germans making it a requisite in their school plans. With a northern exposure one gets but a cold and cheerless outlook; the front yard or pavement will remain damp and unhealthy, especially if not well drained. Eastern exposure has no advantage over a western; but either eastern or western exposure is preferable to a northern. A lot, in a city, having a southern with an eastern or a western exposure is very desirable, for then we obtain sunlight on three sides of our house; keeps the front and back yards dry and healthy, and adds to our comfort and pleasure. In the country, our house can have windows on all sides, and it is very desirable that buildings in cities should be detached from other buildings whenever it is possible. When thus by itself, a house will be surrounded by light and air that is comparatively pure, and it is much easier so to avoid those abominations, dark rooms, as well as to thoroughly ventilate the house.

In the situation of a house a site must be selected, when possible, where the natural soil is good for the health, and will not harbor disease. The best soil for this purpose is deep gravel or sand, which will readily drain off the water and allow free access to the air. A fertile soil, an impervious subsoil (clay), or rock near the surface retains the water, and thus hastens decay, and makes a suitable atmosphere in which disease germs may live. If it be not possible to select one's building site in regard to the natural drainage, the lot must be drained artificially. Drainage of site and foundation should be done by land tiles having an efficient outlet, but in no case connecting directly with cesspools or sewerage system. The smallest size tiles will answer for the largest house. The bottom of all cellars should be concreted with an asphalt coating on top of the concrete. This will tend to keep the deleterious gases from rising into the house from the ground.

Radiant heat, that is, heat which passes through the air without heating it, and which only heats the bodies with which it comes in contact, is considered less hurtful than heated air. Sunlight and open fires produce radiant heat; stoves, steam and hot water coils, first heat the air, and by that our bodies are heated, and give off a small amount of radiant heat; furnaces give us only heated air.

Heating and ventilation are so intimately connected in our dwelling-houses, that it will be convenient to treat of them together. Stoves and furnaces are the modes of heating most generally used, and the proper material of which they

should be made, and how they should be arranged, are matters of importance to the health of households. In this country stoves are manufactured almost exclusively of cast and sheet iron. On the continent of Europe there are a great many porcelain stoves in use. They are large and unwieldly, and are nearly air tight, thus heating the air in the room, and taking off none of the effete air, except what is withdrawn through crack and joints. Parties who visited the Centennial will remember seeing these porcelain stoves on exhibition. The objection to the use of stoves lies in the fact that they heat the air of the room by actual contact with it, and afford no means of taking away the vitiated air. Of all stoves, the open stove is the most conducive to health, giving off radiant heat, and also allowing egress for vitiated air, thus to a certain extent taking the place of an open fireplace. In selecting stoves for heating our homes, the open or grate stoves should be chosen, and there should be an inlet for the fresh air, either made particularly for ventilation back of the stove, so that the air can be warmed to fifty degrees, so it will not chill any one as it comes in; or the air may be admitted at the meeting rail of the window sash, by letting down the upper and hoisting the lower sash about half an inch. This will not bring the sash above the stop bead, and it will allow the air to enter between the two sashes, the air being deflected upward and thoroughly mixed with the air of the room without causing disagreeable drafts.

In heating stoves care must be taken not to heat them to redness, as Dr. Derby states the gases of combustion will pass through red-hot cast iron.

(To be continued.)

The Paradox Wheel.

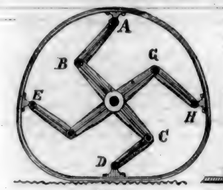

Fig. 1.

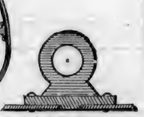

Fig. 2.

So called from its appearance; for, seeing that all the internal parts, *a b c d* and *e f g h*, are pivots which support the whole of the internal parts, and that the cross in the center is also free on the axle after the manner of a pair of scissors, a collapse appears inevitable; whereas the axle continues as firmly in the center as in the ordinary wheel with fixed spokes, and the elastic tire gives way, and flattens on the ground with the same freedom as if the load were merely placed on the top of the elastic tire; and (as I shall show) gives us a base equal to the sleepers which (on a railway) support proportionately a locomotive engine (see Fig. 1). This wheel might also be named the leg wheel, or the walking wheel, from its appearance.

By publishing this invention, I am showing to our readers my "trump card"; for so important is a means of reducing the horse power required for traction on a common road to the same low amount (for the same load) as is required on a railway, that its general adoption would amount to a revolution in locomotion on common roads.

I am aware that others have tried to effect the same object; but one mistake has been to make the internal part of a wheel elastic; whereby the load only descends nearer to the ground, instead of the tire becoming uniformly flat next the ground, as is the case in this invention. In other designs the two wheels on each side have not been independant of each other, whereby guiding has been prevented.

In order to show that my object has been attained, I will explain why it is that so great a proportionate tractive power is required on the common road.

The common wheel acts somewhat after the manner of a cheese cutter, and grinds to powder annually millions of tons of road metal, and also falls into and has to be dragged out of every rut, little and big; this amounts to a lot of up-hill work, and accounts for the extra power required. By the adoption of my invention these evils are avoided; as there is always a base or foundation sufficient to make the tractive power no more than that of a railway on the same gradients—mind, I say, on the *same* gradients; which we know are more favorable on a railway.

To compare, let us suppose a cart has 5-foot wheels, and the tire to flatten one-eighth, or about 2 feet; width, say 4 inches; total surface bearing, 1 foot 4 inches; and, say, total weight, 1½ tons. Now, a locomotive engine will weight about twenty-four times this, which, ×1 foot 4 inches = 32 feet super, for sleepers, which, divided by say 5 sleepers, gives each 8 feet 7 inches long by 9 inches wide, which is not far from the truth.

The tires should be one piece of spring steel, tempered clock spring, of width and thickness as engineering data may dictate. The ends of the tire may be riveted to the bearing, same as the other three, but the ends must be shut into the dovetail, cast as part of *one* of the four bearings, which is shown at bottom of Fig. 2. The other parts of the tire should be *malleable* cast-iron.

Other advantages resulting are, that carriage springs are needless, the tires being themselves the springs; and all noise, jolting, and vibrations are done away with, so that the motion will be as easy as can well be imagined.—*J. H. Huxley, in English Mechanic.*

Fine Public Buildings.

Some fault has been found with Congress because of the liberal appropriation for fine buildings in various parts of the country. If, however, there is a surplus of money, it could not be much better employed than in constructing handsome edifices. Our post-offices, custom-houses, and court buildings should be structures worthy of what is destined to be the most powerful nation on the face of the globe. In eighteen years the United States will have as large a population as Germany and France combined, and there will be no richer nation potentially on the globe. The federal government does not come in immediate contact with the people except through custom-houses and post-offices, and it is desirable that our voting population should be duly impressed by the wealth and importance of the country to which they belong. There is no justification for any waste or extravagance, but it is manifestly unwise for federal buildings in any of the States to be cheap or mean structures. New York ought to have a superb custom-house, the finest in the world; a great emigrant depot should also be established in this city under the direct auspices of the federal government, for immigration is not a local but a national matter. Let Americans, wherever they go, see in every large city evidences of the might of the country to which they belong. In Athens, in its glory, architects, sculptors, and artists were not permitted to work for private persons. The State monopolized their services, and the government of the United States should be the especial patron of architects and builders of the better class.—*Real Estate Record.*

EVERYBODY'S COLUMN.

"FAS EST AB HOMTE DOCERI."

[While this column is open to all, farmers as well as mechanics, engineers as well as architects, we would call particular attention to one and all to have their questions and the information desired to be in accord, as far as possible, with the interests of this journal and for the carrying out of those principles for which the only monthly of its kind this side of the continent, was established. We will endeavor to answer all questions in a fair and impartial manner, and if it becomes necessary, will furnish cuts for the illustrations of any problem, provided we regard the solution thereof as beneficial to the majority of our readers. We would urge upon our patrons the necessity of being pointed in their questions, concise in the language used; let the writing be distinct, and one side of the paper only to be used; give full name and address, and particularly mention if their proper name shall be used.

We want it distinctly understood that the responsibility of signed articles rests with the authors.

Correspondents will please direct all communications to the business manager of this journal—240 Montgomery street, rooms 12 and 13.]

CALIFORNIA ARCHITECT: To find the length of rafters for a quarter pitch roof, I generally use the rule to allow 1½ inches to each foot of half width of building. This works well for short rafters, but does not do on long ones. What are the correct figures to use? S. L. T.

ANS.—The above is a very common rule used where accuracy is but little cared for. It makes the rafters about one half of an inch too long for each 8 feet in length. See our article on Steel Square and its Uses, page 95, this issue.

BUSINESS EDITOR OF ARCHITECT: I want to know of a *practical* way to describe the arc of a circle too large for a pair of dividers. Please inform me the best way of so doing.

MILLWRIGHT, Santa Clara.

ANS.—Let *a c* be the chord, and *o b* the hight of the required arc, as laid down *on the drawing*. On a separate piece of paper, *s e m n*, draw *a c*, *o b*, and *a b*, also *b e* parallel to the chord *a c*. It is well to make *b s* and *b e* a little longer than *a b*. Then cut off the paper carefully along the lines *s b* and *b e*, so as to leave remaining only the strip *s a b e m n*. Now if the straight sides '*s b* and *b e*' be applied to the drawing so that any parts of them shall touch at the same time the points *a* and *b*, or *b* and *c*, the point *b* on the strip will be in the circumference of the arc, and may be pricked off. Thus any number of points in the arc may be found, and afterwards united to form the curve.

In answer to E. M., we would say, that the reason he has never found the crushing strength of redwood given in the tables in different works on the crushing strength of materials, is simply because no extended experiments have been made (the results of which have come to our knowledge) of the comparative strength of redwood with other woods. Will inform our readers of such tests when made.

DELVING INTO THE SECRETS OF THE PAST.

The Lost Arts.

What are the Lost Arts? We often see allusions made to them; "few and far between"—only allusions. Sometimes we may hear some one art specified as a lost art. Nothing very definite, however, and always in a fragmentary way. When we come to give the subject serious study and investigation, we find many vague notions regarding the matter. Persons claiming to be well read speak of the Lost Arts, but are not able to say just what they are. If you, my reader, have a desire to find out by books or any other way what they are, just how many there are, who the people were who knew and practiced them, and at what period in history, you will have considerable of a task before you. Go to the best libraries on this coast, hunt through all the encyclopedias, through all the lexicons, phrase collections, art dictionaries, art histories, essays, monographs, and the whole gallery of magazine literature of the last score of years, and you will rise from that weary search, like Ruth from the fields of Boaz, with but few grains of wheat. You may then wonder if *anybody* knows anything about them. Possibly you may begin to conclude that the story is a myth. Are there any lost arts?

We once wandered over much of this wilderness. In our search we met a wise man whom we approached reverently, and asked hopefully, "Sire, what are the Lost Arts?" He adjusted his memory, and scanning the horizon of the illimitable past, he meditated. But memory came back with no treasure. He only said, "Go to Wendell Phillips—he knows."

Still seeking, I fell in with another wise man, in whom I had reposed much confidence; and I asked, "Sire, what are the Lost Arts?" He closed his eyes a moment and "looked backward." Then with a smile of pity he said, "Go to Wendell Phillips—he knows."

The labor is long, I see; but I will go on. In my search I saw another wise man, and I said, surely he will know; he seems to have traveled far; I went to him timidly, with doubt in my face, and said modestly, "Sire, what are the Lost Arts?" With a serious eye he looked upon me and replied: "Who knows except it be Wendell Phillips? His talk on 'The Lost Arts' will save you much weary seeking."

These wise men all know the same thing, I said. It must be true. Then I set myself to hunting "Phillips's Lost Arts." I remember with what unbounded hope, what expectant joy, I had once gone to sit at the feet of an Apollo, and hear him all through the long evening tell the touching story of "The Babes in the Wood"—that old tale that had so held spell-bound many a young eye in the gloaming; though my childhood had small share of such charm. The old castle, the dear boys, the silent, bad men, the great, dark wood, the pretty redbreasts—all were to come back again, I was sure. But, as you may know, they did not come.

Well, I found "Phillips's Lost Arts"; and it was, I thought, the "Babes in the Wood" over again. Amid the tropical wilderness of Mr. Phillips's beautiful flowers of thought and brilliant rhetoric, it was somewhat difficult to find the Lost Arts. Certainly, they were not catalogued. But it was a museum in which I could ramble. And Mr. Phillips whispered just then in my ear, "Egypt." Then I turned and looked toward the Nile. There was the Sphynx—lithograph of God—still sitting upon the sands where she had sat so long—so long—watching—watching with sad, earnest eyes. She has seen all—everything. She *knows* everything, I said. I will consult the oracle.

With what we can gather from such histories of Babylon and Ninevah and Thebes and Memphis as we have, and with such suggestions as may come from other sources, let us see what conclusion we may come to as to the Lost Arts.

If Mr. Phillips is correct in his statements, this nineteenth century, up to within the last ten years, has enjoyed little art and few inventions that Egypt and Assyria and Greece and Rome did not know—know better, even, than do we. Has all art been once lost, then? Have these ancient peoples, as he says, anticipated us in every form of art and beauty, even to our stories, our dramatic plots, and our Irish bulls?

It has been supposed, until comparatively recent times, that transparent glass was not known to the ancients. Glass is said, by Roman writers, to have been discovered by accident by the Phœnicians on the Syrian coast. Wilkinson suggests that it is more likely to have been in Egypt, where the materials for glass abound. Real glass was certainly known to the Egyptians at least 4,000 years ago. They did not use it for windows, it is true, for they did not need them; but they did use it for drinking and cooking vessels, for ornaments, and for other purposes. Cut glass was invented by Lehman, an Austrian, at Prague, about 1600. But cut glass and ground glass and glass blown into all shapes required have been found in the tombs of Egypt and the chambers of buried Pompeii. Glass vessels found in Rome, Greece, and Etruria are by shape and pattern known to be Egyptian. So the making of cut glass was a lost art, though making transparent glass may not be.

The Egyptians had the art of introducing different colors into a vessel, which has never been attained by modern workers in glass, with all the improvements that have been made. The best Venetian artists have not reached the Egyptian secret.

Sometimes these bright colors are interlined with gold—blue, green, red, and gold alternating. These were not on the surface, but all passed vertically through the entire substance, so that horizontal sections showed the same pattern. They were mosaics in glass, supposed to have been made by fusing delicate rods of colored glass. Birds and other animal were thus made to perfection in solid glass, the pattern running through and showing the same on both sides, as if cut out of a solid block of colors. The designs of these patterns are often so delicate that parts of figures can be detected only by a lens. Under the microscope, the iridescent colors on a duck's neck can be seen. Such art has never been attained in modern times, we think.

They had the art, also, of engraving on gems: probably done with the diamond. In the museums of Rome and other cities of Europe may be seen seal-rings from Egypt, having engravings of the human figure and other forms too small to be clearly seen by the naked eye. There is a ring shown in the museum at Parma, once worn by Michael Angelo, that has on it an engraving of seven women, the figures so small that they cannot be distinguished without a glass. Mr. Phillips mentions one of this kind Hercules, the interlacing muscles of which, and the separate hairs on the eyebrows, could be seen, under the microscope. Rawlinson speaks of a stone from Ninevah, only twenty inches long and ten wide, that contained an entire treatise on mathematics. Cicero, quoted by Phillips, says he saw the entire Illiad of Homer written on a skin that could be put into a common nutshell. It is inconceivable that engraving or writing so minute and delicate could be made without the aid of lenses. In fact, lenses have been found in the Assyrian excavations, and doubtless were used in Egypt. But the microscope is a modern European invention. So the knowledge of it must have been lost.

What the famous Murrhine vases were, we do not know. The Roman writers describe them as Assyrian, and made of a stone found only in Asia. It was of many colors, beautifully blended and iridescent. It has been suggested that it was *fluor-spar*. The Egyptians imitated it in their glass-porcelain.

The Egyptians also had the skill to imitate the finer precious stones. The immense emeralds spoken of by ancient writers are doubtless imitations in glass, as no such stones have ever since been found or known in a natural state. One is named as being six feet long and four and a half feet broad. A statue formed from one stone was thirteen and a half feet high. An obelisk named was sixty feet high, made of four emeralds. To form such figures of glass showed greater skill, even, than to imitate the natural stones. They imitated the colors of all the finer gems—the emerald, the amethyst, the ruby, the sapphire—to the minutest tint, in all their glowing beauty and radiance, so perfectly as to deceive, not only the common people, but the expert; and made pearls that no unaided eye can distinguish from the natural ones. Such art has not since been seen.

The Egyptians were noted for their manufactures of linen, cotton, and woolen cloths; also, for embroidery. These were of such excellence that they were in demand in foreign countries. Cloth of cotton and linen mixed was also made. The wonder is, that the thread was spun and the cloth woven by means, apparently, of the simplest and rudest machinery. The skill that could produce the fabrics described by ancient writers, on such looms as are figured on the monuments where is seen the actual process of construction, is simply marvelous. And we do not see their best products either, for these were not consigned to the tombs. The beauty of the fine, costly clothing of the rich people of Thebes and Memphis has never been seen—at least, since the glory of Rome declined. It can never be known. Perhaps it perished with the people. A singular feature of those cloths was that the warp had double, treble, or even quadruple the number of threads that the woof had. A specimen in the British museum is thin, transparent, and very delicate in texture. It has 140 threads to the inch in the warp, and 64 in the woof; and the thread is so fine that it required 100 hanks to weigh one pound. There is a specimen of Indian manufacture, shown at the East India house, spun by hand, that required 250 hanks to weigh a pound. Some of these fabrics used for scarfs are fringed like our silk shawls, and woven with a selvage. Some are ornamented with stripes of indigo-blue and fawn color, the thread being colored before weaving. A specimen found near the old city of Memphis surpasses all others in fineness, having 270 double threads, equal to 540 single threads, to the inch. Its color is a brown, and it is covered with hieroglyphics so finely drawn that the lines can scarcely be traced by the eye. The threads are perfectly even—not a break or knot, as is seen in our best cambrics. The feeling of these linen cloths to the touch is like that of our silk. They had nets, also, for catching fish and birds, of such fineness of structure, that one of them could be drawn through a finger-ring, and each single thread was made up of 150 finer threads. Amasis, King of Egypt, had a corselet the threads of which were formed of 365 distinct threads. It was ornamented with figures of animals worked in threads of gold. Pliny says that the king sent several of these as presents to the Greek rulers. Many of the cloths of Egypt had patterns worked in colors on the loom, as well as those made by the dyeing or printing process. These rivaled the famous fabrics of Babylon, worked with the needle. The invention of weaving threads of gold and silver is said to have been made in Asia. But the art was early known in Egypt, or nearly 4,000 years ago. It was carried to Greece and Rome, and writers

speak of tunics made wholly of threads of gold, worn by Agripina, Tarquin, and Heliogabulus. All these textures were made by means of implements that we should call barbarous. We may safely say that such art and skill have not been seen since the decline of the Roman empire.

The Egyptians knew how to dye by chemical processes; for they used acids to make the cloth take the color equally, and also to change the color, to give any color they wished. The bright colors used were blue, scarlet, and purple. These are immortal. They have never faded. They are as bright to-day, seemingly, as when laid on. How they made them so, we do not know. *We* cannot make them, that is certain. In the tombs of Egypt, in the ruins of Babylon, in the buried chambers of Pompeii and Cyprus, the royal purple and scarlet still flame out when brought to light, as they did 2,000 or 3,000 years ago. Even in later times, only 500 years ago, the illuminated missal of the monk shows a color we cannot now produce. Ruskin, lecturing to his art students, says: "We English think we are the best chemists in the world; but we cannot make such a scarlet." The French at Lyons say, "We are the best dyers in Europe"; but the girls in Cashmere will show them three hundred distinct shades that they cannot make, or even hardly distinguish—so Mr. Phillips says.

It is said that the oriental eye can distinguish shades that no western vision can detect. This may explain the Cashmere story; but the art to produce the fadeless colors of Thebes and Ninevah is, we think, a lost art.

By our common chronology, over 3,000 years before the Christian era metals were used in Asia. Mr. Phillips says, "They can work more wonders in them there to-day than we can, and they have always done so." He says again, "When the English plundered the Summer Palace of the Emperor of China, they were astonished at the curiously wrought metal vessels of every kind, far exceeding in skill the work of any people in Europe." It has been thought that English steel is the best in the world. But the first quality of English steel put into a chronometer watch or a surgeon's lancet will rust in the climate of India. "Metallurgy is the glory of chemistry," says Phillips; "and the best steel is the triumph of metallurgy; perfect steel is the marvel of science." Now Sheffield is the great center of the English steel manufacture; but when, to-day, a watchmaker in London wishes the best steel, he has learned to send, not to this scientific center, but to the Punjaub of India, where there is no science at all. Oriental steel has been noted through all history. The Indian steel and Damascus steel do not rust. A Damascus blade can be twisted like a corkscrew, and the point made to touch the hilt, and it shines to-day as it did a thousand years ago.

Then, oriental steel will take an edge that no English or Swedish steel will. A Hindoo, says Phillips, will cut floss silk, floating in the air, with his saber. And he tells the story of Saladin, who drew his keen blade across an eider-down pillow, and laid it in two pieces; and severed a scarf, floating almost like gossamer, before it could reach the floor. "Now," he says, "we can produce nothing like this." Then we must say that the art of producing oriental steel and a Damascus blade are lost arts.

Then there are the wonders of the mechanical powers that the Egyptians used with such marvelous results. These results have never been explained. No one can tell the secret. They are unaccountable. We have steam hydraulic power, and many forms of combination of the simple mechanic powers. They had the lever, the inclined plane, and the pulley. How they, with these simple tools, could do the work they did, we don't know. It is a lost art. We can move the obelisk, true. They cut it out of the quarry in one piece, and carried it 150 miles, sometimes 800 miles, and so far as we can know, by help of their own illustrations, only with the aid of the above rude instruments. Herodotus says they used a crane. Possibly, at any rate they hung the capital of Pompey's Pillar, weighing 2,000 pounds, 100 feet high. The weight of the obelisk before the temple of Karnak, the greatest in Egypt, is given by Wilkinson as 300 tons. There are colossal figures that weighed over 800 tons; and a monolith is named that weighed 5,000 tons. The obelisks sometimes were more than 90 feet long They could not draw them straight out, on account of the narrow entrance to the quarry. They had to lift them bodily from their bed, and swing them clear. They lifted stones 40 feet long to the top of the doors and to the roofs of their largest temples; all this they did with their primitive machinery. Wilkinson says no insight by their paintings or their sculpture is given into the secret of their mechanical knowledge. So we leave it. We can only read and wonder. It is a lost art.

These are some of the lost arts. There are doubtless many others. Unless we know what ones have been continued through all ages, or at what period certain inventions and discoveries have been made, we cannot always say what are lost arts and what are not. The Hebrews learned many of the arts from the Egyptians and have carried the knowledge to every nation. Some were transmitted from Egypt and Assyria to Greece and Rome, some went out of sight with the decline and fall of these empires, and some were taken up by the races that overran Rome, and so have been perpetuated. The Egyptians understood much of geometry and astronomy, we know. All of what they knew in these sciences has never been communicated to others—at least, has not reached modern times. If they knew all the geometry and astronomy that Smith gives them credit for in his history of the great pyramid, then much of their skill is a lost art. He says they really squared the circle. No modern has ever worked this problem; so that is a lost art.

There are many other things that we have been accustomed to consider modern discoveries, and which have been set down to the credit of modern superiority of ingenuity and invention; notably among these are the steam engine, the railroad, electricity, the telescope. But Wendell Phillips says they had all these in Egypt. He says a French engineer saw the painting of a ship full of machinery, the arrangement of which could be accounted for only on the supposition that steam was the motive power. He says they had canals superior to the Suez Canal; that complete systems of ventilation were used and fully understood by them; that Solomon's Temple was protected by a system of lightning rods. Syphons were invented in Egypt, at least 1,500 years before Christ; and the bellows was in use as early as that. So, says Mr. Phillips, of all the discoveries and inventions of this boasting nineteenth century, ninety-nine in a hundred have been anticipated by the ancients. This is too sweeping, we think; we do not think all the statements can be fully verified. They doubtless knew more than we perhaps credit them with; and they had knowledge of some arts that we have never known—Lost Arts.

To sum up, these are some of them: Mosaics in glass; the introducing animals in colors into solid glass, the figure running through, both sides showing the same; the making of the Murrhine vases; artificial precious stones of mammoth sizes; manufacture of linen cloth that rivaled silk, and cloth of gold thread on machines of simplest construction, and then covered with figures the lines of which are so delicate that the eye can scarcely trace them; large fish nets of such fine texture as to be drawn through a finger-ring; producing colors that have not faded in nearly 4,000 years; metal vessels from China, that surpass the skill of any people in Europe or America; oriental steel seen in a Damascus blade and a Hindoo cimeter; malleable glass, that Prof. Silliman declares to be a physical impossibility that no amount of evidence will convince him of; glass vessels found in China, though not Chinese, that are miracles of skill, and inexplicable; chemistry that has not even been approached in modern times; mechanic powers that are simply marvels that cannot be explained; and if the statements in regard to their building on astronomical principles the great pyramid are correct, they had a knowledge that would seem must have come by divine revelation. Such are the Lost Arts.

The Willow as a Timber Tree.

And there are some trees which are deserving of more attention than has yet been given them in this country. The willows, for instance, have seldom been cultivated in a large way; and yet there are few trees so easily grown, or which will pay better for cultivation. They adapt themselves to a wide range of soil and climate. They grow on high ground and on gravelly soils not less than by the sides of streams, where we most commonly see them. They are of rapid growth, and yield a large return. The osier-willow is especially useful, we know, for the manufacture of baskets, chairs, and other articles of furniture, and we import it to the extent of $5,000,000 annually, when we might produce it easily in almost any part of our country. We hardly think of the willow as a timber tree or for the production of lumber, but only as yielding a cheap, poor sort of fuel. But in England the wood is greatly prized for many purposes. While it is light, it is also tough; it does not break into slivers. Hardly any wood is so good, therefore, for the lining of carts and wagons used in drawing stone or other rough and heavy articles. It makes excellent charcoal, especially for the manufacture of gunpowder. It bears exposure to the weather, and boards make of it are very serviceable for fences. Some species of it are admirable for use as a live fence or hedge. On account of its comparative incombustibility, the willow is eminently useful for the floors of buildings designed to be fire-proof. It grows to a large size and furnishes a great amount of lumber. There is a white willow growing at Stockbridge, Mass., which at four feet from the ground measures twenty-two feet in circumference, and extends its branches sixty feet in every direction. Tradition says it was brought from Connecticut in 1807 by a traveler, who used it as a riding switch. The Hon. Jesse W. Fell, in giving an account of experiments in tree-planting on an extensive scale in Illinois, says: "Were I called upon to designate one tree, which, more than all others, I would recommend for general planting, I would say unhesitatingly it should be the white willow." Prof. Brewer says: "In England, where it is often sixty to seventy feet high in twenty years, there is no wood in greater demand than good willow. It is light, very tough, soft, takes a good finish, will bear more pounding and knocks than any other wood grown there, and hence is used for cricket bats, for floats to paddle-wheels of steamers, and brake-blocks on cars It is used extensively for turning, planking coasting vessels, furniture, ox-yokes, wooden legs, shoe-lasts, etc." Fuller says: "It groweth incredibly fast—it being a by-word that the profit by willows will buy the owner a horse before that by other trees will pay for a saddle." The basket willow, well cultivated, will yield a net income of $150 a year to the acre. On the whole, therefore, it would seem that the various kinds of willow, the economic value of which has been hitherto entirely overlooked in our country, are eminently deserving of attention, and will amply reward those who cultivate them.—*Popular Science Monthly.*

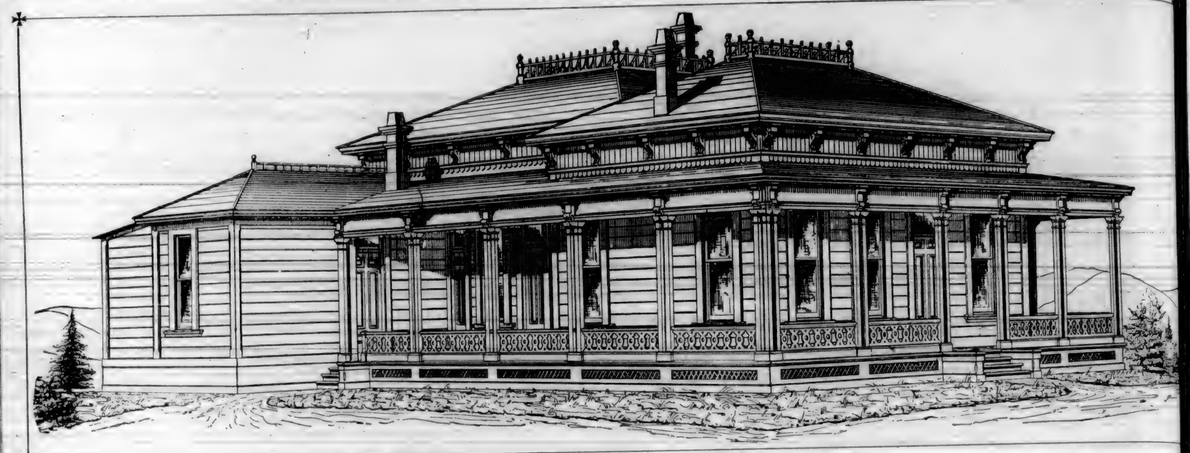

PLATE 1.—PERSPECTIVE VIEW OF COUNTRY DWELLING.

Our Illustrations.

Plate 1 is the perspective of a very convenient country house; Plate 2 being the front elevation, and Plate 3 the side elevation. It is the intention to make a large attic over the dining and sitting room portions of the building, to be used for a store-room and the apartments of the "hired help" during the harvest season. Plate 4 is the ground plan.

Garfield Memorial.

EASTERN COMMENTS.

We advise our young readers who are sometimes tempted to throw away their time and reputation by entering into second-rate competitions, to read in the CALIFORNIA ARCHITECT AND BUILDING NEWS the comments upon the designs submitted for the Garfield Memorial which the people of California are intending to erect. As every one may not have heard of this artistic event—the most important one in the history of the Pacific Coast—we ought, perhaps, to premise that some months ago circulars were sent out announcing that it was in contemplation to spend some twenty-five thousand dollars, if we recollect rightly, upon a monument which should do honor at once to our late lamented President and the people of California, and inviting competitive designs for the structure, upon terms the most discreditable to the individuals offerings them, and the most degrading to those foolish enough to accept them, which we ever saw in print, except, perhaps, those set forth in the amazing invitations by which State house commissioners south of Mason and Dixon's line encourage the fine arts. In brief, all the persons desirous of immortalizing their names in connection with the California Garfield Memorial were required to furnish full working-drawings, specifications, and details, the proper value of which should be at least fifteen hundred dollars for each set, and were promised in return that *one* among them *might* be chosen to receive the magnificent sum of three hundred dollars, for which he would be obliged to abandon his drawings, papers, and models absolutely to the committee, and sign a receipt in full of all claims and demands. Although architects are popularly supposed to have an idiotic passion for doing work for nothing, even the Californians, unaccustomed as they are to such contests, were attracted by the disparity between the service asked for and its reward, and have come by insensible degrees, as the extract well shows, to look upon the competition as a farcical combat between objects of deserved ridicule, whose struggles after a preposterously inadequate prize afford legitimate sport to the more rational lookers-on. To a certain extent their opinion is justified, and although we can pity the folly of those who responded to the almost insulting invitation, we must condemn them as having done what they could, not only to lower themselves and cloud their own future prospects, but to degrade and injure the profession to which they claim to belong; and it will do no harm for the Californians to consider at the same time, while they are laughing at the "Nightmare-Mauresco-Japanese" models offered for their choice, whether the mode which they have adopted for securing a design for their costly monument without paying the designer seems likely to prove entirely successful.—*American Architect.*

Laying Walnut Veneer.

First have the veneer and the surface to be veneered very smooth, by going over with a fine toothing plane to make out all saw marks. The veneer must be left a little larger than the surface to be covered. The wood—not veneer—must be well mixed with thin glue; you can do this by dipping the brush in the glue and then in the boiling water, and then allowed to dry. Have very good glue, boiling hot, laid on the wood and veneer, lay the one on the other, and then well press together, having first damped that side of the veneer not to be glued with hot boiling water by a sponge. If a large piece, it will require a hot iron run over the surface to keep it down. It will all spoil if the iron is too hot. It must be clamped or weighted by laying boards on all night.

Latest Work on Architecture.

Palliser's American Cottage Homes, illustrated by 260 drawings, with forms of contract, specifications, sections, details, etc. We are the only agents for this new work on this coast. On receipt of the publishers price, $5, we will forward a copy to any address.

Interiors and Interior Details.

The most valuable work on MODERN DETAILS that has as yet been issued. "CALIFORNIA MUST COME TO THE NEW STYLE" is the decision of the publishers; and they have excelled themselves in producing a work that should of necessity be found in the library of every architect. Publishers' price $7.50, for which we will send the above work to any address.

Making Artificial Stone.

A compound for artificial stone, which has received late protection by patent, consists of three and one-half parts of clean sand to one part of Portland cement, mixed thoroughly, and combined in a working consistency with a composition consisting on the one part of five gallons of water, and on the other part of one gallon of the mixture made of the following ingredients and in the following proportions, to wit: one gallon of silicate of soda, one pound of carbonate of iron, one and a half pounds of graphite, two pounds of raw umber, and two gallons of rain water at the boiling temperature, and all thoroughly mixed.

American Cottage Homes.

A very valuable work containing 40 plates, 9x12 inches, with over 260 drawings, of low-priced cottages and workingmen's homes. It also contains forms of contracts, specifications, and a full description of each plate. Sent to any address upon receipt of $5.

Glue that will resist water, it is said, may be produced by boiling one pound of glue in two quarts of skimmed milk.

IVES' PATENT DOOR BOLTS.

Sold by all Hardware Dealers.

(APPLIED WHOLLY BY BORING.)

LEVI STRAUSS & Co., Importers, 14 and 16 Battery Street,
SAN FRANCISCO, March 4, 1881.

MESSRS. P. H. JACKSON & Co., No. 2 California Street:

The alteration made by you by cutting out the six door sills and risers on the front part of our store, 14 and 16 Battery Street, and substituting HYATT'S PATENT ILLUMINATING ROOF, is quite satisfactory in making in the basement apartment below, in the front part, all that we could desire as regards light. **Our entry clerks are now able to work without the use of gas.**

LEVI STRAUSS & CO.

The **Basements of Messrs. Murphy, Grant & Co's Buildings,** on Bush and Sansome Streets, have been altered and are now lighted by this Improvement.

HYATT'S PATENT

FIRE AND BURGLAR-PROOF SKYLIGHTS.

The Public are requested to examine the **large quarter circle** skylights, recently erected in the rear of **Senator Fair's** building corner Sansome and Pine. Also **A. B. McCreery's** building corner of Pine and Davis. By the use of these heavy Skylights, which are both fire and burglar-proof, **no extra charge in rates is made by the Insurance Companies than if no Sky-lights were used,** as they are not destroyed by fire, like the wood and sheet-iron skylights in common use; besides the occupant of the premises may feel his goods are safe from robbers during the time the building may be closed.

☞There are many deep stores in this city that are much in need of light, and by an addition of these Skylights all light can be obtained, besides security againt thieves is maintained.

The appearance of the Skylight, as seen from the front of the store when the sun is on it, glistens with the thousands of hexagon lens. The Cosmopolitan Building, as altered, has these Skylights on the rear of the deep stores.

McGlashan's Train Telegraph.

The above cut is an illustration of an incalculable beneficial invention made by C. F. McGlashan of Santa Barbara, California. It is the object of the inventor to furnish a practical method of establishing constant telegraphic communication between any number of moving railway trains and any number of stations. By its use, conductors are enabled to tell the exact location of other trains on the same track, thus doing away with any possibility of accident by the collisions of moving trains.

The cut shows a side view of truck, posts, and wires. The posts are ordinary telegraph posts, set from four to twenty feet from the railroad tract, and at distances of from sixty to one hundred feet apart. Beams one and a half feet long project inward from the top of the posts toward the track, and from these the wires are supported above and alongside the tract about sixteen feet from the ground. The hight of the wires is immaterial except when directly over the side of the car, when they must clear the head of a person climbing up the side ladder of a car. The truck is drawn along by the moving railway car, by means of a rubber tube. The two halves or sides of the truck are insulated from each other, and from each side a wire passes down through the rubber tube into the car (not shown), and is attached to the usual telegraphic instruments, consisting of key, sounder, and relay. The bracings of the truck are entirely beneath the wires.

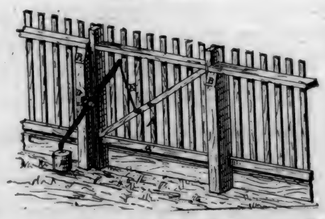
In the tube are two wires which may be attached to any portion of the braces of either side, as the electric current is communicated through the wheels simultaneously to any portion of the metallic braces. The upper wheels are from twelve to eighteen inches in diameter, and are provided with self-lubricating boxes. The lower wheels may be much smaller than represented, as their only office is to assist in clasping the wires, and in preventing the possibility of the truck's jumping the track. The tube passes around a drum in the car, which is provided with a spring which takes up all slack. In case of the derailing of the car, the tube lengthens out to any desired extent, so that no damage will be done to either truck or wires.

On March 25th the practical utility of the invention was tried on the S. P. R. R. The trial was a perfect success. The truck in passing the supports did not make the slightest perceptible halt. Perfect communication was kept up by the following process: Battery wires are attached to opposite end of each main wire, the other end of each wire remaining "open." The current passes up one battery wire to the main wire, along which it passes to the truck drawn by the moving train. Communicating with the metallic wheels and braces on this side, it descends one of the insulating wires contained in the tube, to the instruments in the car. After passing through these instruments, it ascends the other wire contained in the tube, to the other side of the truck, and the other main wire, along which it passes to the other or farther battery wire. Each battery wire is connected with ordinary telegraphic instruments and with ground wires. The circuit is completed through the earth.

The weight of the truck, actual size, used in the experiment was ten pounds, yet it glided along so smoothly that its tension never at any time exceeded three pounds. The inventor, in answer to an objection that the cost of wires and poles is great, replies that safeguards to life and property are not costly at any price. He adds that his "train telegraph" will give train dispatchers absolute control over train men, and nothing will be left to their judgment, and train men will thus become what railroad men desire, machines to run by order. Each truck is provided with scrapers and knives to keep these wires clear of obstructions, and so fitted are the trucks that they cannot be torn from the wires.

We shall watch the full development of this invention with much interest, and will lay before our readers, from time to time, articles of interest in connection with it, so that full justice may be done to a worthy California inventor.

Gate-Closer.



The bearing *D* is fixed to the gate-post *B* in an inclined position, and the lever *C* has a journal *c* pivoted on the incline bearing. Its position is such that when the gate is opened the lever moves around the post. At *F* is shown the weight, and at *E* the line connecting the lever with the gate. Henry Gross, Tiffin, Ohio, is the patentee.

Maple for Cabinet-Work.

Almost every one knows something about maples, but very few, even of experienced cabinet-makers and carpenters, ever think of these woods as being available for anything but firewood, or, perhaps, for the making of some delicate box where white holly is not available. The white maple (*acer rubrum*) is one of the whitest woods growing in this country, only exceeded in that respect by one or two. It is, however, on account of its extreme softness and general lack of strength, practically valueless. The sugar maple (*acer saccharinum*) is one of the most useful trees we have. While it is very cheap in our markets, we cannot consider that it is a valueless tree, this low price of the timber resulting from the fact that it is not fashionable, and has not been used to any extent for anything save mill-work and rough carpentry. Its grain is very fine, and, in hardness and general adaptability for fine carving and cabinet-work, stands next to box-wood. Beech somewhat exceeds it in the fineness of grain, but is not nearly so beautiful. The great strength of maple renders it valuable in all kinds of delicate work, preventing it from being readily broken, and, at the same time, allowing a slenderness of construction quite inconsistent with any weaker material. Almost all maple has in its structure a certain waviness which causes it, when polished, to reflect light and to appear almost dapple. Other varieties are the well-known bird's-eye maple, which, thirty or forty years ago, was a very popular wood for certain kinds of cabinet-work. Many persons suppose that the bird's-eye maple is a separate or peculiar tree, differing from other maples. This is a mistake. Most of the rock-maples have a tendency to form little hillocks beneath the bark, and each layer of wood during growth is evenly covered over with these projections, which do not grow larger, but retain their original size. The result of this is, that when a slice is taken through one of these little lumps or pits, we find that the grain of the wood is bent up or down in a circle, and, of course, reflects the light differently from that part which is horizontal. In what are called bird's-eye maple trees, these little hillocks or pits in the bark are disposed closely together and regularly throughout the tree. In opening such a tree, when the cut is parallel to the bark, we have a board showing the bird's-eye maple markings. If, however, the cut is made radially, it passes through the hillocks vertically, and, as they extend from the heart to the bark of the tree, we have something which produces upon the wood the effect of a wave. When a log is sawn so as to show the eyes, it is known as bird's-eye maple; and when cut radially, so as to make the waves most prominent, it is called waved maple, or, in some places, curly maple. The wave pattern will almost always be found in any bird's-eye board by looking at the edge, and *vice versa*. Maple has one advantage which has been improved very little by cabinet-makers, and that is its susceptibility to staining processes. The wood is capable not only of being ebonized, but of taking several very beautiful colors. We have seen bird's-eye maple for small work stained to a very beautiful drab, which harmonizes well with both furniture and decorations. The supply of this wood is abundant, and, fortunately, can be obtained in large size. Hitherto its principal value has been for fire-wood.—*Furniture Gazette.*

Steel Square Problems.

A new work expaining the uses of the Steel Square. Sent post-paid to any address upon receipt of 50 cents.

The American Workingman.

Dr. Lyon Playfair, one of the most prominent of Englishmen of science, and a member of Parliament, who has lately returned to his native country from a tour in the United States, has published some of the results of his observations of men and things in this country, which convey some very instructive and suggestive statements bearing upon the industrial future of the United States. Coming as they do from a representative Englishman, of large views, thoroughly competent by reason of his intimate familiarity with the industries of his own country, and favored with every facility for obtaining accurate information, Mr. Playfair's opinions are of special interest.

Mr. Playfair publishes in a recent number of *Macmillan's Magazine* a paper entitled, "Industries of the United States in Relation to the Tariff," in which we find some material for future consideration, and some comments on the position of the workingman in the manufacturing States, which last specially interests us here. We shall give, therefore, in the following a brief summary of the author's impressions on this subject:

Mr. Playfair states that the true American mechanic, by descent, education, and training, is excellently adapted to his work. His chief center is in New England, though he is rapidly spreading everywhere. The original settlers in New England were men of strong will, and above the average of the old country in education and enterprise. Their early love for education is shown in the fact that soon after their settlement they established Harvard College. These men landed on a rough, inhospitable coast covered with wood, and they had few tools with which to conquer nature. They were obliged to be men of many resources. In possession perhaps of a single tool, they turned it to many purposes, and if it did not suit they altered it. This reliance, inventiveness, and industrial application developed together.

The soil of the New England States is the poorest for agricultural purposes, while the climate is not sufficiently changeable for a large variety of crops. The rocky and poor soil upon which the early settlers landed forced the increasing population into manufactures and commerce, so that they acquired habits of industry and thrift. As they gradually extended westwards and southwards, better climate, land, and raw material opened up new sources of wealth, and the qualities acquired by the first colonists enabled their descendants to take advantage of improved conditions.

The New Englanders never forgot that their superior education had been of powerful assistance to them as early settlers, and they kept up knowledge among their descendants. It is a rule among Americans that the school-house must precede the factory, and that capital applied to industry without knowledge is worthless.

Even the Puritan sense of religion, Mr. Playfair believes, has had great effect on manufactures. The commandment, "Thou shalt not steal," is carried out in manufactures. When cotton goods are sold, the material is wholly cotton, and is not weighted with China clay or sulphate of baryta. The 600,000 muskets sent out to Turkey during the war were made to shoot and not to sell.

American goods, he affirms, are dear, but they are true and good. The example of New England spreads over the Union, and has produced an honest and efficient workman everywhere. The high price of labor gave a great stimulus to the invention of labor-saving machinery, while the patent laws wisely encouraged inventions.

Thus, the true American mechanic is generally superior to, though not dearer than, the mechanics who enter by immigration. He is too dear for inferior work. But even in the case of imported labor, American industry has a great advantage over other countries. The emigrant arrives in the full power of production, while the country which sent him forth had to pay for his childhood during the years in which he possessed no productive value.—*Builder and Woodworker.*

Market Reports.

LUMBER.—Stirring times with steady demand is all that can be said of the market the past month.

Receipts since January 1st, 1882:

Lumber	80,417,261
Shingles	14,321,761
Laths	7,611,100

PAINTS.—A new company has made its appearance, introducing the OMAHA WHITE LEAD. With the large demand that is confidently expected this year, the agents should be able to control a fair amount of patronage.

The PIONEER brand has been successfully introduced into every town and hamlet on the Pacific coast, and has given universal satisfaction. We quote price at 8 cts. per lb. and 7¾ cts. in "ton" lots.

Building Intelligence.

SAN FRANCISCO.

Operations continue brisk both in city and country. We hear of many improvements to be made by our farmers after the harvest is over. Mechanics are scarce.

Owing to the large number of buildings at present being erected, we have deemed it necessary to abbreviate the terms used. Hence in this and in future issues the following letters will have the accompanying meaning: *A.*, architect; *C.*, contractor; *O.*, owner; *O.* and *B.*, owner and builder. The points of compass by E., W., N., and S.

In our last issue the building reported on corner Clay and Van Ness avenue, the cost was given as $3,500. *It should have been* $35,000. *O., Steison; A., H. C. Macy.*

Five-story and basement brick building corner Turk and Mason. *O.*, Schroth & Westerfield; *A.*, A. Schroepfer; brick work, G. T. Waterson; carpenter work, G. B. Wilcox; cost, $46,000.

Corner Dolores and Sixteenth streets, nave and tower to church. *O.*, St. Francis Society; *A.*, P. Huerne; carpenter work, Glenan & McManus; brick work, O. E. Brady; cost, $30,000.

Additions and alterations to frame dwelling N. W. corner Van Ness and California. *O.*, Mrs. Pope; *A.*, Wright & Sanders; day's work; cost, $10,000.

Three-story frame addition to building S. W. corner Bush and Stockton. *O.*, J. Hugg; *A.*, V. Hoffmann; *C.*, G. Krohn; cost, $17,500.

Three-story and basement brick building on Mission street, between Second and Third. *O.*, Otto Muser; *A.*, Curlett & Eisen; *C.*, Ellis & Kincaid; cost, $12,000.

Two two-story and basement frame dwellings on E. side Leavenworth, between Eddy and Turk. *A.*, C. J. Wingerter; *A.*, V. Hoffmann; *C.*, Hutchinson & McLean; cost, $12,000.

Two-story and basement frame dwelling on W. side Leavenworth, between Eddy and Turk. *O.*, C. J. Wingerter; *A.*, V. Hoffmann; *C.*, Hutchinson & McLean; cost, $6,000.

Additions to three-story brick building, Pine, between Front and Davis. *O.*, Gen. Kirkham; *A.*, J. P. Gaynor; *C.*, — Pratt; cost, $4,000.

San Francisco's Garfield Monument.

The committee having the matter in hand have decided the awards of premiums, and selected and adopted the design which they have been pleased to denominate the best of the more than twenty designs and models submitted. In this they have defied the opinions and criticisms of the press and public, and virtually asserted that they, as a committe, were masters of the situation, and were endowed with æsthetic discrimination and wisdom far greater than the thousands of contributors and others who failed to discover intrinsic merit in any of the designs presented sufficient to warrant adoption.

But the committee having the authority to act, and there being no power greater to restrain their actions, they have bravely resisted the will and pleasure of the greater number, and carried out their own views. How far this course may redound to the credit of the gentlemen of the committee remains to be seen; but during the lifetime of many now living, the monument, when erected, will be looked upon by hundreds as one of the errors of the period, although the masses may forget the circumstances surrounding the procurement and adoption of the design, and may admire it for what it is worth, remembering more the grandeur of the character to whose memory it will be dedicated than the mistakes of the men who manipulated its erection.

In addition to the ill-advised course pursued by the committee in the matter of premiums, the withholding of superintendence, etc., a wide breach of equity was permitted, in allowing those who wished to submit models in competition with drawings, thereby giving a large advantage to the model contestants. Had the design presented in the model adopted been reduced to a paper drawing, it is questionable whether it would have received the first award. On paper it might not have made so good an impression; while if two or three of the paper designs had been worked up into models they would quite as likely have been preferred.

Another injustice was done, even as far as the models were concerned. That submitted by Mr. Wells certainly possessed considerable if not equal merit with that of Mr. Happensberger, whose model design received the first premium. But the latter was larger and more imposing in appearance, and in size overshadowed that of Mr. Wells. So that in a multiplicity of ways, the affair has been a series of errors.

If the committee had been composed of men qualified for the duties assigned it, they would have established such qualities as would have made matters work fairly between all parties: such as prescribing that all designs should be in drawings, or all models; and if the latter, then the size and proportion should have been regulated, as no one but the committee could prescribe and regulate that feature. It was not possible for the contestants to fix a standard, each working according to his own judgment, and so far rendering it a matter of chance as to who should happen to hit upon the more acceptable and captivating proportions. However, the matter is ended by the adoption of a design which will look very nice when completed, and some may think it beautiful, and perchance we may be among its admirers when we shall have forgotten the questionable and unfair procedure of the committee, and also lost sight of the fact of how much more handsome a design might have been obtained.

We have no personal acquaintance with Mr. Happensberger, nor any sentiment or feeling adverse to that gentleman, and we congratulate him upon his success, and hope that he may be successful in every undertaking of his life. And we are also right heartily glad that California has produced a man to the manor born, to bear off so enviable a prize.

Our Modesty, and a Subscription Boom.

A sense of delicacy on our part restrains us from urging and pressing our claims for patronage to the extent justified by the facts surrounding and entering into our publication work.

That we have succeeded in producing and establishing upon a permanent basis in San Francisco a journal which ranks most favorably with the *best of like publications* east of the Sierra Mountains is fully confirmed by the voluntary credit bestowed upon us from all quarters of the United States, and from countries beyond the broad Atlantic and Pacific oceans.

And if this be true, as true it is, then we hold that the people of the Pacific Coast should rally as one man to our support, and at once increase the number of regular paying subscribers beyond all parallel in publication ventures of this character.

NOT ONLY ARCHITECTS, nearly all of whom in California favor us with their subscription, and like good and true men—with two or three exceptions—promptly pay the $2 yearly subscription; NOT ONLY CONTRACTORS, hundreds of whom are among our prompt paying patrons; NOT ONLY JOURNEYMEN MECHANICS, multitudes of whom are anxious for the date of publication to roll round, that they may reap the information and instruction to be found in each succeeding number, a large majority of whom PAY LIKE HONEST MEN for what they receive, while the lesser number, who waste a hundred times the amount of each year's subscription in the baser pastimes of beer-drinking and corner-grocery allurements, preferring to pilfer and obtain the wealth of our columns at our expense, or the expense of those who entertain the opinion that a journal worth reading is worth the coin, and should be paid for: but every OWNER OF REAL ESTATE, whether improved or unimproved, all HEADS OF FAMILIES, and ALL CLASSES OF PERSONS, without distinction as to calling or occupation, should subscribe for this journal, because it contains matter and information not to be found in any other journal published within the Pacific States, and of a character full of vital importance and deep interest to every one, involving as they do the proper construction of building, and the all-essential, the sanitary features and problems in connection with the erection of homes for loved ones, and abiding places for those who dwell in rented houses.

Mechanics who *fail* to subscribe certainly deprive themselves of a source of information which others of their class have found to be worth ten times its cost in the practical instruction received from its columns.

Besides all of which, we submit the question, whether the enterprise displayed in working up and perfecting a journal of its present high standing does not merit and deserve a large and liberal support from the people of the Pacific States? Then let all who can, SUBSCRIBE; and that none may have reasonable excuse, we will furnish this journal free of charge to all those who are *really unable* to pay $2 per annum, and will so state and verify their case to us.

Novel Insurance Case.

A novel case in insurance law is reported in the *Fireman's Journal*. It seems that the owner of a certain building applied for insurance upon it, and received two policies of twenty-five hundred dollars each. As it turned out, at or about the time of the delivery of the policies the property intended to be insured was actually on fire, and the question arose whether the insurance companies were liable for the loss. According to the authority quoted in the *Journal*, the decision must turn upon the precise time of the beginning of the fire, which a jury would have to determine according to the evidence. If the contract of insurance was consummated, or, as the lawyers say, "the minds of the parties had met," before the breaking out of the fire, the companies would be liable, even if the policies had not been delivered; but if at that moment the fire had actually begun, then there was no liability, for the reason that the subject-matter of the contract of insurance—the house—was no longer in the condition in which it was assumed to be, and which formed the basis of the contract, since no one would knowingly insure a burning building. On the other hand, the same authority remarks that if a policy of insurance should expire during the progress of a conflagration in the building covered by it, the company issuing the policy would be held for the whole loss, even though the fire might have just commenced at the hour which terminated the policy, and the main part of the destruction might have occurred subsequently.

American Institute of Architects.

It is announced that the next convention of the American Institute of Architects will meet on the 25th of next October, at the Gibson House in Cincinnati. Special arrangements have been made for the accommodation of members and others present, and it is urged that the various Chapters of the Institute make their representation as large as possible, on the ground that Cincinnati is a city specially interesting to the profession.

San Francisco Chapter of Architects.

The regular monthly meeting of the Chapter was held on the 4th inst., with a goodly number of members present; President John Wright presiding. After roll-call and the reading of minutes, the following report of special committee was read and unanimously adopted:

To the Officers and Members of San Francisco Chapter of Architects.

Your committee to whom was referred the address of the Brotherhood of Carpenters and Joiners of America, respectfully report that we have carefully reviewed and considered the statements and requests set forth in said address; and while the grievances therein contained appeal to us as architects individually, and should receive our personal and professional influence in the correction and abatement of the unwise and injurious practice alluded to, and made the subject-matter of said address; and while we heartily sympathize with the better classes of mechanics, whose interests and advantages in life's great work are more or less compromised or injuriously affected by irregular and harmful methods and customs, particularly those of the character complained of, which during seasons of comparative or absolute dullness assume large proportions—we are of the opinion that any action or expression by San Francisco Chapter, either directly or constructively not in accord with the objects and purposes of this association, as set forth in Secs. 1 and 2, Art. 2, of the organic laws of the Chapter, would be of questionable propriety, as it would establish a precedent by which all classes of building operatives, conceiving hardships upon them, would feel warranted in appealing to the Chapter upon all disputed questions and issues, and asking and expecting more than might consistently be within the power of the Chapter to afford or effect.

At the same time, your committee hold that wherein this Chapter in its affiliate relationship, and its members individually, may be able to exert an influence calculated to encourage and increase greater mechanical skill and proficiency among house-building artisans, without injustice to any other legitimate and proper interest, it is their duty to do so; and as expressive of the sense of this Chapter, we offer the following resolutions:

Resolved, That we as a Chapter, and as practicing architects, look with disfavor upon and condemn, and in our individual capacities will forbid, the practice of parties letting any part or portion of work contracted for, and under our control, respectively, by the rule or system known as *piece work*.

Resolved, That we as practicing architects, and as members of San Francisco Chapter, realize the wisdom and necessity of extending every possible encouragement and protection in our power, to elevate, ennoble, and improve the opportunities of those whose efforts are in the direction of greater perfection in mechanical operations, and who by legitimate efforts may by striving to correct abuses and develop systems and practices calculated to increase mechanical proficiencies, and inspire higher ambitions among those whose intellectual and physical energies are devoted to the development of the finer and more perfect in the mechanical arts and sciences.

Respectfully submitted,

JAMES E. WOLFE,
H. D. MITCHELL,
GEO. H. SANDERS.

A communication of similar import to the foregoing was received from a committee representing the METAL ROOFERS' AND SHEET-IRON CORNICE MAKERS' UNION of San Francisco, the subject-matter of which, that of "piece" or "job" work, was freely discussed, resulting in the reiteration of the sentiments expressed in the foregoing report, and the expression of decided opposition on the part of any member present to the "piece-work" system under any circumstances. We are authorized in saying that, while the Chapter in its associated capacity can present no practical relief or remedy beyond an expression of opinion, its members individually pledge themselves to use their professional influence in abatement of the evil referred to.

By unanimous vote it was ordered that the newly adopted Constitution and By-Laws of the Chapter be inserted in the CALIFORNIA ARCHITECT AND BUILDING NEWS. It will be found in this issue.

The committees on application for membership reporting favorably upon W. H. Kirk as an associate and Charles V. Pierce as draughtsman members, they were each duly elected.

Members of the Chapter and applicants for membership are requested to bear in mind Sec. 5 of Art. 6 of the By-Laws, which requires that the initiation fee MUST accompany all applications for membership.

As the Constitution and By-Laws of the Chapter fixes September as the time for its annual session and the election of officers, a nominating committee of three was appointed, consisting of Messrs. Wolfe, Laver, and Gash, to report at an adjourned meeting to be held on the evening of August 18th.

The facts and conditions impregnating and surrounding the present organization being such as to dispel all doubt as to the success and permanency of the Chapter, many prominent members of the profession, who have thus far remained disinterested, have signified their intention to affiliate, and assist by their presence and influence in making the Chapter equal to the most successful in the land.

Pacific Coast Press Association.

We have not space to spare for an extended notice of the fourth annual session of the Press Association of this coast, and the splendid concomitants which render the occasion one in many of its features never to be forgotten by those who were present.

The special legislative business of the association, and the election of officers were promptly disposed of, resulting as follows: President, Wm. H. Barns, *Weekly Call*, San Francisco; 1st Vice-President, D. McPherson, *Sentinel*, Santa Cruz; 2nd Vice-President, Ed. Hoole, *Enterprise*, Chico; Secretary, E. A. Weed, *Mission Journal*, San Francisco; Corresponding Secretary and Historian, L. P. McCarty, *Statistician*, San Francisco; Treasurer, F. K. Krauth, *Encinal*, Alameda Co.; Ex. Committee. W. Saunders, *Democrat*, Woodland; Frank M. Dallum, *Journal*, Haywards; and W. H. Fenton, *Argus*, Auburn.

Reaching Pacific Grove Retreat on the evening of July 18th, we found hundreds of ladies and gentlemen assembled at the entrance, to witness the arrival of the press representatives; while the boys gathered on the roadway in front, and shouted "Hurrah! hurrah!" as each coach in turn drove up to the platform. The time spent at the grove and the evening entertainments were of the most pleasing and satisfactory character, except that the restaurant accommodations might be considerably improved by lessening *quantities* and improving *style* and *quality* of dishes served.

The drives enjoyed by the entire company on the 20th, through miles of pine forest, to Cypress Point, and from thence to Pebble Beach, and again back, through the town of Monterey, to the old Catholic Church, completed in 1794, and which, after the abandonment of Carmel Mission, was dedicated as the parish church; thence to the grove—was pleasant and interesting; the very peculiar, attractive and weirding like appearing Monterey cypress trees being conspicuous among the many objects of interest.

On the 21st, the company five twelve-seated vehicles, were driven to the old Carmel Mission, where two hours were spent in contemplating the ruins of the old church commenced in 1770, by the vererable Franciscan Junipero Serra, who fourteen years later was buried within the walls whose foundations his own hands had helped to lay, and whose grave was recently opened with the intent to remove what remained of the pioneer missionary of Carmel; but the fragments found were so few that they were returned to their original resting place. We were personally assured by the guardian of this sacred spot that none of the remains originally buried within the old church—Carmal,—have been removed, statements recently appearing in the daily journals to the contrary notwithstanding.

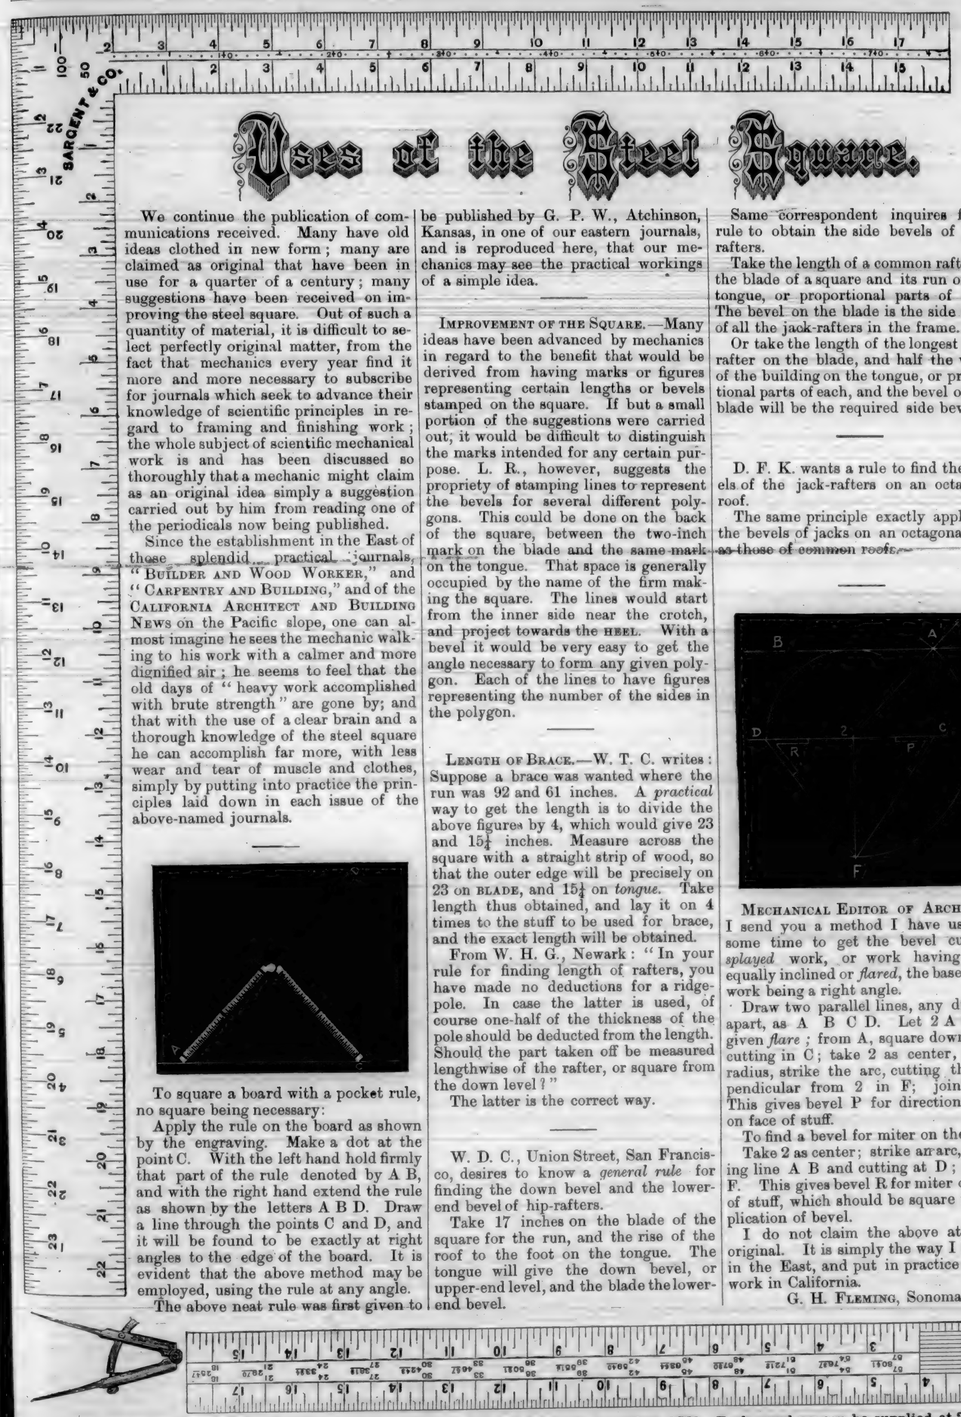
Lunch hour having arrived, the baskets were brought, and a hearty luncheon enjoyed within the walls of the old church; after which the magnificent bathing establishment of the Hotel Del Monte; the hotel itself, with its one hundred and twenty-six acres of trees of natural; and cultivated growth, its miles of splendidly macadamized walks and road-ways, and its innumerable beds of natures beautiful flowers—were all enjoyed to the fullest extent possible under the circumstances.

Two impromptu musical and literary entertainments were managed by Mr. Barns at the grove, to the great delight of the many hundreds of people sojourning at that quiet retreat, where neither tragedy, opera, comedy, minstrels, nor Terpsichorean pleasures are common.

On Saturday morning the company turned faces homeward, some going direct, and others by way of Santa Cruz; but all with the pleasant reflections that the pleasures of the fourth session of the Pacific Coast Press Association ended unmarred by a single regretful incident.

Houses Built of Cotton.

Of all substances apparently the least likely to be used in the construstion of a fire-proof building, cotton would perhaps take the first rank and paper the second; and yet both these materials are actually being employed for the purpose indicated, and their use will probably extend. Compressed paper pulp is successfully used in the manufacture of doors, wall panelings, and for other similar purposes, with the result that all risk of wrapping and cracking is obviated, while increased lightness is attained, and the fear of dry rot is forever banished. Papier-mache, after having served a useful purpose in an obstrusive manner for years as a material for small trays, paper-knives, and other such light articles, has now suddenly assumed a still more important position in the industrial world. A still more striking advance has been made in the employment of cotton as a building material. A preparation called celluloid, in which cotton is a leading ingredient, has been used lately as a substitute for ivory in the manufacture of such artibles as billiard balls and paper-cutters; and now a Canadian manufacturer has invented a process by which compressed cotton may be used not merely for doors and window frames, but for the whole *facade* of large buildings. The enormous and increasing demand for paper for its normal uses as a printing and writing material, prevents the extended use of papier-mache as a building material, for which it is so well suited in so many ways; but the production of cotton is practically unlimited, and there seems to be a large field available for its use in its new capacity as a substitute for bricks—or at least plaster—and wood. Treated with certain chemicals and compressed, it can be made fire-proof, and as hard as stone, absolutely air and damp proof; and a material is thus produced admirably adapted for the lining—internal and external—of buildings of which the shell may or may not be constructed of other material, while it easily lends itself to decorative purposes.



Uses of the Steel Square.

We continue the publication of communications received. Many have old ideas clothed in new form; many are claimed as original that have been in use for a quarter of a century; many suggestions have been received on improving the steel square. Out of such a quantity of material, it is difficult to select perfectly original matter, from the fact that mechanics every year find it more and more necessary to subscribe for journals which seek to advance their knowledge of scientific principles in regard to framing and finishing work; the whole subject of scientific mechanical work is and has been discussed so thoroughly that a mechanic might claim as an original idea simply a suggestion carried out by him from reading one of the periodicals now being published.

Since the establishment in the East of those splendid practical journals, "BUILDER AND WOOD WORKER," and "CARPENTRY AND BUILDING," and of the CALIFORNIA ARCHITECT AND BUILDING NEWS on the Pacific slope, one can almost imagine he sees the mechanic walking to his work with a calmer and more dignified air; he seems to feel that the old days of "heavy work accomplished with brute strength" are gone by; and that with the use of a clear brain and a thorough knowledge of the steel square he can accomplish far more, with less wear and tear of muscle and clothes, simply by putting into practice the principles laid down in each issue of the above-named journals.

To square a board with a pocket rule, no square being necessary:

Apply the rule on the board as shown by the engraving. Make a dot at the point C. With the left hand hold firmly that part of the rule denoted by A B, and with the right hand extend the rule as shown by the letters A B D. Draw a line through the points C and D, and it will be found to be exactly at right angles to the edge of the board. It is evident that the above method may be employed, using the rule at any angle.

The above neat rule was first given to be published by G. P. W., Atchinson, Kansas, in one of our eastern journals, and is reproduced here, that our mechanics may see the practical workings of a simple idea.

IMPROVEMENT OF THE SQUARE.—Many ideas have been advanced by mechanics in regard to the benefit that would be derived from having marks or figures representing certain lengths or bevels stamped on the square. If but a small portion of the suggestions were carried out; it would be difficult to distinguish the marks intended for any certain purpose. L. R., however, suggests the propriety of stamping lines to represent the bevels for several different polygons. This could be done on the back of the square, between the two-inch mark on the blade and the same mark on the tongue. That space is generally occupied by the name of the firm making the square. The lines would start from the inner side near the crotch, and project towards the HEEL. With a bevel it would be very easy to get the angle necessary to form any given polygon. Each of the lines to have figures representing the number of the sides in the polygon.

LENGTH OF BRACE.—W. T. C. writes: Suppose a brace was wanted where the run was 92 and 61 inches. A *practical* way to get the length is to divide the above figures by 4, which would give 23 and 15¼ inches. Measure across the square with a straight strip of wood, so that the outer edge will be precisely on 23 on BLADE, and 15¼ on *tongue*. Take length thus obtained, and lay it on 4 times to the stuff to be used for brace, and the exact length will be obtained.

From W. H. G., Newark: "In your rule for finding length of rafters, you have made no deductions for a ridge-pole. In case the latter is used, of course one-half of the thickness of the pole should be deducted from the length. Should the part taken off be measured lengthwise of the rafter, or square from the down level?"

The latter is the correct way.

W. D. C., Union Street, San Francisco, desires to know a *general rule* for finding the down bevel and the lower-end bevel of hip-rafters.

Take 17 inches on the blade of the square for the run, and the rise of the roof to the foot on the tongue. The tongue will give the down bevel, or upper-end level, and the blade the lower-end bevel.

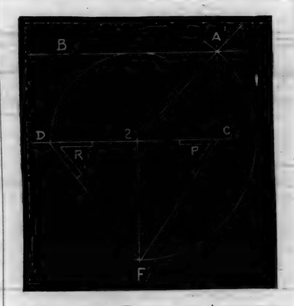
Same correspondent inquires for a rule to obtain the side bevels of jack-rafters.

Take the length of a common rafter on the blade of a square and its run on the tongue, or proportional parts of each. The bevel on the blade is the side bevel of all the jack-rafters in the frame.

Or take the length of the longest jack-rafter on the blade, and half the width of the building on the tongue, or proportional parts of each, and the bevel on the blade will be the required side bevel.

D. F. K. wants a rule to find the bevels of the jack-rafters on an octagonal roof.

The same principle exactly applies to the bevels of jacks on an octagonal roof as those of common roofs.



MECHANICAL EDITOR OF ARCHITECT: I send you a method I have used for some time to get the bevel cuts for *splayed* work, or work having sides equally inclined or *flared*, the base of the work being a right angle.

Draw two parallel lines, any distance apart, as A B C D. Let 2 A be the given *flare*; from A, square down a line cutting in C; take 2 as center, and A radius, strike the arc, cutting the perpendicular from 2 in F; join C F. This gives bevel P for direction of cut on face of stuff.

To find a bevel for miter on the edge: Take 2 as center; strike an arc, touching line A B and cutting at D; join D F. This gives bevel R for miter on edge of stuff, which should be square for application of bevel.

I do not claim the above at all as original. It is simply the way I learned in the East, and put in practice on my work in California.

G. H. FLEMING, Sonoma Co.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

Dwelling-House Sanitation.—II.

BY GLENN BROWN.

"Pure air, pure water, and a pure soil."—HIPPOCRATES.

Furnaces, if we except stoves, are the form of heating apparatus most generally used in this country, and from their cheapness in first cost, and from the small amount of labor required to keep them in order, there does not seem to be anything now in the market that will compete with them in the above respects. With care, they may serve their purpose well, but they must be carefully selected, arranged, and properly cared for.

Furnaces are found in the market manufactured of wrought and cast iron and soapstone. In selecting the kind of furnace to be used, one should get it with a large heating surface, so that it may heat the air sufficiently without becoming red-hot, else the air will be heated to an injurious degree, and the gases of combustion will be allowed to escape through the pores of the cast-iron into the fresh-air supply, and then through the lungs into our system. Dr. John S. Billings, U. S. A., says: "The lassitude and headaches caused by furnace heat does not arise, as most people suppose, from the air being over-heated or too dry; but from the carbonic oxide, one of the products of combustion, which gets into the fresh-air supply through the joints or cracks." Although wrought iron may not transmit gas at a red heat, the joints are more liable to get out of order, as it contracts and expands in a greater degree than cast-iron, when acted upon by cold and heat. The heating surfaces of both cast and wrought iron furnaces may decompose the air itself, when they become red-hot, forming acid gases with the iron, which are injurious to the health. Wrought iron fails from oxidation much sooner than cast-iron; so cast iron, provided it has as large a heating surface, will be found better than either soapstone or wrought iron for furnaces. Be careful to select a furnace with as few joints as possible; they are always weak places through which the gas may escape. The inlet for the fresh air, which is to be heated and distributed through the house, should have the greatest care taken in its location. It should commence at least seven or eight feet above the ground, and it must not be placed so that the foul air from the stables or the back yard will be drawn directly into it, and carried into our living rooms. Extreme care should, moreover, be taken, that the source from which the air comes is pure; also, lest parties putting in the furnace should carry the cold air over a sewer (no sewer drain should be allowed under the cellar floor, but they will be often found in this position). The cold-air duct should be above the cellar floor, and lined with metal, tin being one of the most suitable metals for this purpose; made in this way, it is not possible for the gases from the ground or drains to enter the fresh-air duct. The fresh air should never be taken directly from the cellar, for in that case we would have our air—and be it remembered this is the air which we are to breathe in our rooms—vitiated by the exhalations which rise from the ground, by any gas which may escape from the sewer drains, and by any decayed vegetable matter that may be in the cellar. There is a class of stoves called latrobes (fireplace furnaces they would be more properly called), which are extensively used in Washington, Baltimore, and vicinity, and as far as our knowledge extends, they invariably take the air to be heated directly from the cellars. These same cellars are often made the receptacle for all the refuse of the house, and are damp, having water and decayed matter in them. This state of things is dangerous; the air supply should be brought from a purer source. The water pan, or evaporator, of furnaces must be properly filled with water, so the air supplied will not be disagreeably dry. Unless this is looked after by the head of the house, it is apt to be kept full of rubbish instead of water.

Hot water and steam heat are both excellent modes of heating when properly arranged, and proper allowance is made for the supply of pure fresh air. Both kinds of apparatus have their advantages. They may take the place of a furnace. Pure air which is brought in from the outside is heated by the steam or hot water coils, and then distributed by pipes to different parts of the building. In this case as much care should be taken that the air which is to be heated is pure, and that the source from which it comes is clean, as in the case of a furnace. This way of using steam or hot water for heating may be considered the best, as by it pure air is easily obtained; and it has this advantage over the furnace: there is no danger of the fresh air being contaminated by the gases which may get into the hot-air chamber of the furnace during combustion, by either overheating, or through the joints and cracks. A building may also be heated with steam or hot water, by either of them being distributed through pipes to different parts of the house, and then giving off their heat through radiators. In a room heated by radiators the vitiated air is breathed over and over again, unless there is an inlet made for fresh air back of each radiator, so the air may be partially warmed, so that no one will be chilled by it when it enters the room. Of course a small amount of pure air comes in constantly through the crevices around the windows and doors, and even through the wall itself; but this is not in a sufficient quantity. Looking at the hot water or the steam-heating apparatus from the point of safety, any one will readily see that there is much less danger of fire than with a furnace or stove, so it is necessary to take fewer precautions. Steam and hot water pipes are not liable to set wood-work on fire, although there are cases on record where it seemed probable that steam pipes caused the wood with which it came in contact to be charred. Furnace flues improperly set or arranged, have been and probably will continue to be the means of destroying an untold amount of property.

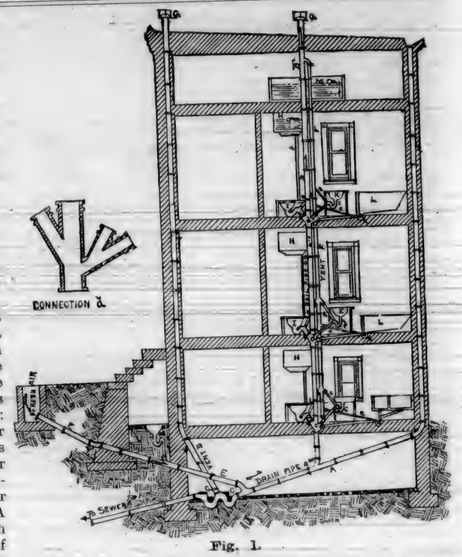


Fig. 1.

Mr. Charles Hood says, in regard to steam and hot-water apparatus: "The first cost incurred for the erection of the two kinds of apparatus will differ but little when the work is done in an equally substantial manner; but the wear and tear and repairs of a hot-water apparatus will be less than of a steam apparatus." Hot water also has the advantage over steam, in a heating apparatus, of being less liable to explosion, or to set wood-work on fire; although steam is not dangerous in either respect when properly managed. It is claimed for steam heat that it is more easily managed, that is, we may have a large or a small amount of heat more readily than with hot water.

Heating by an open fireplace is really the most conducive to health, provided it has enough power to heat the room comfortably. The only difficulty with the open fireplace is that it is not economical, so much heat is lost by being carried up the chimney. Its advantages are, that it takes off the vitiated air, and causes the pure air to find its way through the crevices, or some inlet made specially for it, and adds to our cheerfulness. It is impossible in our cold, winter weather, north of the Potomac River, to keep our rooms comfortable by open fires alone; so we have to combine this mode of heating with a furnace, steam, or hot-water apparatus. We consider the best mode of heating to be an open fireplace, combined with a hot-water or a steam-heating apparatus. The manner of working in this case is this: the fresh air is taken from a pure source, heated by the steam or hot-water coils, carried through proper ducts into the rooms of our house, warm and pure. The open fireplace furnishes us with heat by direct radiation, thus giving us an opportunity of warming rapidly any portion of the body which may be cold. It also carries off the vitiated air which is produced by the breath or combustion. In this manner, by proper care, a sufficient amount of pure air is obtainable, and the bad or impure is withdrawn. Mr. J. P. Putnam of Boston, in his articles on the open fireplace, mentions a fireplace that he is putting in his own house, which may possess the advantages of a combination of the fireplace and the hot-water apparatus. This is an open fireplace that utilizes the heat, which goes up the chimney in smoke, in warming the fresh air brought in from the outside, the pure air is then introduced into the rooms through registers placed over the mantel. In this case, as in the common, open fireplace, the vitiated air goes out through the chimney. From Mr. Putnam's account, this would appear to be a practical mode of utilizing the heat that would be otherwise lost with the open fireplace.

There have been numerous patents and patterns to effect the same purpose, and there really seems to be no reason why some of them have not been brought into a more extended use.

As a matter of course, it is only the wealthy who can afford this double mode of heating mentioned above; and in writing of the different modes of heating, we have endeavored to explain the difficulties in each class, and how these difficulties may be best avoided.

Let us next take for consideration the important portion of the sanitary arrangements of a house which appertains to plumbing. It is generally, through the water-closets and wash-basins, from the sewers or the drains that the greatest harm comes to the members of the household.

The proper materials to be used inside the house for drain and soil pipes is cast-iron with lead joints. No drain tiles (terra-cotta pipes) should be used inside a building, because of their liability to have been cracked or imperfectedly formed when put in, or else to crack after being placed in position, as well as their further liability to break by the settling of the foundation. All tiles must be covered to protect them from breakage; imperfect tiles are very easily employed by careless workmen, because when hidden from sight by the earth covering, their imperfections are not observable. Through the smallest crack or crevice sewer-gas will find its way into the ground, from the ground into the cellar, from the cellar through the floors into the interior of the house. In this connection we must recollect that all baneful gases do not come from the street sewer, but from the drain and soil pipes inside the house itself; so that even if the gas were shut off from the sewer by a trap (see figure 1 C), the gas generated inside the house drains would come through any crack. In all old houses in which the best plumbing was done, lead soil pipes were used, and lead pipes are still advocated by the English authorities. But there have been a great many objections to the use of lead discovered which show that it never ought to be employed as drain or soil pipes, or as traps. Rats will eat holes in it, and where the joints are soldered galvanic action occurs, and holes are also this way produced in it. It is supposed that sewer gas itself acts on lead injuriously, causing it to be perforated by small holes. From any of the above-mentioned causes a house may be filled with sewer-gas, the occupants being unaware of its presence until they are stricken down with disease. Lead pipes, not having the stiffness of iron, when run nearly horizontal, sag from their own weight, thus forming a trap where water would stand constantly, and interfere with the proper ventilation of the plumbing system.

Iron drains have only the disadvantage of rusting readily. This is overcome by dipping the pipes in gas-tar. Iron pipes prepared in this way, with enameled iron or porcelain traps, form the best materials of which to make drain and soil pipes with their connections. There are iron enameled soil pipes manufactured, which are excellent, but quite costly. For supply pipes most authorities still name lead as the best material, but on account of the ease with which ingredients of certain kinds of water act upon it, it is doubtful whether tin-lined lead pipes or iron pipes porcelain-lined would not be preferable.

(To be continued.)

Talks About Tools.

However irksome the task may be, the proper sharpening of tools is worthy of the most careful study of those who would attain proficiency in their use. Some may suppose that sharpening a tool is one of the easiest things imaginable, and that to speak of making it a study is to employ far too dignified a word; but such is hardly likely to be the view of any but of the inexperienced. The tools to be seen on far too many carvers' benches bear witness to the fact that proper sharpening is not easy, or if it is, that their owners have yet to acquire the art. If the only object be to obtain an edge, without regard to the shape of it or the manner in which it is obtained, the simplicity of sharpening may be granted. But it has already been shown in these "Talks" that there is a close connection between the "handiness" or usefulness of a tool and the mode in which it has been sharpened. And a little reflection will discover to the most inexperienced learner that edged tools generally, besides carvers' tools in particular, are sharpened or brought to an edge in various ways and in accordance with the purpose for which they are required. The mortice and paring chisel of the maker, for example, though flat tools, are brought to an edge from one side only. The carvers' firmer is brought to an edge from both sides. The mortise chisel is brought to an edge at a different angle with the stone from the paring chisel, not only that the edge may be thicker, but that it may work in a certain direction—a direction corresponding with that of the mortice. Again, the maker's chisels, whether mortise or paring, are sharpened quite flat; whereas the carvers' firmer, excepting, perhaps, the smallest sizes, presents when properly sharpened an edge slightly rounded. Yet each of these tools is flat. And that there are edges *and* edges may be illustrated by a reference to the familiar pocket-knife which its youthful owner has essayed to sharpen a dozen or twenty times, only to find its capacity for mischief effectually, and to him disagreeably, reduced. It is plain, therefore, that it is necessary not only to have an edge, but to have one of the right sort. In saying this much there is not the slightest desire to dishearten the learner, but merely to vindicate, if such be thought necessary, the proposition contained in the opening sentence of this paper. It would be unreasonable to suppose that the principles indicated in what has just been said could be apprehended without reflection; and there can be no intelligent sharpening until they have been apprehended.

In addition to this, only attention and practice will enable the learner to overcome what may be termed the mechanical difficulty of sharpening—to obtain that command of the wrist which shall insure the scroll tool or voluter being brought to an edge from one end to the other, at one angle only, and without rubbing away more from one part than another. Inattention to these points is frequently the cause of the bad working of a tool. The close connection between good tools and good work has often been pointed out; and so long as this is the case, so long will the proper sharpening of tools be worthy of careful study. The irksomeness of sharpening may be granted, and we shall hope to point out the way in which the best result may be obtained with the least possible expenditure of time and trouble.

In the first place, a good stone is most important. A good stone cuts fast without being cut fast, and presents a surface unimpaired by shakes or holes caused by brittleness. Some twenty years ago the carver's choice of stones was almost entirely limited to "Charnley Forest" and "Turkey"—good specimens of the latter fetching high prices; but as in tools so in stones, our American cousins have widened the limits within which our choice may be exercised, and now we have "Niagara," "Washita," "Arkansas," the latter of which is excellent, though the others are not to be depreciated. The stone when bought is flat: *keep it so.* It is the practice of some carvers to sharpen scroll tools and voluters by rubbing on the stone with a motion backward and forward as in sharpening flat tools, and the stone is seen with a series of hollows of various sizes running lengthwise. But the practice of carvers generally, and experience may be said to support the practice, is to sharpen all but flat tools with a motion which, beginning at one end of the edge, ends at the other, and so on. It is, of course, for this latter mode of sharpening that the flat stone is recommended, and for this mode of sharpening that it is desirable to *keep* it flat. Reference has already been made to the importance of the tool being brought to an edge from one end to the other at *one angle only.* But sharpening in the way recommended on a *hollow* stone this result is almost impossible. To keep a stone flat, even without rubbing it down, is not particularly difficult if the stone is a good one, and a good "sweep" is taken in sharpening the tool. A short, jerky motion must be avoided if the tool is to be free from ridges at the edge. Beginning at one end of the edge of an ordinary scroll tool, the other end should not be reached until the length of a good-sized stone has been covered. A stone for a firmer should be slightly hollow that the edge may be slightly round, but if a stone is too hollow for a firmer it is too hollow, for a scroll tool, and should be rubbed down. Good slips are no less important than a good, flat stone. How greatly the insides of tools are neglected? Some tools are to be seen sharpened almost entirely from the back, whereas they should be sharpened almost, if not quite, as much from the inside. And this can be done with as little trouble by the simple expedient of fixing the slip so that both hands are available for pressure on the tool.—*Cabinet Maker (Eng.).*

Hints on Painting Old Wood-work.

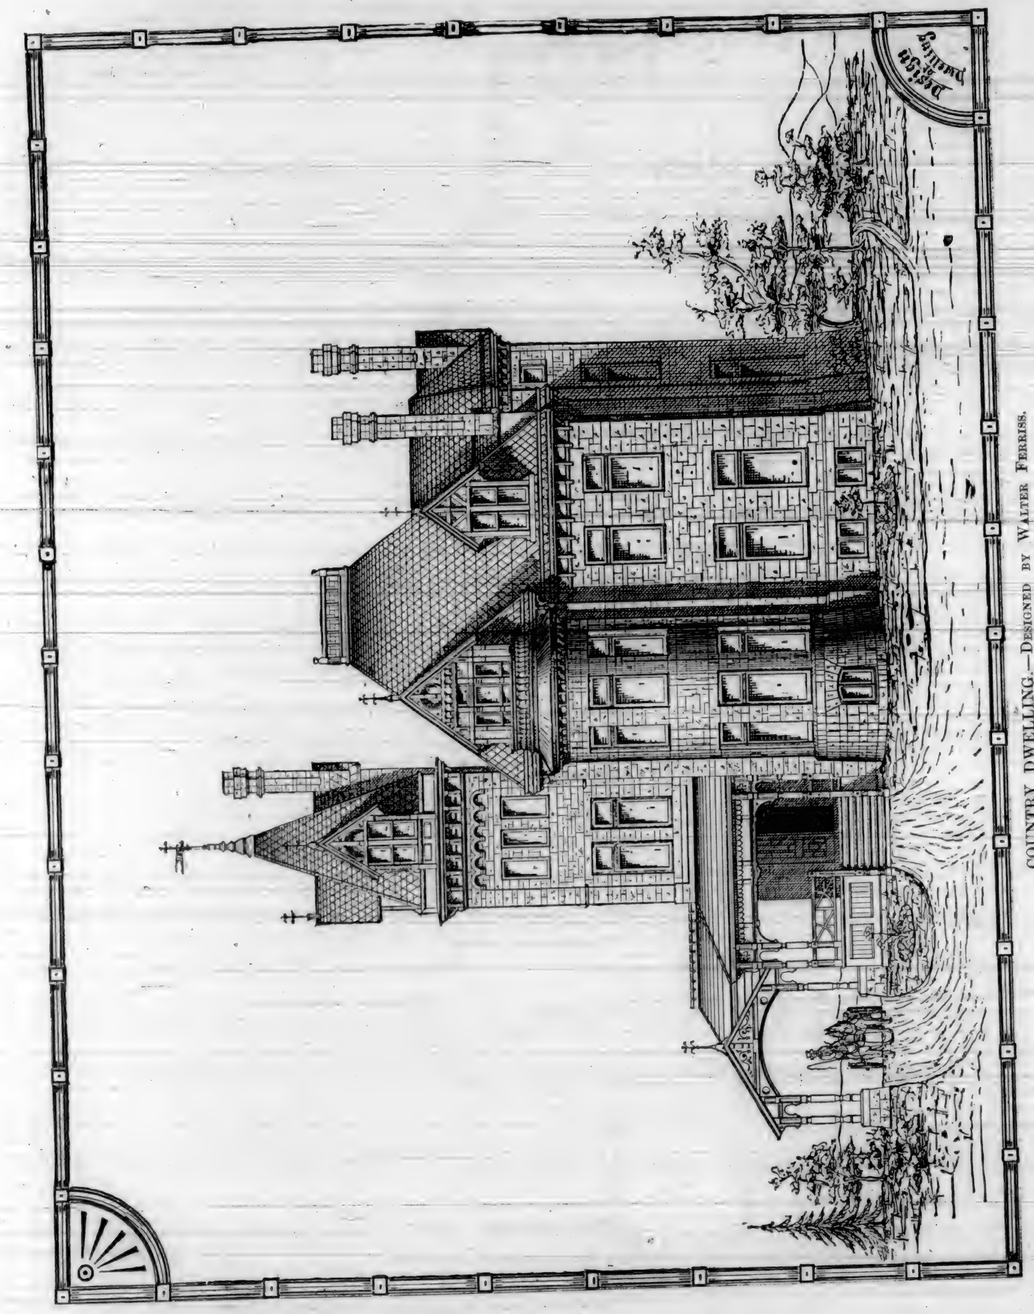
As soon as there have been one or two hard frosts to kill most of the flies, it will be an excellent time to paint wood-work in the kitchen, or any other part of the house. Saying nothing of the economy of painting, it is an excellent practice to apply a thin coat of paint to all the wood-work of the kitchen once in two or three years. Good paint always saves much hard labor in keeping such parts of a house clean. Some doors that are used often need painting every year to keep them at all decent. It is not best to put on thick, heavy coats, as these are needlessly expensive, and after a few years will look bad. The same amount of paints, applied often in thin coats, will look better and cost little more.

Where wood-work is much soiled, especially by hands not scrupulously clean, it is sometimes difficult to make even the best of paint hold well. It will dry soon enough, but will afterwards peel off, for paint will not adhere well to a dirty, greasy surface. This is particularly the case in rooms where washing and cooking are usually carried on.

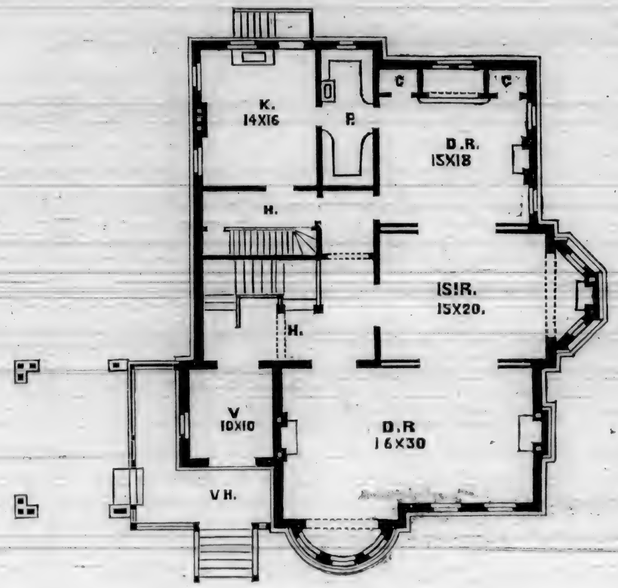
In order to make paint stick and become about as firm as the wood itself, wash the surface thoroughly with moderately strong lye, using a short swab, then wipe it off with a cloth wrung out in fresh water. This will remove all grease and dirt that prevent the paint from taking a firm hold.

Paint for such places should be made of the best white lead, mixed to the consistence of thin cream, with two parts of the best boiled linseed oil, and one part of good lacquer, or "liquid drier." Such paint will dry in one day and become sufficiently hard to handle in a few days. A very small quantity of lamp-black will make a beautiful lead-color. Yellow ocher may be added until the paint is of the desired shade for floors, mop-boards, or wainscoting. Pure white-lead for the body will make a much more durable paint for floors than most other kinds. The use of zinc-white, which is much superior to white-lead in some situations, as, for instance, in privies, is attended by a little difficulty, because it must be applied very thick, to cover well when used alone; but a second coat, not so thick, may be put on over other paint, and it will add greater brilliancy and will not tarnish from sulphurous gases frequently rising from sink-drains, etc., nor from the exclusion of light, which causes white-lead paint to turn yellow.—*Ex.*

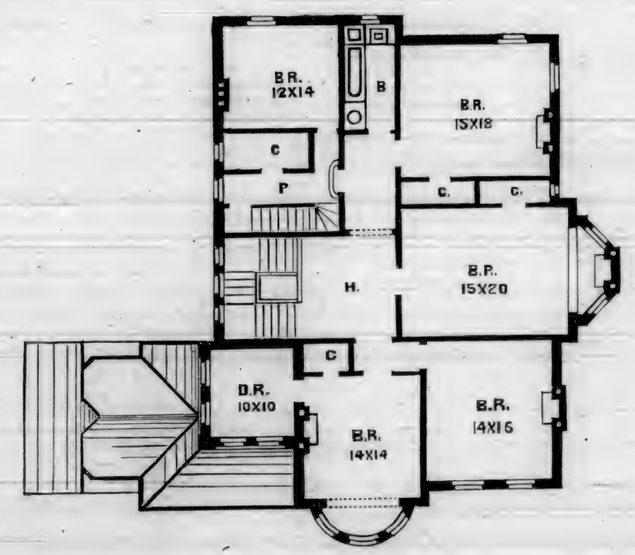
PRACTICAL LESSONS
—IN—
ARCHITECTURAL DRAWING,
PRICE, POST-PAID, $2.50.



COUNTRY DWELLING.—DESIGNED BY WALTER FERRISS.



FIRST FLOOR PLAN, COUNTRY DWELLING.



SECOND FLOOR PLAN, COUNTRY DWELLING.

Practical Lessons on the Science of Carpentry.

A work that every mechanic should have. It is designed to make the science and art of carpentry clear and comparatively easy to all who require information on the subject. This book is also of use to all who have barns, bridges, and outhouses to build, and require information how to accomplish the work. Sent post-paid to any address, upon receipt of $5.00.

Modern House Painting.

This is the first book which we have seen in which an author attempts to show by colored lithographic plates the effect that different colored paints will have upon the appearance of a house. Many who want to do what will be considered in good taste are puzzled to know what colors to use, and how to direct their painter so as to give him a tolerable clear idea of what they want. It is believed that there is a demand for a book of this kind, and that even if the results set forth by the plates may not be exactly what each individual reader would choose, it will be of benefit to both the painter and the house owner as a partial guide.

EVERY ARCHITECT SHOULD POSSESS A COPY.

Sent post-paid to any address, on receipt of the publisher's price, $5.00.

Practical Lessons in Architectural Drawing.

The scheme adopted in this work is to select more or less simple examples in the several classes of construction—frame, brick, and stone—and by carefully working out the drawings in the order in which they are required in actual building, and by explanations in the adjoining text, to put the work in such shape that it can be readily understood and comprehended. The examples have been given a varied character, in order that as many different ideas as possible may be illustrated. The last chapter deals with the coloring of architectural working drawings, and is illustrated by a plate in colors. Sent post-paid to any address, upon receipt of the publisher's price, $2.50.

Work Manuals.

The following are the titles of the volumes already received:

I. CEMENTS AND GLUES.
II. THE SLIDE RULE, AND HOW TO USE IT.
III. HINTS FOR PAINTERS, DECORATORS, AND PAPER HANGERS.
IV. CONSTRUCTION, USE, AND CARE OF DRAWING INSTRUMENTS.
V. PROBLEMS IN CARPENTRY AND JOINERY SOLVED BY THE AID OF THE STEEL SQUARE.

Upon receipt of twenty-five cents in postage-stamps, we will mail either of the above-named to any address.

American Cottage Homes.

REDUCED TO $3.00. On account of the publishers changing the location of their business, they intend to clean out effectually all their stock on hand. To do this, they have REDUCED THE PRICE OF THEIR COTTAGE HOMES TO $3.00. Will send a copy to any address, upon receipt of the price.

Palliser's Details.

REDUCED TO $2.00 PER SET. The authors are determined to close out their present lot of Details, as they intend to move to New York City. In conformity with orders to take effect after August 1st, 1882, we have reduced the price post-paid to any address, upon receipt of $2.00.

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

[While this column is open to all, farmers as well as mechanics, engineers as well as architects, we would call particular attention to one and all to have their questions and the information desired to be in accord, as far as possible, with the interests of this journal and for the carrying out of those principles for which the only monthly of its kind this side of the continent was established. We will endeavor to answer all questions in a fair and impartial manner, and if it becomes necessary, will furnish cuts for the illustrations of any problem, provided we regard the solution thereof as beneficial to the majority of our readers. We would urge upon our patrons the necessity of being pointed in their questions, concise in the language used; let the writing be distinct, and one side of the paper only to be used; give full name and address, and particularly mention if their proper name shall be used.

We want it distinctly understood that the responsibility of signed articles rests with the authors.

Correspondents will please direct all communications to the business manager of this journal—240 Montgomery street, rooms 12 and 13.]

To render thick paper quite translucent, saturate it (while warm) with Canada balsam or castor oil.

Logs and planks split at the ends because the exposed surface dries faster than the inside. If muriatic acid be saturated with lime and applied to the ends, like whitewash, the chloride of calcuim formed attracts moisture and prevents splitting.

In a new decision by the Missouri Court of Appeals, in the matter of a property owner's petition for injunction against a telegraph company which had put up a pole opposite his premises, under a permit from the Board of Public Improvements, it was stated that the power of the board to give such permits might be so limited as to exclude the erection of anything unsightly.

A recent invention provides a window, the sash of which slides up and down in the usual way, with counterweights passing over pulleys. A portion of the length of the window jambs is a pivoted swinging frame, so that both sashes may be run up into the frame, and swing out horizontally or reversed, as desired. The swinging frames are mounted on hollow pivots provided with cross-pintles and rollers, over which the sash-cords pass. A spring catch in one of the side frames, operated by a lug on a rod, engages a notch in the sashes. The cords have an apertured plate to prevent twisting. The swinging frames are grooved to receive the sashes.

To sharpen worn-out files, first clean them very carefully with a little warm potash water and a stiff brush; wash and rinse in warm water, and wipe perfectly dry. Then dip them an instant in nitric acid, and wipe off the acid carefully with a rag wound on the end of a stick. It is impossible to wipe off the acid between the teeth, however, and this remains, corroding and sinking into the metal until the teeth are as long and sharp as when first made. Wash in warm water with a brush, two hours after completing the operation. If not yet satisfied with the result, repeat the whole operation.

Dr. Siemens proposes to defend the Channel Tunnel, if constructed, from hostile invasion, by placing the shore ends in communication with chambers filled with lumps of chalk, and to connect each of them by means of a pipe with a large cistern filled with dilute muriatic acid. Upon opening the communication this acid would flow into the upper portion of one of the chambers, and be distributed by perforated pipes over the chalk, giving rise to a rapid generation of carbonic acid gas, which would for half a mile or more form an insuperable barrier to the passage of human beings through the tunnel.

Plaster casts have the defect of being very soft, brittle and not water proof, so that they can not stand any wearing contract, nor rain; they may, however, be improved in this respect, as well as in their appearance, by a dip in an emulsion of one quart warm rain water, one ounce of white soap, and one ounce of white beeswax, well incorporated together. After dipping the cast is placed in a dust-free place to dry, and rubbed afterward with a soft rag until smooth. Another method is to dip the plaster cast in an alum solution, and treat as above, or to mix a little plaster with a strong alum solution, and when set, bake it in an oven, then grind it fine, mix with water, and spread it with a brush over the plaster cast. It sets quick, and takes a high polish by rubbing; if one coat is not enough, a second can be given.

Gone to Their Long Home.

Two English architects of distinction have within a few days followed their associates, Street and Scott, to their eternal rest. Joseph Aloysius Hansom, the elder of the two, had completed, in his eightieth year, a life full of success and happiness. Beginning his career as an apprentice to his father, a joiner, when only thirteen years old, his general capacity and taste for design led to his transfer to the office of an architect of ability, under whom he acquired a knowledge not only of his new profession, but of many other matters in which his active mind interested itself. He married early in life, and soon afterward entered into busines on his own account, winning almost at the outset, the important competition for the Birmingham Town Hall. Although the Town Hall Commissioners took the usual advantage of his youth and inexperience, and drove him into bankruptcy before the work was completed, he gained a reputation, and was thenceforth never without employment. In the first few years of poverty, after his misadventure with the Birmingham Commissioners, he was induced to undertake work not strictly within the scope of his profession, and at the suggestion of friends perfected and patented what he called a "Safety Cab," which was subsequently introduced in London, and has made his name a household word wherever the English language is spoken. In 1842, the idea of founding an illustrated journal for the service of the building trades and professions occurred to him, and on the 31st day of December in that year he issued the first number of the *Builder*. He had not, however, sufficient capital to carry on this enterprise, and soon transferred it to other parties, to devote himself thenceforth wholly to his profession. Much of his work was ecclesiastical, and being himself a devout Catholic, a large part of the modern Romanist churches in England were designed by him or his son, who was for many years his partner. The beautiful church of St. Philip Neri an Arundel is probably familiar to our readers from the drawings published in the English professional journals, and the Convent of Our Lady at Plymouth is in some respects even more admirable. Besides these, the *Builder* enumerates fifty-five other churches executed from his designs, with many secular or semi-ecclesiastical structures.

A day or two after Mr. Hansom's decease died Mr. George Somers Clarke, also an ecclesiastical architect of great ability. His designs were generally in that massive style first introduced, we believe, by Mr. James Brooks, but were at the same time thoroughly well studied and graceful in a dignified and simple way. In matters relating to his profession he was unusually intelligent and well informed, and few of the younger architects gave promise of greater distinction. With the next English mail we shall undoubtedly receive further details of his career, which although so short has brought him honor enough to satisfy a moderate ambition, and will try to select some of the most interesting particulars for the benefit of the younger readers.—*American Architect.*

Chimney and Smoke Flues.

Why is it that about seventy-five per cent. of all the fires that occur in dwellings, and very many other buildings, have their origin in defective flues? Now a little care upon the part of the builder would prevent this. No flue should be less than 8x8, or the length of one brick square in the clear, and this size should be maintained from bottom to top, regularly built, not contracted at some points and expanded at others. The walls adjacent to the flue should be laid close, and every joint of the bricks be slushed or entirely filled with mortar. The inside of the flue should be well pargeted with mortar that will adhere to the bricks; simple lime and sand mortar will not be effectual, although used in common, if not almost universally. When the flue becomes heated, which it will at times, common mortal will peel off and leave the joint exposed for the admission of smoke and fire, and at points where the wood, such as flooring and timbers supporting the same, approaches too near the brick work of the flue, will ignite, and the fire will extend between the ceiling floor along the joist, and will have control of the building before it is visible to outsiders or inmates of the house, and the building is either seriously damaged or entirely destroyed for the want of a little care and attention in the construction of the flue. Pargeting mortar should have a portion of cow's hair about the same proportion that is usually put into lime intended for the first coating of plastering mortar—put upon lath-work or ceilings, or, what is equally as effectual, horse manure in the same proportion thoroughly mixed in the lime and sand mortar. As a further safeguard at the intersection of floor with chimney flues, there should be at least eight inches between the inside of the flue and the wood-work of said floor; or, what would answer the same purpose, insert clay pipe, corresponding in size to the flue from a point at least one foot below the floor timbers to a point one foot above top of said flooring. If the pipe cannot be procured in single length, thereby requiring piecing, the joints should be connected with rebating joints. I have named 8x8 inches above as a minimum, the proper size for stove flues; but for fireplaces, grates, etc., they should be, if possible, 8x12 inches, or one brick by one and a half Bricks in the clear, and for furnaces, 12x12 inches, or one and a half bricks square in the clear. By having the flues large they will be more certain of good draught.

It cannot be said that we have improved our method of flue building over that used a generation or so back, that is, so far as safety from fire is concerned. Care was taken then to construct the flues sufficiently large to admit the passage of a boy or "sweep," who cleaned them out; and those neglecting to keep their chimneys clean were subject to a fine. Many of us will recall the quaint procession of chimney-sweeps which used to be a familiar street scene. Usually it was headed by an old negro as "boss," and included six or eight little darkies, ranging in age from fifteen down to a little four-year old. In some cases, even the smallest sweep had difficulty in making his way up the flue, and I recollect where a little chap got caught half-way up, and called down in plaintive tones that he could go no farther. The owner of the apartment was at a loss to know what to do, but a happy thought struck him, when he called up the chimney, hinting to the imprisoned sweep that he was about to kindle a fire. In a few minutes the little darkey was singing out, "Sweep ho!" on the roof.—*Builder and Wood-worker.*

CONSTITUTION AND BY-LAWS

OF

SAN FRANCISCO CHAPTER

OF THE

American Institute of Architects.

FOUNDED MAY, A. D. 1881, AS THE PACIFIC COAST ASSOCIATION OF ARCHITECTS, AND RE-ORGANIZED AS SAN FRANCISCO CHAPTER, MAY, 1882.

CONSTITUTION.

ARTICLE I.

NAME.

SEC. 1. The name of this Society shall be *San Francisco Chapter of the American Institute of Architects.*

ARTICLE II.

OBJECTS.

SEC. 1. Its objects shall be to unite in fellowship the architects of the Pacific Coast; to encourage, promote, and sustain professional standing, dignity, and harmony; to stimulate friendly intercourse, and to combine in efforts for the promotion of the artistic, scientific, and practical proficiencies in the profession.

SEC. 2. The means of accomplishing this end shall be: regular monthly meetings of the members for the introduction and discussion of subjects of professional and general interest and importance; the reading of essays; lectures upon topics of special, technical, and general chararcter; the establishment of schools, or the adoption of other practical measures for the better education and qualification of architects, and the diffusion of more thorough and perfect knowledge in the correct and more advanced theories, principles, and practice of the science of architecture; exhibition of architectural drawings; the formation of a library; the collection of designs, models, and specimens of building materials; and such other means and measures as shall be best calculated to promote the objects of the Chapter.

ARTICLE III.

MEETINGS.

SEC. 1. The Chapter shall meet in annual session in September of each year; and monthly, as provided in the By-Laws.

ARTICLE IV.

OFFICERS.

SEC. 1. The officers of the Chapter shall be a President, Vice-President, a Recording and a Corresponding Secretary, and Treasurer.

SEC. 2. No one shall be eligible to the office of President, unless he shall be a Fellow in good standing in the "American Institute of Architects."

ARTICLE V.

MEMBERSHIP.

SEC. 1. The membership shall consist of: first, Fellows; second, Associates; third, Draughtsmen; fourth, Articled Students; fifth, Corresponding Members; sixth, Honorary Members; seventh, Life Members.

SEC. 2. The qualifications to *Fellow* membership shall be the regular practice of the profession within the State of California, or States or Territories adjacent thereto, as contemplated by the Constitution and By-Laws of the Chapter, for a period of not less than one year prior to application for such membership, and the payment of such admission fees and monthly dues as may be established by the By-Laws; except that architects, who may have resided in other States, and who shall remove and locate themselves within the jurisdiction of this Chapter, shall, upon sufficient proof that they have practiced the profession as hereinbefore defined in this section, be entitled to *Fellow Membership* by complying with the requirements of the By-Laws.

SEC. 3. *Associate Membership* shall include such practicing and non-practicing architects as may not desire to become Fellows, and who shall pay into the funds of the Chapter the amount of admission fees and monthly dues prescribed in the By-Laws for Associate Members.

SEC. 4. *Draughtsman Membership* shall include those who shall be vouched for by two or more Fellows members, as being proficient in general office duties, but have not practiced as principals, and who shall pay into the funds of the Chapter the amount of fees and dues established by the By-Laws for Draughtsman Members.

SEC. 5. *Articled Student Membership* shall include those only who shall have studied architecture in the office of a practicing architect for a period of not less than one year next prior to seeking membership, and the payment of such admission fees and monthly dues as are defined in the By-Laws for Student Members.

SEC. 6. *Corresponding Membership* shall include those who shall contribute essays and original articles upon matters and subjects of Architectural, Mechanical, Constructive, and other scientific and practical import.

SEC. 7. *Honorary Membership* shall be conferred at the pleasure of the Chapter.

SEC. 8. *Life Membership.* Those who shall pay into the funds of the Society the sum of one hundred dollars shall be entitled to and enjoy Life Membership.

SEC. 9. In all cases of application for membership in either of the first four grades enumerated, the party desiring membership shall be regularly proposed in writing, by a Fellow of the Chapter, and seconded by another; the proposition to be submitted to an Investigating Committee, and upon the report of such Committee a ballot shall be had, whether the report of the Committee be favorable or unfavorable; and if not more than three adverse ballots are cast, he shall be declared elected.

SEC. 10. No member shall be entitled to vote upon the admission of members above the grade or rank of his own membership.

SEC. 11. All personal interest in the funds or property of the Chapter shall cease with the resignation of any member who shall resign, or from any other cause ceases to be a member.

ARTICLE VI.

MANAGEMENT.

SEC. 1. The management of the affairs of the Chapter, and the election of officers and members, shall be in accordance with the provisions of such By-Laws regulating the same as may be enacted by the Chapter, not in conflict with the Constitution.

ARTICLE VII.

AMENDMENTS.

SEC. 1. This Constitution shall be altered or amended only upon a two-thirds vote of the Fellow members present at a regular meeting, or a special meeting called for the purpose, at which not less than a majority of the Fellow members of the Association shall be present; the proposed amendment or alteration having been previously discussed at either a regular or special meeting, and the vote thereupon shall be taken by yeas and nays.

BY-LAWS.

ARTICLE I.

SEC. 1. The objects, aims, and purposes of this Chapter shall be as defined in Article II., and the OFFICERS as provided in Article IV., of the Constitution.

ARTICLE II.

MEETINGS.

SEC. 1. This Chapter shall convene in *Annual Session* the first Friday in September of each year, for the purpose of receiving the annual reports of officers, the election of officers for the ensuing year, and the transaction of such other general business as may be presented.

SEC. 2. The *regular meetings* of the Chapter, other than as provided in the preceding section, shall be held the first Friday in each month.

SEC. 3. QUORUM.—Five Fellow members shall constitute a quorum at all regular and special meetings.

SEC. 4. *Special meetings* of the Chapter may be called by the Secretary whenever the President or Vice-President shall be requested in writing by five Fellow members, setting forth the purposes in full of such meeting; but no other business than that specifically stated in said call shall be considered at such special meeting. The Secretary shall notify all the members of such special meetings when called, at least three days prior to the time fixed for said meeting.

ARTICLE III.

NOMINATIONS AND ELECTION OF OFFICERS.

SEC. 1. The officers of the Chapter shall be elected by written ballot at the regular meeting in the month of September of each year, and otherwise as may become necessary in cases of vacancies occurring from any cause.

SEC. 2. The *nominations* for annual election of officers shall be made at the regular meeting in the month of August of each year, either by open nominations, or through a nominating committee. But in either case, the names of the nominees must be presented to the Chapter at the regular meeting next prior to the time fixed for the election of officers, or at a special meeting called as provided in Section 4, Article II., for that purpose. But under no circumstances shall an election be held at the time and meeting when the nominations are submitted.

SEC. 3. The officers elected as provided in this article shall enter upon the discharge of their official duties on the evening of their election, *after* the annual reports of the retiring officers shall have been submitted to the Chapter.

SEC. 4. All officers elected as provided in this article shall hold office for the period of one year, or until their successors are elected; except that should any elected officer fail to discharge the duties of his office satisfactorily to the Chapter, his office may at any time be declared vacant by a majority vote of those present at any regular meeting of the Chapter, and the vacancy then and there be filled by nomination and election, provided the Secretary shall have notified the delinquent officer, by personal or postal service, of the intended action at least one month prior to such action being had.

ARTICLE IV.

REPORTS OF OFFICERS.

SEC. 1. At the annual meeting in each year, the respective officers of the Chapter shall make a full report in writing of all matters intrusted to their care, custody, or control during the terms of their offices, respectively.

ARTICLE V.

DUTIES OF OFFICERS.

SEC. 1. The PRESIDENT, or in his absence the Vice-President, shall preside at all meetings of the Chapter. In the absence of both the President and Vice-President, a presiding officer shall be chosen *viva voce*.

SEC. 2. It shall be the duty of the presiding officer to preside at all meetings of the Chapter, and preserve order therein; see that the Constitution and By-Laws are properly observed and enforced; that all officers and committees perform their respective duties; appoint all committees not otherwise provided for; have the casting vote in all cases of ties; the right to vote for admission of members and for officers of the Chapter; sign all warrants authorized by the Chapter; and perform such other duties and functions as are laid down in Cushing's Manual for presiding officers.

SEC. 3. The RECORDING SECRETARY shall keep a record of the proceedings of the Chapter, and of all matters of which record shall be deemed advisable by the Association. He shall also provide a registry in which the Constitution and By-Laws of the Chapter are inscribed, and secure the signature of every member thereto. He shall also have custody of the Seal and Archives of the Chapter, and preserve for reference all documents, reports of Committees, and papers which may from time to time be presented to the Chapter for its consideration, and all communications ordered to be "placed on file." He shall conduct all domestic corrsepondence, and draw all warrants upon the Treasurer for moneys ordered paid by the Chapter or the Executive Committee. He shall notify applicants for membership of their election, shall keep a complete roll of membership, and issue notices for all regular and special meetings of the Chapter.

SEC. 4. The CORRESPONDING SECRETARY shall conduct all foreign correspondence, by which it is understood all correspondence beyond the jurisdiction of this Chapter, as defined in Section 2 of Article V. of the Constitution, and shall perform the duties prescribed in Sections 4 and 5 of Article XI. of the Constitution and By-Laws of the American Institute of Architects, and perform such other corresponding duties as the interests of the Chapter may require.

SEC. 5. The records and correspondence of the Chapter shall at all reasonable times be open to the inspection of any member of the Chapter in good standing.

SEC. 6. The TREASURER shall collect all moneys due the Chapter, and disburse the funds only as directed by the Chapter, or upon the order of the Executive Committee, duly signed by the President and Recording Secretary.

SEC. 7. He shall keep the accounts of the Chapter in books belonging to it, which shall be at all times open to the inspection of the officers; and shall report at every annual meeting, and oftener if required, on the state of the funds.

ARTICLE VI.

PROPOSITIONS FOR MEMBERSHIP.

SEC. 1. All propositions for membership must contain the names and residences of the applicants and their referees, and that of the party proposing. The application, being in due form, shall be referred to a Committee of three, appointed by the presiding officer to investigate the standing and qualifications of the applicant. Such Committee to report the result of their investigation at the next ensuing regular meeting.

SEC. 2. No application for membership shall be acted upon at the meeting upon which the same shall have been submitted to the Chapter, other than the appointment of an Investigating Committee.

SEC. 3. Upon the report of such Committee, the Chapter shall proceed to ballot, and if not more than three of the members present shall vote against the applicant, he shall be declared elected, and admitted to membership.

SEC. 4. Corresponding, Honorary, and Life Members shall be proposed and elected by ballot, subject to the provisions of Section 1 of this Article.

SEC. 5. The admission fee provided in Article VIII. shall accompany all applications for membership.

SEC. 6. Rejected candidates shall not be again proposed for a period of six months following their rejection. And no ballot resulting in the rejection of a candidate shall be reconsidered without the *unanimous assent of all those who participated* in, and at time, place, and meeting when such unfavorable balloting shall have been held, and before any who may have voted shall have retired.

SEC. 7. Candidates elected to membership, who shall fail for a period of three months to signify their acceptance thereof by signing the Constitution and By-Laws, and paying the initiation fee, shall be considered to have declined affiliation; and can afterward obtain membership only by reproposal and election.

SEC. 8. Applicants for membership shall *not be present* during the reading and consideration of the report of the Investigating Committees in their cases respectively, except by special invitation of the Chapter.

ARTICLE VII.

MEMBERSHIP—PRIVILEGES—MANAGEMENT.

SEC. 1. The *membership* of this Chapter shall be as defined in Article V. of the Constitution.

SEC. 2. The management of the affairs of the Chapter shall be vested in the "Fellow members."

SEC. 3. *Associate members* shall be entitled to all the benefits of the Chapter; the right to participate in all debates and discussions of a technical character; to vote on applications for membership other than of Fellows, but shall have no right to vote on matters of legislation, and questions before the Chapter for its decision, nor to hold office.

SEC. 4. *Draughtsman members* shall enjoy the rights and privileges accorded to Associates, except that of voting for the admission of Associate members.

SEC. 5. *Articled Student members* shall be entitled to the privilege of attending the regular and special meetings of the Chapter; may enjoy the right, by permission of the Chapter, to present and debate matters of special interest to their class, and to ask for information upon matters and subjects of special interest, but shall have no right to vote, except upon the admission of Student members.

SEC. 6. *Corresponding, Honorary, and Life Members* shall enjoy all the rights and privileges of the Chapter, except that of voting and holding office; except that the rights and privileges of members of the Chapter who become Corresponding, Honorary, or Life Members shall not be affected thereby.

SEC. 7. It shall be the duty of Draughtsman members, upon beginning the general practice of the profession, to notify the Secretary of the fact; and after having so practiced for the period of one year, they should cease to be Associates, and become Fellows. Associates who may desire advancement to membership as Fellows, shall make application to the Chapter in writing, which application may be acted upon without delay, or by majority vote of the Fellows present, be referred to a Committee of three, and be subject to the provisions of Section 1, Article VI.

SEC. 8. No member who shall be over six months in arrears shall be entitled to vote or hold office; and if twelve months or more in arrears, shall be considered as having withdrawn, and can only be reinstated by being balloted for as at first, and upon payment of all indebtedness to the Chapter.

ARTICLE VIII.

FEES AND DUES—RESIGNATIONS.

SEC. 1. The admission fee for membership in this Chapter as Fellows shall be six dollars; Associates, four dollars; Draughtsmen, three dollars; Articled Students, two dollars. Members of the subordinate grades may advance to Fellow membership by paying the additional fee, making the total sum of six dollars.

SEC. 2. The dues for Fellow members shall be six dollars yearly; for Associates, four dollars; Draughtsmen, three dollars; and Articled Students, two dollars—payable in each case in two (or one, if preferred) installments, respectively maturing and payable the first day of September and March of each year.

SEC. 3. Any member who shall have paid the annual amount of dues, and who shall be absent from the jurisdiction of this Chapter for the continuous period of one year, shall be exempted from the payment of dues accruing during the period of his absence, if he shall have previously given written notice to the Secretary of his intention to be absent.

SEC. 4. All *resignations* shall be submitted in writing to the Secretary, who shall present the same to the Chapter at the next ensuing meeting. But a resignation shall not discharge the member presenting it from the payment of unpaid dues.

ARTICLE IX.

ORDER OF BUSINESS, AND RULES OF ORDER.

SEC. 1. 1. Calling the Roll.
2. Reading Minutes of Previous Meeting.
3. Reading Minutes of Special Meeting.
4. Reports of Standing Committees—Executive, Trustees, Finance, etc.
5. Reports of Special Committees.
6. Reports of Committees on Applications for Membership.
7. Balloting on Applications for Membership.
8. Propositions for Membership.
9. Annual Address.
10. Reading Communications.
11. Unfinished Business.
12. New Business.
13. Reading of Papers, Debates, Addresses, etc.

SEC. 2. RULES OF ORDER may be suspended by a majority vote of the Fellows present. But NO BY-LAW of this Chapter shall be suspended under any circumstances, except as provided in Article XIV.

SEC. 3. At the annual meeting of each year the President, or such other person as he shall designate for the purpose, shall deliver THE ANNUAL ADDRESS.

SEC. 4. No motion or resolution shall be debated until it shall have been duly moved and seconded and each speaker shall be confined strictly to the motion under consideration.

SEC. 5. No question shall be stated by the Chair unless properly moved and seconded, nor be open for discussion until stated by the presiding officer; and while a motion is pending before the Chapter, the only motions in order shall be:

1. To Lay on the Table.
2. The Previous Question.
3. To Indefinitely Postpone.
4. To Definitely Postpone.
5. To Recommit.
6. To Refer.
7. To Amend.

Each of which shall have precedence in the order in which they are arranged; and the first three shall be decided without debate.

SEC. 6. The previous question shall be put only when demanded by a majority of members present entitled to vote. When so demanded it shall be in the following form: "*Shall the main question now be put?*" If decided affirmatively, the main question shall then be put without further debate.

SEC. 7. An amendment to an amendment shall be in order, and take precedence of the amendment; but a motion to amend an amendment to an amendment shall not be entertained.

SEC. 8. A substitute shall be considered in the light of an amendment, and shall be treated as such. But no substitute or amendment shall be entertained, the object of which shall, in purpose or effect, introduce a subject different from that under consideration.

SEC. 9. The proceedings of the Chapter, not otherwise provided for, shall be governed by the rules and parliamentary usages and practices laid down in "Cushing's Manual."

SEC. 10. Discussions of religious or political subjects shall not be permitted at any meeting of the Association.

ARTICLE X.

EXECUTIVE COMMITTEE.

SEC. 1. The President, Vice-President, Recording and Corresponding Secretaries, and the Treasurer of the Chapter, together with the Board of Trustees, shall constitute an Executive Committee.

SEC. 2. The duties of said Committee shall be to exercise control and supervision over the affairs of the Chapter, provide rooms, make all purchases and contracts not otherwise provided for, but shall not incur any liabilities in excess of the amount of unappropriated funds in the hands of the Treasurer, except by special instruction from the Chapter, and shall perform such other service as may be for the best interest of the Chapter.

SEC. 3. Said Committee shall make a full written report of its acts and doings at the annual meeting, and whenever required by the Chapter, which reports shall be filed in the archives of the Chapter.

SEC. 4. The President and Recording Secretary of the Chapter shall act *ex officio* as officers; five members constituting a quorum of the Committee.

ARTICLE XI.

TRUSTEES.

SEC. 1. At the annual election of officers in each year, there shall be elected by ballot three Trustees, who shall hold office for the period of one year, or until their successors are elected.

SEC. 2. Said Trustees shall organize as a Board as soon after their election as practicable, by the election of a Chairman and Secretary.

SEC. 3. The duties of said Trustees shall be to take charge of, and hold in trust for the Chapter, all funds over an amount in the hands of the Treasurer necessary to meet the current expenses of the Chapter; all property and valuables which may come into the possession of the Chapter by gift, purchase, transfer, or otherwise; deposit all moneys in their possession, belonging to the Chapter, in such bank or savings institution, or invest the same in such securities, as the Chapter may from time to time direct. They shall also make a full written report of their official acts, and the state and condition of the funds, investments, and properties of the Chapter at each annual meeting, and whenever required by the Chapter. And at the expiration of their terms of office, they are to deliver up all moneys, properties, and valuables of every nature and kind, together with all books, papers, and other things belonging to the Chapter.

SEC. 4. Each Trustee shall give a separate bond for the faithful performance of his duty, in such amount as the Chapter may from time to time require.

ARTICLE XII.

DEPORTMENT AND PRACTICES OF MEMBERS.

SEC. 1. Should any member be reported to the Chapter in writing, by any responsible party, under a properly attested affidavit, as guilty of unprofessional practices or disreputable conduct, calculated to reflect reproach upon the profession and this Chapter, the matter shall be referred to the Executive Committee for investigation; and said Committee shall notify the member so charged, requesting his attendance at a meeting of the Committee appointed for the purpose; and after a full investigation of the charges and facts, the Committee shall have the power to dismiss, or report the case to the Chapter for further action.

SEC. 2. Should the Committee find the charges of sufficient importance to justify action on the part of the Chapter, they shall prepare a statement to that effect, with recommendations as to the proper course to be pursued.

SEC. 3. Should the charges be sustained, the offending member may be reprimanded by the chair, censured by a vote of the Chapter, or be expelled by two-third vote of the Fellows present voting in favor thereof, provided that the offending member shall have been notified of the action of the Chapter, and allowed one month to arrange and make his defense.

SEC. 4. A vote involving censure or expulsion shall be decided by ballot. Two-thirds of those present and entitled to vote being necessary in all cases of expulsion.

ARTICLE XIII.

DUTIES OF AN ARCHITECT.

All of the following are included in the ordinary charge of five per cent.

Preliminary sketches.
Working drawings and plans sufficient for an estimate and contract.
Preparation of contract and bond if required.
Detailed drawings and instructions for execution.
General superintendence of works (exclusive of clerk of works).
Examining and passing the accounts, and certifying to payments.
Preparing rough estimates of cost by cubing or otherwise.

An architect is bound, under the five per cent. charge, to provide one set of drawings and one set of tracings, with duplicate specification; it being understood that the architect is paid for the *use* only of the drawings and specification, and that they remain the property of the architect.

PROFESSIONAL PRACTICES AND ARCHITECTS' CHARGES.

The following Scale of Charges for Professional Services is strictly in accord with, and not in excess of, those established by the American Institute of Architects and the Chapters under its jurisdiction in New York, Boston, Rhode Island, Philadelphia, Albany, Baltimore, Chicago, Cincinnati, St. Louis, and other States and cities of America, and the Architectural Societies of England, France, Germany, Sweden, and other European countries.

For full professional services (including superintendence), 5 per cent. upon the full cost of the work.

Partial Services:

For preliminary studies, 1 per cent.

For preliminary studies, general drawings, and specifications, $2\frac{1}{2}$ per cent.

For preliminary studies, general drawings, details, and specifications, 4 per cent., exclusive of superintendence.

For works costing less than $5,000, and for monumental and decorative work, designs for furnitnre, etc., special rates in excess of the above.

For the alteration and remodeling of buildings previously erected, an additional charge to be made for surveys, measurements, etc., according to the time, skill, and trouble involved. An additional charge to be made for alterations and changes in plans after they shall have been prepared according to agreement and instructions given by clients.

All traveling expenses and the value of extra time required in traveling to be paid by clients, in cases where the work in hand is beyond reasonably easy distance from the architect's office.

Additional charges to be made for visits for professional consultations, and in accompanying travel, whether by day or night; in negotiations for sites, party walls, and all services incidental to general operations.

The payment of architects' fees shall mature as the work progresses, one-half the amount thereof being payable upon completion of the plans and specifications on buildings and works costing less than $10,000, with earlier payments on larger operations, and additional payments as the work progresses, with final settlement upon completion.

Until the actual cost of contemplated work is determined by competitive or other competent estimates, the charges for architects' services are to be based upon the *proposed* cost thereof.

Architects are entitled to professional compensation upon the *entire cost* of the building or works when completed, including all fixtures and appurtenances necessary to render the same fit for use or occupancy. Also to a fair additional compensation on furniture, or other articles designed or purchased by the architect.

Should the owner have come into possession of, or in any way furnish, materials of any nature or kind required in the execution and completion of any building or works, the true value thereof shall be computed and added to the sum of all contracts, and the architects receive commissions upon the total sum.

Drawings, as instruments of services, are in all cases the property of the architect.

In cases of failure of contractors to complete the work undertaken, thereby involving extra labor, trouble, and vexation upon the architect, the architect shall be entitled to extra compensation, according to the extra services required.

Valuations.—The following definite charges are recognized:

For Valuation of Property, the charge throughout is one (1) per cent. on the first $5,000, and one-half ($\frac{1}{2}$) per cent. on the remainder, up to $50,000. Below $5,000, and beyond $50,000, by special arrangement. These charges do not include traveling expenses, nor attendance before juries, arbitrators, etc.

Arbitration Fees.—The charges shall be regulated according to the time and professional skill required, based upon a charge of not less than $25 per day to each party, for each and every day of such service. The time occupied each day, whether one or more hours, shall constitute a day in this connection.

Per day.—The charges per day which shall be made by practicing architects depend upon their professional position; but the mininum charge shall not be less than fifteen dollars per day. The full time employed in traveling, making estimates, preparing statements, etc., to be included.

The charge per day *for draughtmen's* services employed in architects' office shall be ten dollars, including the supervision of the architect, and the usual office expenses of paper, ink, etc.

Clerk of Works.—In work of importance, where a "clerk of works" is necessary, he shall be appointed by or with the consent of the architect, as the proper carrying out of plans and specifications can only be secured when such clerk of works shall be fully competent, and willing to obey and enforce the directions of the architect. The owner to pay the expense of said clerk of works.

Competition.—In all cases where designs in competition are solicited, the architects accepting should receive a true and definite list of those against whom they are to compete, and should also be paid a reasonable sum for their services, according to the extent of the work, whether successful or not. Competitions should not extend beyond works of a *public character*.

The sum offered as premium should never be merged in the architect's usual commission, but should be considered an honorary reward for the skill displayed, and as an offset to the risks and uncertainties of a competition.

Sketches and Consultations.—In cases where an architect prepares sketches for work, or is consulted and gives advice, and his services are not further required, charges for said sketches or consultations are to be made—the basis of charge being the time employed. If the sketches shall have been studied, and drawn out so far as to exhibit a complete design, the charge is one (1) per cent. on the estimated cost of the work; the sketches in all cases remaining the property of the architect.

Superintendence and Detail Drawings.—In the making up of the five per cent. usual commission, two and one-half per cent. is to be considered as the proper apportionment for the contract drawings and specification, one and one-half ($1\frac{1}{2}$) per cent. for the detail drawings, and one (1) per cent. for the superintendence. No member of this society shall recive any fee or compensation for his services from any person or persons other than his original employer.

Changes in Plans.—In cases where an architect shall have prepared plans according to the instruction and approval of the owner, and for any cause or reason, either before or after the same shall have been submitted for estimate, the owner shall change his purposes, and abandon the execution of a part or portion of the improvements contemplated by the original drawings, the architect shall be entitled to full compensation, as though no changes had been made; and also to compensation for all additional work and drawings rendered necessary by such changes.

ARTICLE XIV.

DUTIES AND RIGHTS OF MEMBERS.

SEC. 1. It shall be the duty of all members of this society to aim at excellence in conduct and qualification; to have an eye single to the interests of their employers, and to the advancement of the art; and while, in nature of society and business, each will come into competition with the other, our emulation should be to perform the *best* work, rather than the most of it.

SEC. 2. It shall be the duty of all members of the Chapter to maintain their rightful authority in the direction of all work under their charge, not recognizing the right of interference from any source; and to discourage and discountenance all methods of obtaining professional engagements, not of a worthy and reputable character, and by direct negotiations with owners or their *legal* agents.

SEC. 3. It shall be the duty of the members of this Chapter to refrain from and discountenance any and all attempts to supplant a fellow-member by proposals abating charges, or by any other violation of the strict rules of right and honorable practice, so as to deprive him of any properly and fairly secured business advantage or engagement.

ARTICLE XV.

AMENDMENTS.

SEC. 1. These by-laws may be amended at any regular meeting of the Association, provided that the proposed amendments shall have been submitted and read at a previous regular meeting, and also a copy thereof in printed form delivered or mailed to each member at least twenty days prior to the date of proposed final action thereon. A two-thirds vote of the members present and entitled to vote shall be necessaryto final adoption.

SEC. 2. All amendments adopted as provided in Section 1 shall take effect immediately after adoption, unless otherwise specially provided.

UTILIZE YOUR BASEMENT APARTMENTS

SEE ALL NEW BUILDINGS ON THE BEST BUSINESS MART.

The present dark, damp Cellars, or Coal Vaults, of old buildings made light, cheerful, and well-ventilated Business Apartments suitable for Offices.

Read the following of the many Testimonials received:

LEVI STRAUSS & CO., Importers, 14 and 16 Battery Street,
SAN FRANCISCO, March 4, 1881.

MESSRS. P. H. JACKSON & CO., No. 2 California Street:

The alteration made by you by cutting out the six door sills and risers on the front part of our store, 14 and 16 Battery Street, and substituting HYATT'S PATENT ILLUMINATING ROOF, is quite satisfactory in making in the basement apartment below, in the front part, all that we could desire as regards light. **Our entry clerks are now able to work without the use of gas.**

LEVI STRAUSS & CO.

The **Basements of Messrs. Murphy, Grant & Co's Buildings,** on Bush and Sansome Streets, have been altered and are now lighted by this Improvement.

HYATT'S PATENT

FIRE AND BURGLAR-PROOF SKYLIGHTS.

The Public are requested to examine the **large quarter circle** skylights, recently erected in the rear of **Senator Fair's** building corner Sansome and Pine. Also **A. B. McCreery's** building corner of Pine and Davis. By the use of these heavy Skylights, which are both fire and burglar-proof, **no extra charge in rates is made by the Insurance Companies than if no Sky-lights were used,** as they are not destroyed by fire, like the wood and sheet-iron skylights in common use; besides the occupant of the premises may feel his goods are safe from robbers during the time the building may be closed.

☞There are many deep stores in this city that are much in need of light, and by an addition of these Skylights all light can be obtained, besides security againt thieves is maintained.

The appearance of the Skylight, as seen from the front of the store when the sun is on it, glistens with the thousands of hexagon lens. The Cosmopolitan Building, as altered, has these Skylights on the rear of the deep stores.

SUBURBAN RESIDENCE.—Designed by Walter Ferriss.

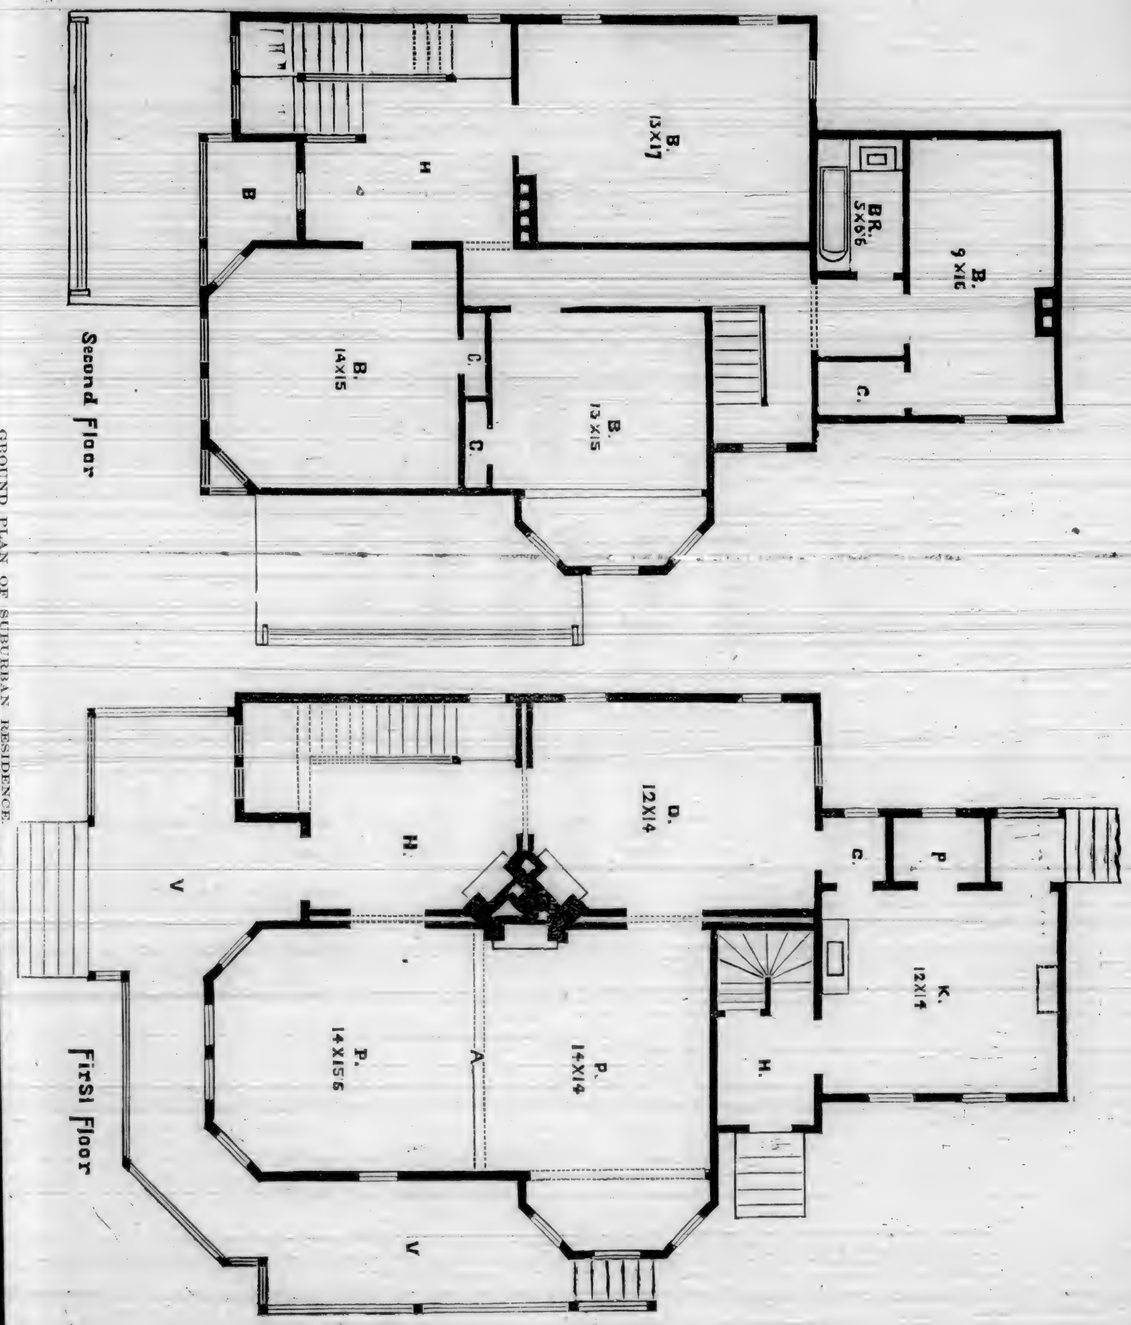
Nice Times for Architects and Artisans in the Fourteenth Century.

"Wyckham was Bishop of Winchester, but it must be remembered that during the Middle Ages there were no architects but what were monks or ecclesiastics, as all the learning was confined to the monasteries.

"Wyckham was paid by the king *one shilling daily* as salary, and *three shillings a week* for his clerk of the works, as architect of the castle palace—a gorgeous style of composition introduced by Wyckham in the royal palace of Windsor during a reign of this patron, Edward III. To obtain artisans, the king issued writs to the sheriffs of several counties, directing them under a penalty of one hundred pounds to provide a certain number of workmen, and send them to Windsor within ten days, to be employed at the king's rates of wages, as long as was necessary. And because divers of these workmen did afterward clandestinely leave Windsor, and were entertained by other persons upon greater wages, to the king's damage and manifest delay of his work, the sheriff's were ordered to make proclamation that those persons who should presume to employ any of the fugitive artisans should be dispossessed of all their property. The sheriffs were also directed to arrest the runaways, and commit them to Newgate."

Beading Circular Work.

A common thumb-gauge may be very readily converted into a labor-saving tool for sticking beads—either edge quirk, or center beads—by slitting one end of the gauge tail and fastening the bit of any bead plane in it in an upright or plumb position. The slot in the gauge should be made long enough to leave room near the end for putting in a screw so as to tighten the bit. This tool makes a scraping cut, which, although not as smooth as may be done on straight work, may be made to look tolerably fair by sandpapering well. The general form of the beaded work will be far superior to that worked out by hand.



GROUND PLAN OF SUBURBAN RESIDENCE.

Sash Windows.

The sash window is one of those modern inventions which persist in spite of tastes and numerous modifications. It seems to have been introduced about the period of the Classic revival in England, and to have maintained its position as the most convenient kind of window fitting. Architects have never been very partial to it; during the Gothic mania it was abused more than any other feature of modern houses, and was pronounced one of the ugliest remnants of Classic taste. The French casement and the mullioned window have been always more popular. One of the stock arguments used by the Gothicist during the "Battle of the Styles" was the use of too prosaic a form, while on the other side the Classicist was not inclined at all at that time even to defend a feature which he had been endeavoring to improve. As every one knows, there was, and is still, a strong desire to conceal the framework, either by painting the woodwork black or some dark shade, or by inserting plate glass in the frames. We have lived to see a very opposite fashion set in. The Queen Annist rejoices to make the frames a visible part of the window, and to fill the sashes with as many small panes of glass with thick, white bars as he can. But it is with the various improvements that have been made in the mechanism of the sash window that we are now concerned. Several modifications have been made and patened for opening window sashes and for cleaning them. Though the casement window has been admired, it has had a bad reputation for failing to keep the wet out, in spite of numerous ingenious appliances for fastening. The recent patents that have been brought out for lifting windows, and for enabling the sashes to be opened for cleaning, are evidences of a desire to improve and perfect an appliance that has met with public approval, and which is now a pronounced feature in modern houses. The chief mechanical drawbacks of the sash window are the difficulty of raising heavy sashes, the want of a lifting power, the tendency of the sash to hang on one side, difficulty of cleaning the sashes, the breakage of the cords, the inefficiency of the usual window fastenings, and the rattling of the sashes in windy weather. Many if not all of these drawbacks have been made the subjects of patents. Thus we have the admirable arrangement of Mr. R. Adams, the "anti-accident window," by which the sashes are balance pivoted, so that either of the sashes can be turned round so as to enable the outside to be cleaned without risk of accident; another (Philips') "reversible" window, constructed on a similiar plan, and for the same purpose, by which the ordinary sashes can be made to swing round for cleaning from the inside. In this case the sashes are hung clear of the slips and inside bead; the check to the wet being made by rabbeting the side of the sash and fixing in it a metal bar with a screw, the latter being made to form the pivot for turning on. Other various patents have been introduced for hanging the sashes, so that they may be removed from the frames without taking off the inside beads. Gurman's sash pocket is a simple method, though not now generally known, by which the weights can be easily taken out and the sashes cleaned. Bullivant's patent is another well-known modification. Messrs. Leggott are the patentees of a window lift and fastener which command approval. By the action of a screw working into a rack in the sash frame both sashes can be opened simultaneously, or only the bottom sash. Sash cords and weights are thus dispensed with, and a source of trouble and expense avoided, and no sash fastener is required, as the sashes are locked by the screw and rack motion in any position. Another invention recently patented, the "imperial window," facilitates ventilation and cleaning. The top sash is made longer to run up into a casing about 12 inches, so that it can be lowered for ventilation at the meeting rails, and other improvements are made by which the sashes can be readily taken out and cleaned. The old-fashioned sash lines and weights are certainly behind the age; the inconvenience, difficulty of removing the beads, taking out the pocket pieces, and repairing the lines, are well know by all householders; and any suggestion for hanging the sashes without cords and weights is worthy of consideration. There is, of course, a mechanical difficulty in doing this so as to allow only one sash to be open at a time, but it is easy to devise means of getting at the weights and cords without the trouble it now entails. It is an advantage, too, to make the sashes so that they can be balanced on pivots, or raised in a horizontal position. The air-tight tongues which are withdrawn into grooves by turning a key enable either of these positions to be attained very quickly, as in Mr. R. Adam's reversible window; and windows with these movable tongues can be made very air and dust tight—not a small advantage in crowded town streets.

Many devices have been proposed for opening and closing sash windows, particularly wide, heavy sashes with plate-glass. One of the best of these is Meakin's "self-acting sash fastener and opener," too well known to need description here. In the same class of appliances the architect ought not to lose sight of Adam's patent fanlight opener, or the rack and screw adjustment of Messrs. Leggott. It is unnecessary to name other ingenious appliances of the same kind, our objects being merely to indicate a few of the principal aims, in all of which the advantages of the sliding sash window are preserved and maintained. The simplest of these appliances are the best. The advantage of the sash window over other forms is that it does not occupy room; it can be opened or closed in its own area (a great consideration in town houses) the sashes can be regulated at pleasure to allow any amount inlet and outlet of air, one of the best forms of ventilation, and, if properly constructed, it is the securest form of window, and the most water-tight. The present style of building has brought the sash window into repute again, and the villas and suburban dwellings of the metropolis are now all filled with them. Few of these, however, are fitted up in a style superior to that of windows of fifty years ago. Very seldom we find any attempt made to introduce improvements of the kind we have mentioned. The sash lines and weights are of the commonest description, the pulley stiles have no arrangement for easy access to the weights, the sashes shake about, and the window sill is seldom properly double sunk or grooved; the fastenings are of the most trumpery kind, and there is no plan by which the sashes can be cleaned except by getting outside. It may be asked, Why are not these inventions now more generally adopted? The speculative builder has no inclination to introduce specialties in building; so long as the tenant is satisfied with the old arrangements, he does not feel himself justified in going in for fittings of an expensive character. The smaller class of tenants have not the desire or inclination of saving trouble to themselves or promoting their own comfort; but the architect has no such excuse to plead for not specifying the best means of saving the domestic labor and insuring domestic completeness. Some of these appliances have been disregarded by the profession on account of their complexity, or that they are too cumbrous for every-day use; and this is a fault which inventors are very apt to commit, and which a little more thought would have enabled them to avoid.—*Building News.*

The Hammer.

Taking as its text the ancient legend of the Mechanic's Associations, "By hammer and hand, all arts do stand," the *Economist* pays the following glowing tribute to this implement of industry:

The hammer is the universal emblem of mechanics—those skilled in uniting and binding together of meterials. With the hammer are alike forged the gliding sword of contention, and the dusty plowshare of peaceful agriculture. Its workmanship ornaments the trappings of war, and nails the olive-branch of peace above the gate. In ancient warfare it stood pre-eminent, apart from the instruments it wrought and formed. The old battering ram of the Greeks was nothing but the rude conception of a huge hammer. In heathen mythology it was always the symbol of might and strength. It was the sole weapon of the dreaded God of thunder, Thor, the mighty rival of Odin. His hammer was fashioned by cunning dwarfs, and possessed the wonderful property of returning to his hand after being hurled. To the heathen Teutons the sign of the hammer was analogous to that of the golden cross of Christianity. In the hammer lies the wealth of a nation. By it are forged the ponderous engines that almost shake the world, and the tiny needle which unites alike the costly silks and satins of a queen, and the rough homespun of a laborer.

The hammer, too, is no partisan. It is an instrument of the savage and the civilized. Its merry clink points out the abode of industry and labor. Its handle is extended, inviting all to grasp, and with its unyielding head, by the help of the strong arm, forges happiness and prosperity. It is, in fact, a domestic deity presiding over the aspiration of wealth and ambition. Not a stick is pointed, not a house is built, not a ship floats or a carriage rolls, or a wheel spins or an engine thunders; not a press speaks or a bugle peals, a spade delves or a banner floats—without having endured the blows of the hammer. So it instructs and teaches us that great ends and large results can only be accomplished by good, hard, vigorous blows. That if we would attain usefulness, and reach the full perfection of what we are capable of becoming, we must not shrink back from the hardships, buffetings, and hard knocks of life, but early learn to cultivate the power of patient endurance.

Scientific Paradoxes.

The water which drowns us can be walked upon as ice. The bullet which, fired from the musket, carries death will be harmless if ground to dust before being fired. A chrystallized part of the oil of roses, so graceful in its fragrance, a solid at ordinary temperatures, though readily votatile, is a compound substance, containing exactly the same elements, and exactly the same proportions, as the gas with which we light our streets. The tea which we daily drink, with benefit and pleasure, produces palpitations, nervous tremblings, and even paralysis if taken in excess; yet the peculiar organic agent called "theine," to which tea owes its qualities, may be taken by inself (as theine, not tea) without any appreciable effect. The water which will ally our burning thirst augments it when congealed into snow, so that Captain Ross declares the natives of the Arctic rerions "prefer enduring the utmost extremity of thirst rather than attempt to remove it by eating snow." Yet if the snow be melted, it becomes drinkable water. Nevertheless, although if melted before entering the mouth it assuages thirst like other water; when melted in the mouth it has the opposite effect. To render this paradox more striking, we have only to remember that ice, which melts more slowly in the mouth, is very efficient in allaying thirst.

Hygiene in Painting.

Hygiene relates to considerations for the general promotion of health and the prevention of disease; but we are now going to show wherein painting affects the health of those who dwell in city-built modern houses. A new house, when completed and freely ventilated, offers you a clean habitation, with its bright, cheerful rooms full of new odors emanating from the fresh combination of materials utilized in its general make-up. You feel imbued with a sense of purity in the atmosphere that fills each apartment, as you pass through the several suits that form the domicil; it exhilarates the senses, and sends a good cheer streaming through every fiber of of your body, and are thus made happy by the *newness* you see, feel, and breathe. These effects do not appear when you chance to enter an old house with a label on it "To Let"; but, on the contrary, the odors are numerous, your senses are shocked, a repulsive feeling takes possession of you, and in disgust you quit the tenement for a breath in the open air. Now, we believe that a large percentage of buildings in this city that have been promiscuously occupied by the moving and roving house population are detrimental to health. For when we take into consideration the thousands of humanity that have occupied these houses from time to time as dwellings, any one of which has thrown off in exhalations a vast amount of impurities from their bodies as waste upon the air contained in these badly ventilated tenements. The porous system is said to contain 28,000 pores to the square inch, or about seven millions for the entire surface. These in healthy persons are constantly throwing off impurities from our bodies, or useless matter, which, if retained, act as poisons to the system. Then the freighted air which carries off this effete matter, being impeded in its progress, deposits some of its burden on the walls or wood-work of every appartment, and thus the work goes on for years. The landlord is called upon to clean the house, and it is whitened, not cleansed, and this is all that he can afford to do, say his agents. The interior of houses are suffered to go on from year to year accumulating the solid accretions of unhealthy matter, and in many cases of noxious effluvia, which in time disseminate its deathly seeds to whole families, and the fatality is ascribed to other remote causes. The present style of painting common houses inside is to paint and grain the entire wood-work, because it is so easily cleansed, but is never thoroughly done. This style of work is undoubtedly good in all living rooms and hall-ways; but the parlors and sleeping apartments should be done in plain color, the body coats of lead paints, and finished with zinc in a flat or glossless finish. The object of painting rooms in this manner is to have them in a condition that subsequent coats of thin layers can be easily applied when deemed necessary for the thorough disinfection of the premises. The walls, when done in distemper colors, carry more by absorption than paints in oil, and for that reason they need entire removal before renewal. This remark applies to all compositions of whitening or zincs, and then the new coats will be fresh, sweet, and clean. To renovate a house after years of occupancy, it is necessary to remove all former accumulations by scraping and washing before new work is applied. Then will follow the painting, whitening, graining, and varnishing, and when this work is accomplished the house will once more be fitted for habitation. There are a large amount of the "to let" tenements that are never thoroughly cleansed; because the rentals are low, property is allowed to depreciate for want of healthful repairs. A house that is properly kept up to the sanitary requiremets of health will not wait long for a tenant, and will rent enough better to pay the owner a handsome return for the outlay. There is nothing that attracts the attention of those who want a home more than a fine-looking house, bright and cheerful in aspect, as to exterior; then the interior should have its counterpart fresh from the painter's hands, making it fit for any one who loves a sweet home. J. E. W. C.

What Mechanics Read.

From G. C. W., *Lockport, N. Y.*—In a late number a correspondent says that he is astonished at the statement of Mr. Robert Riddell, that 95 per cent. of the mechanics of this country are regular patrons of dime novels and the light literature now so generally published. If the 95 per cent. represented real mechanics he would have cause for his feelings, but the facts of the case are that the 95 per cent. are not mechanics. Five per cent. may be mechanics, but the others are not deserving the name. The 5 per cent. stow away more sound sense in one evening's reading than the 95 per cent. are capable of mastering in a month. Here is a specimen of one of the 95 per cent. fellows, taken from Chordal's letters. He says: * * * * I was in the office of a certain engineer the other day, and a mutton-headed boy about 19 years of age came in. He was a machinist. His father owned a shop, and he had served his time in it. He wanted to learn to "draft," he said. Said his father wanted him to learn; he wanted to learn himself, and his father would pay all reasonable bills. Torsion, the engineer, began to catechise him. "What have you ever drawn?" "Nothing." "What have you ever wanted to draw?" "Nothing." "What have you ever made rude sketches of?" "Don't know as I ever wanted to draw anything, and could not make a 'draft' if I wanted to, because I never learned how." "That's all right," said Torsion, "you will never draft anything, and will never be wanted to. I'll see your father this week." Torsion turned to me and said he had a dozen such fellows to deal with every month, and treated them all the same. "But," said he, "when some greasy boy slips in here and pulls out some horribly original drawing, and asks me why the ink lines run when he puts color on, or how a fellow's to judge good India ink, or how this thing is to be drawn so another can understand it, then I quit work and stay by that fellow, and place my time, library and office at his disposal."—*Carpentry and Building.*

Market Reports.

LUMBER.—Stirring times with steady demand is all that can be said of the market the past month.

Receipts since January 1st, 1882:	
Lumber	108,573,868
Shingles	22,921,761
Laths	8,409,350

A correct price list of lumber will be found below:

PAINTS.—A new company has made its appearance, introducing the OMAHA WHITE LEAD. With the large demand that is confidently expected this year, the agents should be able to control a fair amount of patronage.

The PIONEER brand has been successfully introduced into every town and hamlet on the Pacific coast, and has given universal satisfaction. We quote price at 8 cts. per lb. and 7¾ cts. in "ton" lots.

Building Intelligence.

SAN FRANCISCO.

Owing to the large number of buildings at present being erected, we have deemed it necessary to abbreviate the terms used. Hence in this and in future issues the following letters will have the accompanying meaning: *A.*, architect; *C.*, contractor; *O.*, owner; *O.* and *B.*, owner and builder. The points of compass by E., W., N., and S.

Improvements on lot S. W. corner Mission and Fifth, four-story frame, brick basement, on Fifth street and three-story frame and brick basement on Mission street. Stores, dwellings, and lodging house. *O.*, P. J. Donohue; *A.*, T. J. Welch; carpenter work, J. W. Smith; brick work, O. E. Brady; plumbing, McNally & Co.; painting, B. Bradley; plastering, Headley and Mulvihill; total cost about $120,000.

Alterations and additions to block of buildings, S. W. corner of Taylor and Eddy. *O*, A. Chavanne; *A.*, A. Pissis; *C.*, G. W. Hansbrough; $16,000.

Five two-story frame dwellings N. W. corner California and Fillmore; *O*, E. F. Preston; *A.*, Schmidt & Havens; *C.*, R Smilie; $16,000.

Additions to building corner Golden Gate avenue, and Laguna street. *O.*, Mark Sheldon; *A.*, Wolfe & Son; *C.*, Moore Bros.; $8,500.

Two-story frame building, Eighteenth near Jessie. *O.*, J. F. Westheimer; *A.*, Wolfe & Son; *C.*, W. J. Peters; $2,200.

Six two-story and basement frame dwelling, on N. side Oak street, between Octavia and Laguna. *O.*, H. P. Hale; *A.*, Swain & Cleaveland; *C.*, Girvin & Munnis; $35,000.

Three two-story frame, S. side Sacramento, between Pierce and Steiner. *O.*, G. L. Reynolds; *A.*, Meeker & Banks; *C.*, J. Treadwell; $8,000.

Two-story frame, N. side California near Fillmore *O.*, E. J. Delaney; *A.*, Schmidt & Havens; *C.*, Walker Bros.; $6,000.

Two-story frame, W. side Fillmore, between Pine and California. *O.*, G. Robinson; *A.*, T. J. Welch; *C.*, Moore Bros.; $4,000.

Two-story brick building, Bay street near Webster; *O.*, Merry, Faull & Co; *C.*, Walker Bros.; *A.*, H. T. Bestor; $7,000.

Two-story and basement frame dwelling, corner Scott and O'Farrell. *O.*, J. Dowling; *A.*, R. Warren; days' work; $7,000

Two three-story frame, Mason near Pacific. *O.*, Shirley; *A.*, W. P. Moore; *C.*, A. Jackson; $9,000.

Two-story frame dwelling, S. E. corner Laguna and Sacramento. *O.*, L. F. Whitney; *A.*, H. D. Mitchell; *C.*, Mahoney Bros; $10,000.

Two-story and basement frame dwelling, N. side California near Fillmore. *O.*, J. O. Van Bergen; days' work; $6,000.

Two two-story and basement frame dwelling, corner Pine and Franklin. *O.*, G. W. Webber; *A.*, T. J. Welch; *C.*, J. Dougherty; $8,000.

Wharf and one-story building at Pacific Rolling Mills. *C.*, Richardson; $48,000.

Repairs to three-story frame, corner Sierra and Louisiana. *O.*, Pacific Rolling Mills; days' work; $4,000.

Two-story frame building, Potrero Point. *O.*, Pacific Rolling Mills; days' work; $1,900.

Two-story frame building, Filbert street between Montgomery and Sansome. *O.*, P. McDermott; *C.*, J. Dougherty; $2,500.

Two-story frame, Polk near Ellis. *O.*, A. Gurdis; *C.*, Watts; $2,800.

Two-story frame dwelling with stable, on Cedar avenue near Larkin. *O.*, Mrs. Gunter; *A.*, A. Schroepfer; *C.*, H. Meyn; $3,850.

Two-story and attic, brick basement, corner Van Ness avenue and Willow avenue. *O.*, W. B. Summers; *C.* and *B.*, W. H. Wharff; $12,000.

Additions to three-story frame, N. side Ellis between Van Ness avenue and Franklin. *O.*, Mrs. Armstrong; $2,000.

Two-story and basement frame, E. side Gough near

O'Farrell. *O.*, T. R. Church; *A.*, J. C. Pelton; *C.*, T. J. Hamilton; $10,000.

Two two-story and basement frame, S. E. corner Scott and O'Farrell. *O.* and *B.*, J. Dowling; *A.*, R. Warren; $7,500.

Four two-story and basement frame, N. side Grove near Laguna. *O.*, G. Middlehoff; *A.*, W. H. Bayless; *C.*, J. Klose; $10,000.

Two-story and basement frame dwelling, S. side Fulton near Van Ness avenue. *O.*, M. Nolan; *A.*, Townsend & Wyneken; *C.*, J. Dougherty; about $4,000.

One-story and basement frame cottage, Lundy Lane between Virginia street and Esmeralda; *O.*, J. J. Willow; *C.*, N. C. Post; $1,200.

Two-story frame on Folsom near Fremont. *O.*, H. Myers; *A.*, Curlett & Eisen; *C.*, W. B. Kreger; $1,400.

Repairs to frame building, S. side Union between Jones near Leavenworth. *O.*, Mr. Kappa; *C.*, J. P. Hansen; $1,000.

Addition and repairs to building, Leavenworth near Union. *O.*, Mrs. M. Kemp; *C.*, S. M. Hills; $1,000.

Repairs to frame dwelling, N. W. corner Washington and Leavenworth. *O.*, J. H. Wise; *C.*, S. M. Hills; $750.

Three-story frame building, Howard street between Beale and Main. *O.*, Risdon Iron Works; *C.*, C. Kinsman; $3,500.

Two-story frame, Illinois street, between Napa and Sierra. *O.* and *B.*, O. W. Hermann; $1,500.

Two-story addition to brick building, N. side Broadway between Dupont and Stockton. *O.*, G. P. Hossatt; *C.*, J. Bonde; $3,500.

One-story and basement frame, N. side Vallejo, between Polk and Van Ness avenue. *O.*, Mr. Lanzendorf; *C.*, F. V. Acker; $1,700.

Three-story frame, corner Filbert and Gough. *O.*, Kranz; days' work; $5,000.

Three one-story and basement frame cottages, corner Fillmore and Moulton. *O.*, Mrs. McCormack; *C.*, G. Barker; $3,000.

One-story and basement frame, S. side Union between Webster and Fillmore. *O.*, Fricke; *A.*, W. Schrof; *C.*, A. Norton; $2,000.

Two-story frame, brick basement, E. side Fillmore between Washington and Jackson; *O.*, J. F. Ortmann; days' work; $4,000.

Two-story frame, corner Steiner and Wildey; *O.* and *B.*, I. E. Alexander; $3,1-0.

Alterations to two-story frame N. side Bush near Octavia. *O.*, C. Hillerbrandt; days' work; $500.

Two-story and basement frame with stable, on S. side Golden Gate avenue, between Laguna and Buchanan; *O.*, Kramer; *A.*, Schmidt & Havens; *C.*, Pluns; $9,-34.

Two-story frame, E. side Fillmore, between Pacific and Broadway; *O.*, G. H. Sanderson; *A.*, H. D. Mitchell; $10,000.

Two-story frame, N. E. corner Geary and Gough; *O.*,— ; *A.*, Schmidt & Havens; *C.*, Mahoney Bros.; $10,000.

Two-story frame, brick basement, S. side O'Farrell, near Laguna; *A.*, J. Goalling; *C.*, McCann & Jeffars; $12,000.

Two-story and basement frame, S. side Ellis, between Buchanan and Laguna; *O.*, Fisher; *A.*, McDougall & Son; *C.*, Sylvester & Langabee; $

Repairs to two-story frame, corner Polk and Ash avenue. *O.*, J. W. Worse; days' work; $1,500.

Two-story frame, Polk street, between Golden Gate avenue and Turk street. *O.* and *B.*, W. Evans; $500.

Repairs to building on Essex street. *O.*, Babcock; *A.*, Cuthbertson; *C.*, Moore Bros.; $700.

E. side Sansome, between Pine and Bush. *O.*, Mrs——; *C.*, Mahoney Bros.; $10,000.

Additions to building, Beale and Fremont streets, near Folsom. *O.*, Whittier, Fuller & Co.; days' work; $4,000.

Repairs to three-story frame, Natoma, near New Montgomery. *O.*, Hagust; *C.*, G. Snyder; $1,900.

Three-story frame tenement, S. side Bu h, between Webster and Fillmore. *O.*, C. L. Taylor; *A.*, Taylor & Copeland; days' work; $6,000.

Additions to two-story frame, N. side Union, near Webster. *O.*, Mrs. Strachan; *C.*, Robinson & Gillespie; $1,300.

Additions and repairs to three-story frame, W. side Taylor, near O'Farrell. *O.*, Mrs. Gunn; *A.*, T. J. Welch; *C.*, P. Lynch; $1,000.

Additions to two-story frame, S. E. corner Larkin and Geary. *O.*, Becker Bros.; *C.*, McGinnis; $800.

Two-story frame, S. E. corner Mission and Twelfth. *O.*, M. Doane; days' work; $2,500.

One-story and basement frame, S. side Clinton Park, between Guerrero and Dolores. *O.*, N. Pierce; *A.*, Townsend & Wyneken; *C.*, Bruce & Gilmore; $1,100.

One-story and basement frame, Lapidge street, between Eighteenth and Nineteenth. *C.*, F. Gonyeau; $900.

Two two-story and basement frame, Hill street, between Valencia and Guerrero. *O.*, S. W. Fuller; *C.*, G. R. Lang; $8,000.

Two-story and basement frame, Twenty-fourth street, near San Jose avenue. *O.* and *B.*, Geo. Edwards; $2,700.

Two-story and basement, frame, Twenty-fourth street, between San Jose avenue and Dolores. *O.* and *B.*, Geo. Edwards; $2,500.

Two-story frame, corner Twenty-third and Howard. *O.*, Mrs. Saul; *A.*, Wright & Sanders; *C.*, R. Doyle; $5,2 0.

One-story and basement frame, N. W. corner Jackson and Octavia. *O.*, Mrs. Delaney; *A.*, W. P. Moore; *C.*, J. L Binet; $5,000.

Two-story frame dwelling, corner Point Lobos avenue and Second avenue. *O.*, P. Donaghy; *A.*, Curlett & Eisen; *C.*, W. P. Clark; $2,500.

Alterations to two-story frame, corner Webster and Jackson. *O.*, E. Allen; *A.*, Curlett & Eisen; *C.*, A. Pare; $1,500.

Two-story and basement frame, on corner Capp and Twenty-first; *O.*, A. M. Jewell; *C.*, H. J. Knapp; $3,700.

One-story frame Folsom near Sixteenth. *O.* and *B.*, John Center; $800.

Two story frame, E. side Tenth between Harrison and Bryant. *O.*, B. F. Gilman; days' work; about $5,000.

One-story frame, W. side Spear near Market. *O.*, Allen, Tuggle & Co.; *C.*, S. M. Hills; $2,000.

Alterations to frame, California near Devisadero. *O.*, Sage; *A.*, W. H. Bayless; days' work, $2,300.

Additions to three-story brick, N. W. corner California and Davis. *O.*, Grangers' Bank Association; *A.*, W. H. Bayless; *C.*, J. Wessinger; $10,300.

Alterations to frame building, Mission street between Eighteenth and Nineteenth. *O.*, J. Hodgboom; *C.*, Sanchez; $2,300.

On the Full Tide of Prosperity.

Such is the fact in California, in all branches of mechanical operations, and especially in connection with house building. The monthly reports of "Building Intelligence," contained in each issue of this journal, clearly illustrates the degree of prosperity attending the building business in San Francisco at the present time, and during the current year; and by comparison, showing a large increase over the preceding year, although 1881 was a year which, in its business results, gladdened the hearts of thousands who had walked under dark clouds during the preceding half decade.

We question whether there is a street—wide or narrow—within the limits of San Francisco, upon the lines of which there are no building improvements under way; while in some cases there are buildings in various stages of progress upon almost every block, from alteration and repair jobs up to fine business structures, expensive residences, and rows of houses for renting.

Consequently there is universal employment for all competent mechanics, in all branches of mechanical pursuits, and the demand for labor is so great that the employment of incompetent men is unavoidable, and the labor of the "scrubs" has to be utilized to the best advantage. Hence an increase of wages rules in all directions. Carpenters are receiving the wages paid ten years ago, ranging from $3 for very common hands to $4 for *good men*. Brick layers' wages for good hands run up to $5 and $5.50 per diem, with limited supply. We have been requested by several master masons to invite the immigration to San Francisco of competent brick layers, with assurances of immediate employment. But we do so cautiously, remembering that some ten or twelve years ago inducements were held out, and unqualified statements promulgated in eastern cities, which caused a rush for California, which flooded the labor market, and resulted in a common injury to the State and to hundreds who came; who, after the great pressure ceased, found it difficult to obtain employment, and were in time reduced to severe straits, many finally leaving the State with no kindly reflections. Still, a moderate increase in present number of brick layers would find ready engagement.

The journeymen plumbers and gas-fitters have united in a society movement for increase of wages, fixing the rates at $4 per day. They have also decided upon the re-organization of the Plumbers' and Gas-fitters' Guards—a result induced by the present most gratifying condition of the building interests generally, and the regular receipt of full week's pay each Saturday evening.

The Carpenters' and Joiners' Union have, in addition to finding employment for all its members, also made a move to reduce the hours of labor on Saturday, fixing the time of quitting work at 4 o'clock.

The lathers—always among the first to exact increase of pay when the *slightest opportunity* offers—have run up the price for lathing fully double on the rates prevailing during preceding years.

We have in former issues this year referred to the bettered state of things existing in California, and stated facts just as they were; but the work of improvement has gone on solidly and steadily, until the demand for labor has absorbed all that there was available, and leaves the market at present unsupplied in part.

The indications all favor a continuance of prosperity, and the masses are made happy by reaping the benefits flowing from an outpouring of gold from the purses of those who have it in abundance. As far as the common comforts of life are concerned, there is at present far greater equality among the people of California as a whole, as none willing to labor need be idle; and when all hands are busy at from fair to excellent wages, want and suffering is eliminated from common life, and the streams of happiness flow gently and sweetly, or roughly and ruggedly, just as each by his own acts shall make them, except when uncontrolable affliction intervenes; and with the rich and wealthy, they can have and enjoy no more of temporal things than just the amount of happiness derived from them; and it is a debatable question whether the *peace, contentment*, and *quiet joys* and *solid comforts* of the humbler home is less *soul-satisfying* than those of palaces and abodes of luxury. We pray God that present prosperities may continue; but that with it, men may cultivate the higher and better sentiments of living, and seek to use and employ the blessings, now being so freely showered upon us as a people, wisely and prudently, rather than recklessly spending all that is received, seemingly defying the future with its possibilities, and forgetting the times that have been, when to obtain employment even at reduced pay was a privilege enjoyed only by a portion of our working classes.

Another Absurd Competition Proposition.

We see noticed in the *American Architect and Building News* a circular that has been issued for plans for school buildings in the city of Brooklyn, New York, which should be treated with the utmost contempt by architects generally. Plans are solicited for one school building to cost fifteen thousand dollars, one to cost twenty thousand, and one, twenty-five thousand. For each, complete working plans are to be provided, showing drainage, provision for heating, etc., with the express stipulation that NO PLAN WILL BE RETURNED. For all this work, the recompense offered is one hundred and fifty dollars, or six-tenths of one per cent. for the twenty-five-thousand building, a little more, our contemporary remarks, than "one-sixth the price which would be paid to an architect of any character for *one* set of drawings." The "prize" for the cheaper buildings—singular to say—is better, but far below a proper sum, amounting to two hundred dollars, or one per cent. for the twenty-thousand building, and two hundred and fifty for the fifteen-thousand building.

Had this proposition originated among the inmates of some lunatic asylum, and been by them promulgated, architects would be prepared to receive the same as one of the freaks of diseased minds, and treated it accordingly. But coming from men controlling the educational interest of the city of Brooklyn, with the appointment of the president of the board of education, the chairman of the school-house committee, the superintendent of public instruction, the superintendent of the buildings of the board of education, and the city building commissioners as a committee to decide the merits of the plans submitted and award the prizes, sets one to thinking and searching for the motive actuating the parties in control. Dishonesty and unfairness are conspiculously evident upon the face of the transaction. If the gentlemen managing the affair flatter themselves they are governed by upright, honest business considerations, they fail to comprehend to what extent they are deceived; for if they know anything about the value of the services called for, they know they are asking labor without the intent to return more than a fractional compensation, which is neither honest nor just; and as they do not make an appeal for gratuitous contribution of plans, for the public good or otherwise, they cannot free themselves from the impurities of intent sustained by their acts. If the purpose is to comply with certain existing municipal requirements which render the advertisement for plans a necessity, they have adopted the most successful method possible of shutting off all honorable competition, as no architect governed by upright and honest professional views and purposes would permit himself to draw a line upon any such understandings as those held out in the circular; and good and fair-minded men being thus excluded from the competitions, the parties *for whose special benefit* the matter is being manipulated will have a clear course, and the dear people will pay the bill—not six-tenths of one per cent., but more likely several times the right and proper charges established by the architectural chapters and associates the world over.

San Francisco Chapter American Institute of Architects.

The regular monthly meeting of the Chapter was held Sept. 1st, in the rooms of the Art Association. The number present and the interest manifested were especially gratifying to those who attended.

The report of the committee upon the awarding of the premiums for the competitive designs for the CALIFORNIA ARCHITECT AND BUILDING NEWS was received. The committee were granted till the next regular meeting to make their decision for the purpose of correcting an apparent error in printed report.

L. Goodrich of San Jose was elected a Fellow member; W. G. Matthews of Oakland was proposed as a member.

A beautifully bound volume of the Constitution and By Laws was presented to the Chapter by its President, John Wright, Esq. A vote of thanks, preceded by a brief speech, was

tendered to the President for his generous gift, which was unanimously adopted by a rising vote.

Messrs. Sanders, J. E. Wolfe, and Laver were appointed a committee to investigate the matter of establishing classes for the tuition of articled students in the profession.

A spirited contest then took place for the election of officers for the ensuing term, the result of which is as follows: President, John Wright; Vice-President, William Curlett; Recording Secretary, Geo. H. Wolfe; Corresponding Secretary, Theo. A. Eisen; Treasurer, W. P. Moore; Executive Committee, S. Babson, T. J. Welch, G. H. Sanders; Trustees, A. Laver, B. E. Henriksen, J. Gash.

George H. Wolfe, William Curlett, and W. P. Moore were appointed as a committee to arrange for a lecture to be delivered at the next meeting.

J. E. Wolfe and George H. Sanders were appointed a committee to co-operate with the corresponding secretary to prepare an address to be delivered before the American Institute at their next convention, which is to be held in the city of Cincinnati, October 25th and 26th, 1882.

The Mechanics' Fair, San Francisco, 1882.

The tens of thousands of patrons who have enjoyed the pleasure of attending the Seventeenth Industrial Exhibition of the Mechanics' Institute of San Francisco will cheerfully bear testimony to its more than usual excellence. The present Fair building is considerably smaller than the structure occupied during the past six or eight years for exhibition purposes, but what it lacks in relative area is fully compensated by improved arrangements and conveniences; and its greater neatness of finishes, and the liberal application of white paint, gives it an air of cheerfulness which has not existed in any of the former Fair buildings. The general exterior appearance is of fair architectural merit, considering the fact that it is a frame edifice erected to serve the purposes of perhaps the next ensueing decade, by which time, or at an earlier date, a permanent brick building is likely to be erected, covering the entire block, which contains six fifty vara lots, or an area of 113,437' 6". This space properly utilized, with all the advantages possible of application introduced, a permanent building may be constructed, which will stand for generations as a monument to the wisdom and intelligence of those who shall direct its consummation, provided wisdom, intelligence, and unselfishness of purposes shall control the acts of those who may participate and direct the planning and construction of what should be a model edifice. For the Institute membership being almost exclusively composed of men engaged in the mechanical and constructive arts and sciences: workers in all manners of woods, metals, stones; material composites of every class and kind; architects, designers, inventors, etc., there *should be* no failure in the noble work of rearing a magnificent structure for permanent use, from the dome, towers, and turrets of which the loved ensign of freedom and the banners of the mechanical industries of our State shall float more beautifully, as with seeming inanimate pride at the honor of waving over an edifice architecturally faultless, in arrangements perfect, and in conveniences, safety, and comfort, complete in every detail.

To accomplish all this, however, will require the services of men uncontrolled and *uncontaminated* by a single sentiment of personal ends and purposes, and of large intelligence and clean hands. Such men the Institute has always had within its membership, and among its managing representatives, and it is fair to presume that time will increase rather than diminish the moral elements which have hitherto made the Mechanics' Institute of San Francisco and its numerous exhibitions great successes.

We cannot enter into a detailed notice of all that is to be seen on exhibition, nor is it necessary to do so, as the daily press has regularly presented the general facts of interest occurring or to be seen, so that our Pacific Coast readers have had served to them all that we could say, and perhaps in better shape, leaving it for us simply to add indorsement to the numerous favorable notices which have been published from day to day.

As pertinent to the interests represented in this journal, we refer specially to the exhibit of paints, oils, varnishes, etc, by the house of Whitter, Fuller & Co., who have never failed to assume a leading position in their line at each successive exhibition, while the business intelligence and integrity of the firm have won for it an enviable reputation wherever the Pacific Coast trade in paints, oils, and painters materials extends. This firm deserve special mention, in view of the fact that they have established in San Francisco a white lead manufactory, which produces an article as good as the best produced anywhere. These works, together with the manufacture of mirrors, etc., give employment to hundreds of workmen, and daily support to numerous families; and in addition to the manufacturing forces, a large corps of employees are engaged as office, receiving, and delivery clerks, porters, teamsters, and helpers generally.

John Mallon, as usual, makes a large display of cut and ornamental glass for house, church, steamboat, and all other purposes. Mr. Mallon, we believe, is the pioneer worker in his art, and deserves well of all who need anything in his line, and desire artistic workmanship and honest dealings. We speak from a twenty years' experience with John.

W. W. Montague & Co. are on hand as usual, with a magnificent display of ranges, stoves, and all the numerons devices so necessary in the proper preparation of food for the table. We once had in our employ an intelligent old gentleman—so by nature, although preferring the duties of the kitchen as cook, to much higher positions for which he was by education fully qualified, who often remarked, "The good Lord sends us good provisions, and the Devil sends cooks to spoil them." The cook who could not prepare "delicious dishes" with the facilities presented by the house named must be one of that kind, whose credentials bear the date and authority by the fiend who is said to perambulate the universe of mankind seeking whom he may devour; if by no other means, then by the hands of the provision spoiler, the "miserable cook."

This firm also makes a fine display of iron mantles, tiling, and other things necessary in the completion of a well-appointed home or other building, in which due regard to æsthetics in interior finishes are observed. The question is often asked architects, Are those iron mantles serviceable? To which the proper answer is, They are, and will maintain their original appearance and conditions better than any other class of mantles.

Saws, saws, saws, innumerable. The display of saws by the Pacific Saw Manufacturing Company forms one of the most beautiful and interesting exhibits in the Fair. We notice this firm with special pleasure, as they have brought the manufacture of saws in San Francisco to a degree of perfection which challenges the world in competition, from the heavier circular, mill, hand, band, and other large saws, down to the finest and most delicately toothed blade, not excepting that class of saw instruments by which the injured, broken, and diseased limbs of mankind are sawed asunder, and that less dreaded kind which saws apart the carcasses from which the family table is supplied with "fine roasts" and tender steaks.

There is also on exhibition samples of *Asphaltum Paving Blocks*, by a New York company. We make reference to these in view of the fact that these blocks are a California invention, patented by a San Franciscan named Skinner, who, with imperfect presses and other disadvantages, failed to do more than produce in form and shape what the New York Company is now doing, if their testimonials and authenticated circulars are to be relied upon, with the utmost success. They are said to be equal almost to iron as to durability, while in numerous other particulars they are credited with qualities and properties far superior to any other material used for street or sidewalk and other purposes. It is stated that the demand for the blocks is greater than the present facilities of manufacture, which produces hundreds of thousands monthly. We regret that circumstances prevented the realization of this greater success in San Francisco.

Another item of interest is the California Wire Works display, in which, among the many interesting and beautiful things exhibited, is that of a sixteen-inch wire cable, 125 feet long, weighs 23 lbs. to the foot, is comprised of 43 miles of No. 12 wire, and capable of resisting a tension of 180 tons.

Latson & Co., hardware dealers, have on exhibition a very fine sample cabinet of bronze and other high-cost hardware.

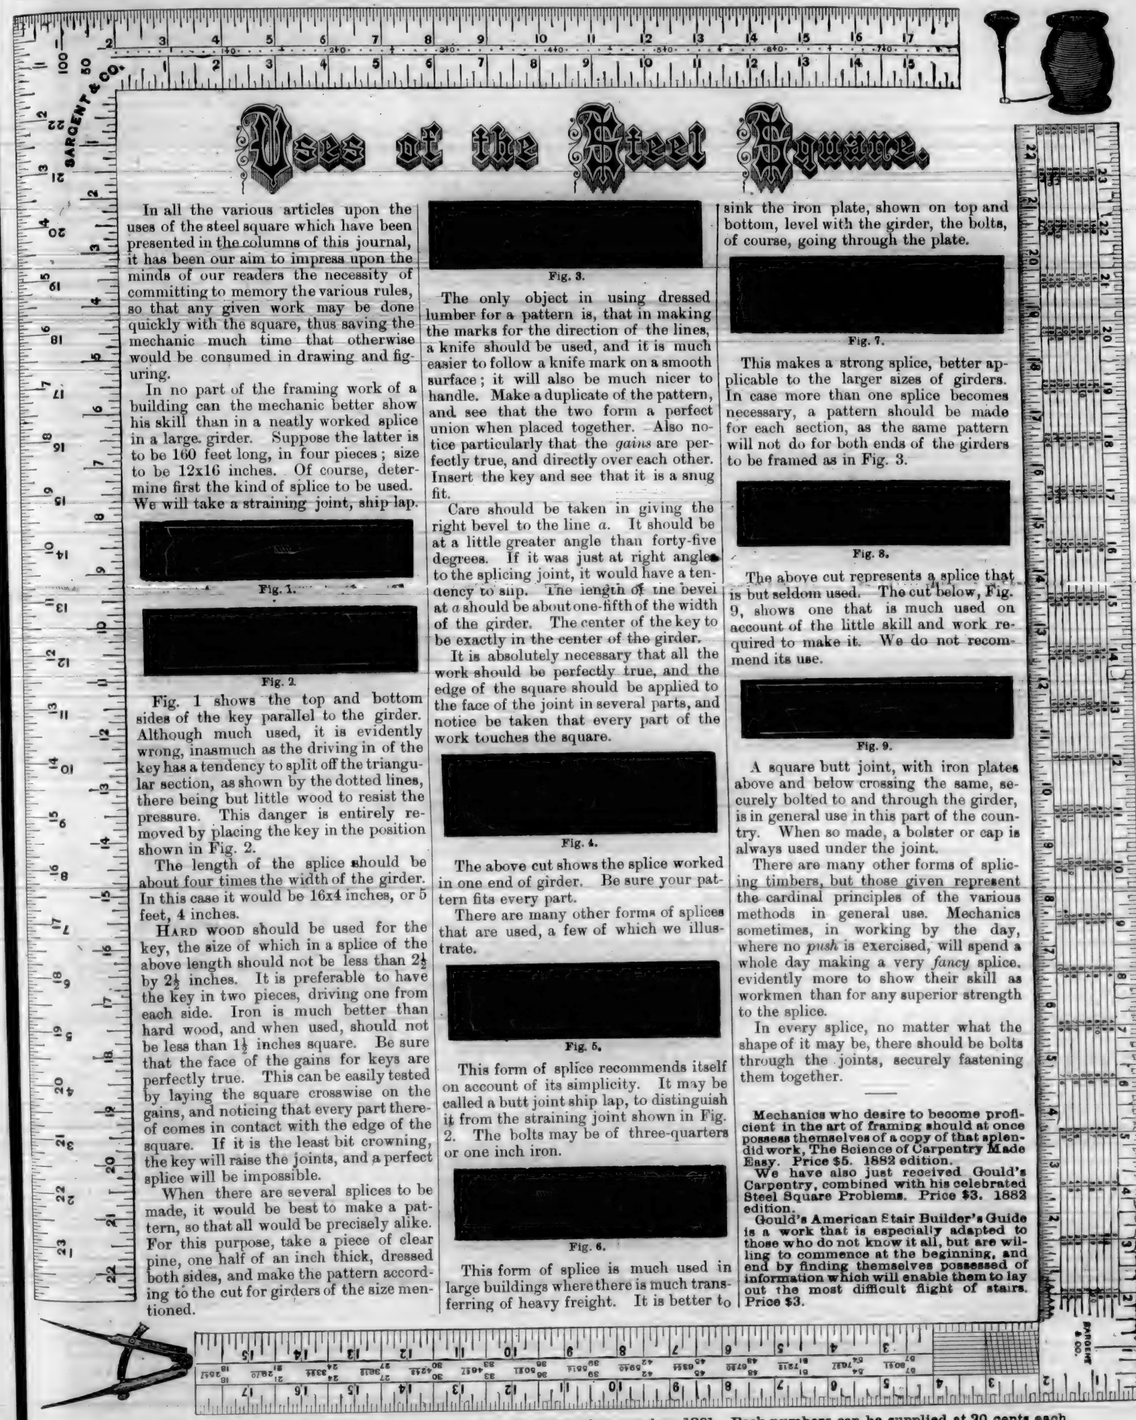
An Unjust Critic.

We notice that a would-be wonderfully wise man has arisen in the Eastern States in judgment upon the architecture and architects of the present times, who asserts, in effect, that where architects most abound, the science is the least honored; and in support of his position, selects certain churches as examples, and deals with them as monstrosities in certain particulars.

The gentleman is, in a general sense, by no means an ignoramus, but he indulges in statements of decidedly hypothetical character, and says more than facts justify. Sweeping conclusions, sustained only by isolated illustrations, are both unkind and unfair, and we wonder that intelligent men should so often be led astray by permitting themselves to be governed by the exceptions, rather than reviewing matters in a broader and more general sense, giving credit where credit is due; while they pour the venom of their dissent and condemnation upon objects and things which may deserve rebuke.

To assert that even a majority of the thousands of learned and intelligent men who have made architecture a study have in the main failed to develop the beauties of the science, and that there exists but little to their credit, is an exhibition of asperities far too common among men who claim to be governed by right motives. Such things are not to be wondered at in the vulgar-minded, but come with ill grace from those who have had the advantages of education and the surroundings of social refinement.

That architects sometimes fail to do themselves full justice, and err in their conceptions and delineations, must be admitted. But even in this, the profession is at no special disadvantage, any more than the medical profession is to be condemned because physicians sometimes expedite the transition of mortals from earth to the realms where departed spirits dwell; nor the legal fraternity, because lawyers sometimes lose cases which might have been won by greater diligence and wiser management. Hence, all criticisms controlled by a fixedness of purpose to reveal and expose all the bad that can be found, and conceal or reject the good, shows a lack of that magnanimity which should in all cases govern the written or oral utterances of those who arrogate to themselves the privilege of expressing personal opinions upon the productions or acts of others.



Uses of the Steel Square.

In all the various articles upon the uses of the steel square which have been presented in the columns of this journal, it has been our aim to impress upon the minds of our readers the necessity of committing to memory the various rules, so that any given work may be done quickly with the square, thus saving the mechanic much time that otherwise would be consumed in drawing and figuring.

In no part of the framing work of a building can the mechanic better show his skill than in a neatly worked splice in a large girder. Suppose the latter is to be 160 feet long, in four pieces; size to be 12x16 inches. Of course, determine first the kind of splice to be used. We will take a straining joint, ship lap.

Fig. 1.

Fig. 2

Fig. 1 shows the top and bottom sides of the key parallel to the girder. Although much used, it is evidently wrong, inasmuch as the driving in of the key has a tendency to split off the triangular section, as shown by the dotted lines, there being but little wood to resist the pressure. This danger is entirely removed by placing the key in the position shown in Fig. 2.

The length of the splice should be about four times the width of the girder. In this case it would be 16x4 inches, or 5 feet, 4 inches.

HARD WOOD should be used for the key, the size of which in a splice of the above length should not be less than 2½ by 2½ inches. It is preferable to have the key in two pieces, driving one from each side. Iron is much better than hard wood, and when used, should not be less than 1½ inches square. Be sure that the face of the gains for keys are perfectly true. This can be easily tested by laying the square crosswise on the gains, and noticing that every part thereof comes in contact with the edge of the square. If it is the least bit crowning, the key will raise the joints, and a perfect splice will be impossible.

When there are several splices to be made, it would be best to make a pattern, so that all would be precisely alike. For this purpose, take a piece of clear pine, one half of an inch thick, dressed both sides, and make the pattern according to the cut for girders of the size mentioned.

Fig. 3.

The only object in using dressed lumber for a pattern is, that in making the marks for the direction of the lines, a knife should be used, and it is much easier to follow a knife mark on a smooth surface; it will also be much nicer to handle. Make a duplicate of the pattern, and see that the two form a perfect union when placed together. Also notice particularly that the *gains* are perfectly true, and directly over each other. Insert the key and see that it is a snug fit.

Care should be taken in giving the right bevel to the line *a*. It should be at a little greater angle than forty-five degrees. If it was just at right angles to the splicing joint, it would have a tendency to slip. The length of the bevel at *a* should be about one-fifth of the width of the girder. The center of the key to be exactly in the center of the girder.

It is absolutely necessary that all the work should be perfectly true, and the edge of the square should be applied to the face of the joint in several parts, and notice be taken that every part of the work touches the square.

Fig. 4.

The above cut shows the splice worked in one end of girder. Be sure your pattern fits every part.

There are many other forms of splices that are used, a few of which we illustrate.

Fig. 5.

This form of splice recommends itself on account of its simplicity. It may be called a butt joint ship lap, to distinguish it from the straining joint shown in Fig. 2. The bolts may be of three-quarters or one inch iron.

Fig. 6.

This form of splice is much used in large buildings where there is much transferring of heavy freight. It is better to sink the iron plate, shown on top and bottom, level with the girder, the bolts, of course, going through the plate.

Fig. 7.

This makes a strong splice, better applicable to the larger sizes of girders. In case more than one splice becomes necessary, a pattern should be made for each section, as the same pattern will not do for both ends of the girders to be framed as in Fig. 3.

Fig. 8.

The above cut represents a splice that is but seldom used. The cut below, Fig. 9, shows one that is much used on account of the little skill and work required to make it. We do not recommend its use.

Fig. 9.

A square butt joint, with iron plates above and below crossing the same, securely bolted to and through the girder, is in general use in this part of the country. When so made, a bolster or cap is always used under the joint.

There are many other forms of splicing timbers, but those given represent the cardinal principles of the various methods in general use. Mechanics sometimes, in working by the day, where no *push* is exercised, will spend a whole day making a very *fancy* splice, evidently more to show their skill as workmen than for any superior strength to the splice.

In every splice, no matter what the shape of it may be, there should be bolts through the joints, securely fastening them together.

Mechanics who desire to become proficient in the art of framing should at once possess themselves of a copy of that splendid work, The Science of Carpentry Made Easy. Price $5. 1882 edition.

We have also just received Gould's Carpentry, combined with his celebrated Steel Square Problems. Price $3. 1882 edition.

Gould's American Stair Builder's Guide is a work that is especially adapted to those who do not know it all, but are willing to commence at the beginning, and end by finding themselves possessed of information which will enable them to lay out the most difficult flight of stairs. Price $3.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

Dwelling-House Sanitation.—III.

BY GLENN BROWN.

"Pure air, pure water, and a pure soil."—HIPPOCRATES.

Concerning the size of soil and drain pipes, the best authorities all agree that they should be as small as possible consistent with their properly carrying off the solid and fluid matter which comes into them. Small pipes are thoroughly flushed and washed, and are kept clean more easily by the water discharged through them than if they were large. It has been discovered that large pipes fill with slime and sediment, only allowing sufficient room for the regular amount of water that passes through them, thus really destroying all that is supposed to be gained by the large pipes. In small pipes this storage of filth is avoided. Mr. George E. Waring says on this subject: "It is the decomposition of such material in soil-pipes and sewers alone that we are to find the seat of the enemy of which we hear so much under the name of sewer-gas. . . . There is no safety in sewerage or in house drainage, until the production of these gases is stopped; and there is no manner of accomplishing this short of the entire cleanliness of every pipe-drain and sewer which serves for the removal of foul organic matter. . . . The belief is general that if a given amount of sewage can be discharged through a small pipe, it can surely be discharged through a large one; that is not true, for reasons given before." Thus by having small pipes we keep out of the house itself a large amount of decomposing matter, which would accumulate in the large soil and drain pipes, and we have less impure gas to carry off by ventilation. Except in houses that are unusually large, the soil and drain pipes should not exceed four inches in diameter. This has been found to be the best size for pipes that are to be used inside for house drainage. (Fig. 1, A and B.)

In the proper ventilation of soil and drain pipes, water-closets, and traps, we find the only way of excluding sewer-gas from our homes. Proper ventilation carries off all gases which may be generated in the different parts of the plumbing system, and it also takes off any gas which may get into the house drains from the sewer. This gas is supposed to be excluded from the house drains by the double running trap. (Fig. 1, C C.)

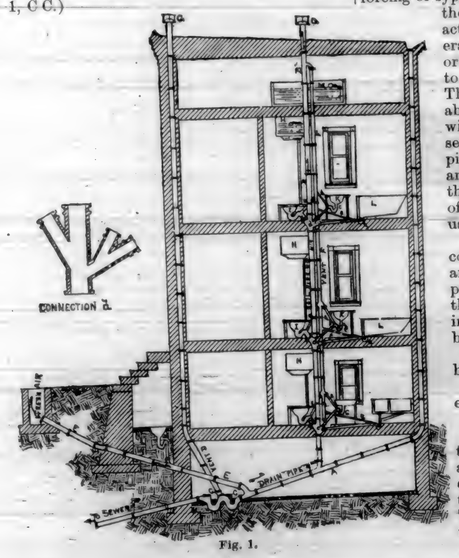


Fig. 1.

By referring to Fig. 1, the following description of the best sanitary arrangement of plumbing fixtures will be readily understood:

A B, the soil-pipe, four inches in diameter, running through the roof, full size, and capped with an Emerson's ventilator; so no matter in what direction the wind may blow, it assists in creating a current of air through the pipes in the direction indicated on the cut by the arrows.

A, the drain-pipe, running along the cellar wall, and attached thereto by iron brackets, with a double running trap (C C), just before leaving the house. This drain should always be put above the cellar floor, so that any defect may be readily noted and properly attended to. The cellar floor should have its surface drain towards the running trap (C), where a screw tap, water and gas tight, should be placed, so the trap may be opened easily in case of necessity. E is the outlet to the street connecting with the drain-pipe inside the running trap (C). By this inlet to the drains, or outlet from the house system, fresh pure air is supplied to the whole system of soil and drain pipes inside the house. The heat in the house during nine months of the year would cause a draft from the street through the pipes E A B through the roof to the outside of the house, in the direction shown on the drawing by arrows. In the warm months wind blowing in any direction would tend to produce the same result by its actions on the Emerson's ventilator, and also by the heat produced on the roof of the house being greater than the heat at the inlet on the pavement. The pipe E also acts as an outlet for the column of air which is forced downward by the discharge of the water-closets in the upper stories, which would otherwise force the traps in the water-closets, wash-basin, bath-tubs, etc., in the lower stories of the house, thus allowing free access to sewer-gas into all the rooms.

D, the pipe running from its connection between the double running trap (C C), above the roof. This pipe is put in, in case gas from the sewer should, by back pressure, force the first trap to allow the gas to escape without forcing the second part of the trap, and entering the house portion of the plumbing system.

F, the large vent-pipe with which the small vent-pipes (*e e e*) from the traps of water-closet, wash-basins, etc., connect. This vent prevents forcing or syphonage of the traps; in either case the trap would be emptied. It also acts as a duct through which gas generated in the traps or branch pipes, or any gas which may find its way into these branches, will find egress. This pipe (F) must join the soil-pipe above the point where it is connected with a branch drain-pipe, or continue separately through the roof. Drain-pipes must be kept free from deposit; and where this cannot be effected by the flushing from water-closets, one of Roger Field's flush tanks should be used.

d, the proper fitting to employ in connecting water-closets, wash-basins, and bath-tubs with the soil-pipe; the practice of running the waste from the wash-basin or bath-tub directly into the water-closet trap should never be allowed.

C C, the traps to water-closets, wash-basins, and bath-tubs.

H, the tank for flushing water-closets, drain and soil pipes.

I, the water-closets.

According to the present light upon the subject, the above arrangements are the best that can be adopted to exclude sewer-gas, provided we select the proper water-closets and traps. The kind of water-closets and traps to use will be treated of farther on in this article. Where it is necessary to make the plumbing cheaper than described above, we must first discard one running trap (Fig. 1, C) at the point where the drain leaves the house; and the vent pipe D, which goes to the roof as an outlet for gas in the case of back pressure, next the vents to traps (C C C), may be left out, provided the fixtures are placed close to the soil-pipe that runs through the roof; but this is not advisable. In the cheapest plumbing work the following points should be insisted upon: soil-pipe (B) running through the roof full size, the drain pipe (A) being kept above the cellar floor, the fresh air inlet (E), and one running trap (C).

All water-closets, wash-basins, bath-tubs, sinks, etc., must have separate traps, and no part of the plumbing must be concealed behind the plastering, but so arranged that it may be readily inspected. There are several things which are often done in the plumbing of a house that need to be carefully avoided. The overflow pipe, or tell-tale, from the tanks should never have an entrance into the soil-pipe, as, the trap on it being rarely used, the water in the trap would evaporate, and the gas would be absorbed by the water in the tank. The wastes from our refrigerators should never be run into the soil or drain pipe, as thus our food is liable to become tainted and unhealthy. Overflow pipes had better empty into the kitchen sink, where they will be readily seen, and where there will be no possibility of their conducting the gas into either our water or edibles.

Unless the water supply is ample, there should be a tank into which the water will rise slowly, or may be pumped. This tank is to supply all the water except for drinking and eating purposes, and must be properly covered to keep out impurities. The water for drinking must be brought directly from the street main.

There is considerable difference of opinion as to the best kind of closet to be used. The patents and patterns are numerous, and their number is constantly increasing. They are found in the market manufactured of iron, plain, painted, and enameled, and of porcelain, the latter material being the best, but the most costly. These patterns may, for convenience, be divided into four classes: the hopper (Fig. 2); pan closet, which is most commonly used at the present time (Fig. 3); the plunger closet; and valve closet (Figs. 4 and 5); the two last named being often called the improved water-closet. Hopper closets are now manufactured short and long. The best sanitarians agree that the plain short hopper closet (Fig. 2), when well trapped and ventilated, and having a supply of about two gallons of water from a tank to properly flush the bowl, is the best arrangement in the market for a water-closet. By referring to Fig. 2, it will be seen that the bowl (*a*) connects directly with the trap (*d*).

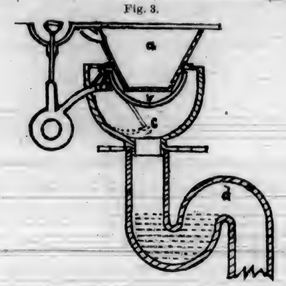
Fig 2

HOPPER CLOSET.

After reading a description of the other closets, and seeing their defects, the reason why this simple closet is the best will be obvious.

Fig. 3 shows the pan closet which has been in almost universal use in this country; *a* is the bowl; *b* the pan; *c* the cesspool, as it has been aptly called; and *d* is the trap by which it connects with the soil-pipe. It has been found in practice that the chamber (*c*) accumulates a large amount of filthy matter, which is in a constant state of putrefaction, giving off its deleterious gas, or acting as a medium for the conveyance of

Fig. 3.



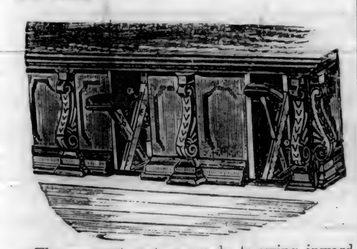
PAN CLOSET.

causative germs. The supposed water seal in the pan is so slight that it readily evaporates, and we get a supply of these organic germs every time the pan is opened. The manner in which the bowl (*a*) is set on the cesspool (*c*), bedded in putty, makes it at any time liable to become loosened, and when this occurs there would be a constant supply of sewer-gas from the chamber (*c*). It is impossible to get at this portion (*c*) of a pan closet to clean it with soap and water without taking the whole thing to pieces, and this can only be done by a practical plumber at considerable cost. In fact, it is out of sight and out of mind. A very small proportion of the people who use them know there is such a part to the closet as the cesspool (*c*).

(To be continued.)

Automatic Folding Seat for Counters, Tables, etc.

The inventor claims for this device extreme simplicity, practicability, and cheapness. The seat is properly secured upon the end of a long lever whose lower end is pivoted under the counter or table so as to swing out therefrom far enough to bring the seat to a proper level, when its further movement is arrested, and the seat supported by means of a stop upon two diagonal guide bars between which the swinging arm moves.



The arm and seat are made to swing inward automatically by means of a counterbalancing weight upon a cord which is attached to the seat lever, and passes therefrom over a pulley under the counter or table. When the seat is drawn outward for use, the weight is elevated and upheld by the weight of the person seated. So soon as the person rises, the seat is automatically raised thereby, and folded in out of the way. The seat may be readily made single or double, of any desired material or style, and be adapted to a great variety of conditions and combinations, and to all positions where a folding seat is desirable.—*Industrial Review.*

It has been suggested that the wire fences which bound a multitude of western farms might be turned into telephone connections of small cost, to the social advantage, if no other, of the occupants of farm-houses.

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

[While this column is open to all, farmers as well as mechanics, engineers as well as architects, we would call particular attention to one and all to have their questions and the information desired to be in accord, as far as possible, with the interests of this journal and for the carrying out of those principles for which the only monthly of its kind this side of the continent, was established. We will endeavor to answer all questions in a fair and impartial manner, and if it becomes necessary, will furnish cuts for the illustrations of any problem, provided we regard the solution thereof as beneficial to the majority of our readers. We would urge upon our patrons the necessity of being pointed in their questions, concise in the language used; let the writing be distinct, and one side of the paper only to be used; give full name and address, and particularly mention if their proper name shall be used.

We want it distinctly understood that the responsibility of signed articles rests with the authors.

Correspondents will please direct all communications to the business manager of this journal—240 Montgomery street, rooms 12 and 13.]

EDITOR ARCHITECT: How can I tell good brushes for a draughtsman's use?

K. L., Oakland.

ANS. Dip the brush into clean water, and holding it vertically, shake out the water; if the brush is well made, the hair should come naturally to a nice even point. The swell in the side of the brush should not be too abrupt.

The following tables will be found of much benefit to parties residing in the country, who desire to know the weight of doors, sashes, blinds, etc., so as to form a basis for railroad expenses:

WEIGHTS OF DOORS.

	1 Inch.	1¼ Inch.	1½ Inch.
2 ft. 0 in. x 6 ft. 0 in.	20 Lbs.	25 Lbs.	32 Lbs.
2 " 6 " x 6 " 6 "	27 "	33 "	38 "
2 " 8 " x 6 " 8 "	.....	35 "	40 "
3 " 10 " x 6 " 10 "	.....	.....	48 "
3 " 0 " x 7 " 0 "	.....	.....	50 "

WEIGHTS OF WINDOWS.

	1¼ Inch.	Glazed.	Unglazed.

FRIEND ARCHITECT: Will you kindly furnish me the formula for making *plumbers' black or soil?* I do not want to infringe upon "*shop secrets*"; but a knowledge of the above composition will greatly oblige an AMATEUR.

ANS. It is composed of glue and lamp-black dissolved in water. The proper proportions of glue and lamp-black to use in making the soil may be determined by actual experiment. If the soil adheres well to the pipe and is not easily rubbed off by the finger, it may be considered right. On the other hand, if it can be easily rubbed off, it is evident that a little more glue is required. We do not know that any special directions are necessary to give with reference to making the soil, beyond what is presented above. Plumbers' soil is quite a curiosity to a tinner. A tinner or galvanized-iron worker applies acid to the edges of his metal in order to cause the solder to adhere. A plumber applies soil to such portions of his pipe with which solder is likely to come in contact to which he does not wish solder to adhere. Accordingly, the plumber's use of soil is directly opposite to the tinner's use of acid or rosin. Soil in its general appearance is black, and in consistency is about the same as common molasses.

Tin Roofs.

A tin roof properly put on and kept properly painted will last about 30 years. A tin roof ought not to be painted for the first time until it has been on about 30 days, so as to get the grease off the tin, and all the rosin should be carefully scraped off.

It is sometimes necessary, on buildings where there is much dampness or steam, as stables, blacksmith shops, round-houses, etc., to paint the tin one coat on the under side before laying. After the roof has been painted the first coat, it should be painted again in about a year, and after that, once in three years is enough.

There are two kinds of tin: one, the coating of which is all tin—that is, the tin proper, sometimes called "bright tin"; the other, the coating of which is a composition, part tin and part lead; this is called "tern," "leaded," or "roofing" tin. This last is a little cheaper than the "bright," and will not rust any quicker, but we think, as do many others, that the sulphur in our soft-coal smoke eats through the "leaded" coating sooner than through the "tinned."

Of tin there are two sizes, 10″x14″ and 14″x 20″, and two grades as to thickness, IC the light, and IX the heavy.

For a steep roof, one-sixth pitch or over, the IC, 14″x20″ tin ("leaded," if high up where little smoke will get to it; "bright," if low down where much smoke will get to it), put on with a standing groove, and with the cross seams put together with a double lock, makes as good a roof as can be made.

For flat roofs, the best roof is made with the IX, 10″x14″, "bright" tin, laid with cleats; but the others make good roofs, and any of them will last for 25 years at least.

All tin roofs should be laid with cleats, and not by driving the nails through the tin itself.

A Philadelphia paper notes the use of wood joists in the construction of a fire-proof building in that city, on Walnut Street, above Fourth. It says that, strange as such a statement may appear, it is a matter of fact that many New England builders contend that the wood joists, encased in plaster, are proof against any ordinary fire, and for many reasons are much preferred by them to the ordinary regulation fire-proof iron joists. The joists are "stripped" on the outside, and over these strips irons are run, and on these the plaster is spread. The theory is, that in an ordinary fire these joists thus treated will be fireproof, and only when the fire has reached such a fury that the building must go anyway will they be affected. Here comes in one of the advantages claimed for them. When a building is being burned by a furious fire the iron joists expand and crush out the walls and do other damage. The wood joists would simply be burned up without injuring the walls at all.

A Boston novelty is a glass veneer, which is said to be meeting with a good deal of favor.

PLATE 1.—ELEVATION OF COUNTRY RESIDENCE.

Our Illustrations.

Plate 1 represents the elevation of a very convenient and commodious country residence, now in process of erection at Martinez, Plates 2 and 3 being the ground plan of the same. The cost will be about $9,500.

Plate 4 is the elevation of a suburban villa taken from Lakey's Village and Country Homes, Plates 5 and 6 being the ground plans of same. We are making arrangements, shortly to be completed, to make the cuts in this journal equal to those of any periodical published in the United States.

The introduction of electric lights seems to have brought about an increased consumption of gas, the contrast between the electric light and the ordinary gas light creating a demand for more powerful burners.

Practical Lessons in Architectural Drawing.

The scheme adopted in this work is to select more or less simple examples in the several classes of construction—frame, brick, and stone—and by carefully working out the drawings in the order in which they are required in actual building, and by explanations in the adjoining text, to put the work in such shape that it can be readily understood and comprehended. The examples have been given a varied character, in order that as many different ideas as possible may be illustrated. The last chapter deals with the coloring of architectural working drawings, and is illustrated by a plate in colors. Sent post-paid to any address, upon receipt of the publisher's price, $2.50.

Though a strong man, the carpenter cannot raise his frame without assistance.

Work Manuals.

The following are the titles of the volumes already received :

I. CEMENTS AND GLUES.
II. THE SLIDE RULE, AND HOW TO USE IT.
III. HINTS FOR PAINTERS, DECORATORS, AND PAPER HANGERS.
IV. CONSTRUCTION, USE, AND CARE OF DRAWING INSTRUMENTS.
V. PROBLEMS IN CARPENTRY AND JOINERY SOLVED BY THE AID OF THE STEEL SQUARE.

Upon receipt of twenty-five cents in postage-stamps, we will mail either of the above-named to any address.

In the beginning of the last century it was suggested to the mind of a Frenchman to use wood for the manufacture of paper, by observing that the nests of wasps were made of this material.

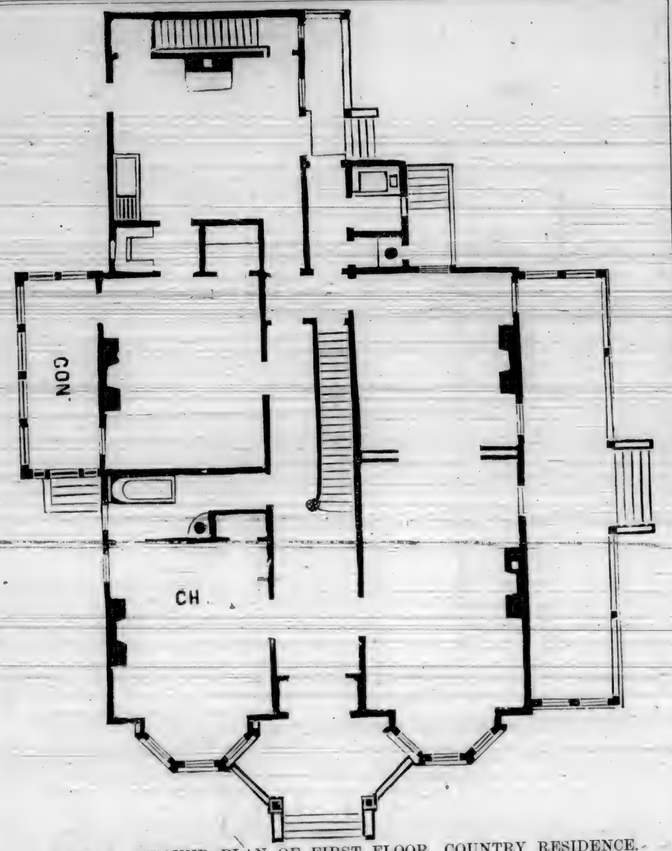

PLATE 2.—GROUND PLAN OF FIRST FLOOR, COUNTRY RESIDENCE.

Revised Work on Carpentry.

We have just received an invoice of GOULD'S CARPENTRY, combined with his STEEL SQUARE PROBLEMS. Every carpenter and mechanic should possess a copy, as the low price ($3) places it within the reach of all.

Also, by the same author, the AMERICAN STAIR BUILDER'S GUIDE. A very useful work to all mechanics. Price $3.

Ourselves.

Scarcely a day passes in which we do not receive, by letter and personally, additional proof, at home and from abroad, of the great popularity and enviable reputation attained by this journal, in addition to the numerous favorable notice which appear in California and Eastern contemporaries, following each monthly issue.

While this very naturally affords us pleasure, it also reaches far beyond and higher than any mere sentiment of vanity, and invites and inspires to more advanced purposes and determinations to improve and make grandly successful the little waif which was launched into existence as a quarterly in 1879, when dark and gloomy clouds hung over all interests in California, and the life's blood of enterprise and prosperity had coagulated in the veins of business life, and the voice of discouragement and despondency was heard on every hand.

But it has surmounted all obstacles, and today is known and recognized throughout the entire expanse of our own great country, and to a considerable extent in foreign lands, as a "well-conducted, ably managed journal." The *Alameda Encinal* thus speaks of us :

"The *California Architect and Building News*. . . . We have several times referred to this journal in terms of praise, feeling confident it deserves every good word we could say of it. The *Architect*, as it is familiarly called, is sound in all its departments. It is carefully and judiciously edited, always truthful, clear, and unbiased in its statements. Aside from its special interests to builders, and those contemplating improvements, it is a journal for the home circle, being both pleasing and edifying."

We had about *one thousand* clips of notices of the foregoing character which some soulless creature stole from us; soulless—because he who would rob an editor of his portfolio does not contain within the skin that covers his vile carcass enough of manly virtue and integrity to entitle him to equal considerations that would be accorded to a dog with character sufficient to induce his master to provide a license-tag for his neck to save him from the lariat of the merciless pound-master.

Wonders of Simple Tools.

A complicated engine, like the common wood-worker, the printing-press, a compound lathe, or various forms of spinning and weaving machines, is really one of the most wonderful things in the world. Most of such contrivances are the product of the combined thought, study, experience, and ingenuity of generations and ages; yet some of the simplest tools, either in their construction or use, represent a degree of ingenuity and manual skill which is astonishing. A common file is one of the simplest of tools to look at, and to a careless view one of the easiest to make. Files have been in use from the beginning, and rank with the hatchet and hammer in simplicity and usefulness. From the time the naked savage smoothed his arrow head with a bit of sharp, gritted stone, and the handle of his club with a piece of dried fish skin, to these days of finely finished work, the race of man has employed some form of file to accomplish mechanical results. Yet the making of the hardened steel file which is now so universal requires a delicacy of touch and exactness of movement that is wonderful. The diagonal cut upon the sides of a common "three-cornered" file appear to the eye to be absolutely regular, uniform in their relative distance, and alike in depth; the keenest vision is unable to detect any irregularity, and their cutting seems to be the work of a delicate and accurate machine. A close scrutiny also shows that the cuts grow finer, closer, and shallower, by almost imperceptible degrees of variation, as they approach the tapering point. Upon the smaller files of the regular sizes there are more than two hundred of these parallel cuts to the inch, and in some of delicate make, for special purposes, this degree of fineness is greatly exceeded. Yet this wondrously delicate and accurate work is done, not by the aid of machines with minute micrometer screws and gauges, but with a simple hammer and chisel in the workman's hand. The advance of the chisel upon the blank at each cut of the two hundred and fiftieth part of an inch, neither more or less, is regulated simply by the unaided sense of touch. The weight of the blow, also diminishing or increasing at each stroke by a fraction of an ounce as the cutting approaches or recedes from the point, is regulated solely by the judgment of the workman. All this is done without pause or hesitation to correct or re-adjust, and with a rapidity which shows itself in the cheapness of the finished file. File-cutting is rendered still more delicate and difficult by the varying hardness of the same bit of steel at different points in its surface, which would cause blows of equal force to make cuts of varying depth and width. This unequal hardness must be perceived as the cutting progresses, and allowance must be made for it all through the operation. Doubtless all this seems easy enough to the practiced file-cutter, and he does his work without even thinking of these difficulties. Yet the education of hand, nerve, and brain to such a perfection of movement is certainly a most wonderful illustration of perfectfon attained in the use of tools. For more than one hundred years efforts have been made to cut files by machinery, with only partial and moderate success, the process, simple as it appears, being too delicate for less perfect instruments than the human hand and brain.—*Builder and Wood-worker.*

PRACTICAL LESSONS
—IN—
ARCHITECTURAL DRAWING,
PRICE, POST-PAID, $2.50.

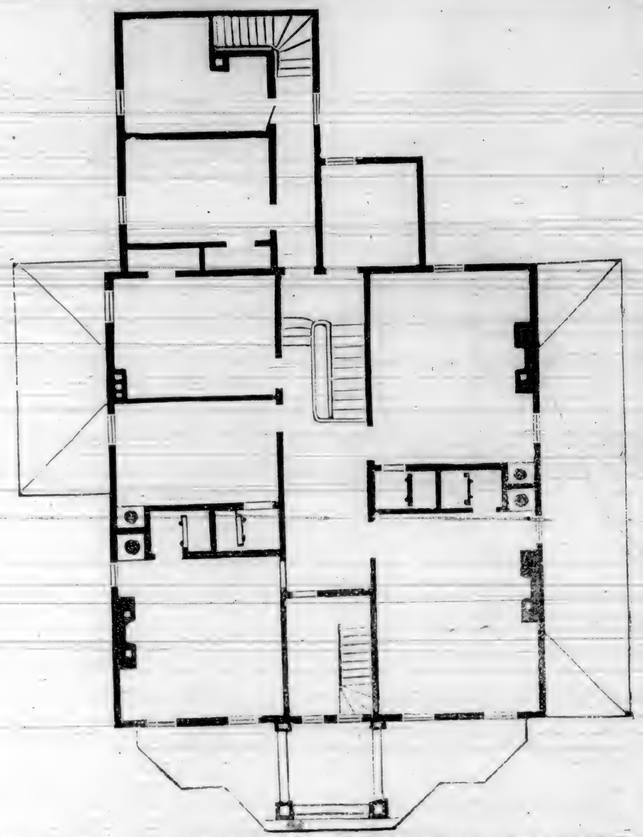

PLATE 3.—GROUND PLAN OF SECOND FLOOR COUNTRY RESIDENCE.

With or Without an Architect.

It is altogether possible that mistakes, sometimes of material consequences, should be made by owners in the improvement of their real estate, whether they employ an architect, or venture to plan and superintend the erection of buildings unaided by the advice and judgment of one at least *presumed* to have educated himself in the essential secrets of the constructive and mechanical arts, in connection with house planning and construction; and who by daily experiences *should be* far better qualified to suggest, determine, and direct building operations than one whose store of architectural, mechanical, and building knowledge is entirely superficial, incidental, and gleaned from sources of uncertain and hypothetical character.

Millions of dollars are unwisely expended yearly in the erection of buildings to which present allusions fitly apply. There are but few edifices erected so perfect in every part and detail as to be beyond the reach of criticism. Faults and blemishes are almost certain to creep in, in some connection, under the best and most thoroughly competent management. The combined best judgment of the owner, and the experience and skill of a *qualified* architect, does not always result in the amplification of absolute perfection. And if this be true as a rule, to what a fearful extent must mistakes abound with those who place their building interests in the hands of that class of pretenders, who can be rated no better than sickly parasites upon the architectural profession—men wholly unqualified in intellect, and doubly so in architectural and mechanical knowledge. There are thousands of this class aping professional qualifications, particularly in the United States, where the exacting and rigid requirements of prolonged servitude and severe educational ordeals enforced in the older countries of the world are not observed, rendering it possible and easy for inefficient men to worm their way in and assert claims wholly unsustained by actual qualifications.

Consequently, when owners are so unfortunate, either perchance or from choice, to fall into the hands of such men, a great mistake is made in the selection, and, as a matter of course, errors of greater or less magnitude follow. But when an owner undertakes to assume the prerogatives of an experienced architect, he commits an error which, in multitudes of cases, reacts heavily upon his financial interests; for however much he may pride and flatter himself at the *self-satisfying* success achieved, we have yet to examine the first building erected by the plans and under the exclusive direction of the owner, in which the finger-marks of inexperienced and the lack of practical knowledge were not prominent. Nor is this more nor less than a natural sequence. Thousands of men spend a lifetime in efforts to acquire a perfected knowledge of architecture, who never succeed beyond certain limits, although earnest in their efforts, for the reason that the object of study and pursuit, in its magnitude and unlimited scope, and its innumerable details, is beyond their mastery. And this being true in reference to men who *desire and labor* to acquire knowledge in a certain direction, is it not presumption on the part of those who have never made the subject a matter of more than incidental study, and whose experiences are confined to the ordinary observations and contacts of daily life, to assert qualifications which others have secured only by years of arduous devotion and application? It is not reasonable; and, as we have before remarked, millions of dollars of gold is expended yearly in the attempted improvement of real estate, which yields a far less return than would be received if the improvements were, in detail and completeness, what they might have been made under the direction of a *skillful and qualified architect*.

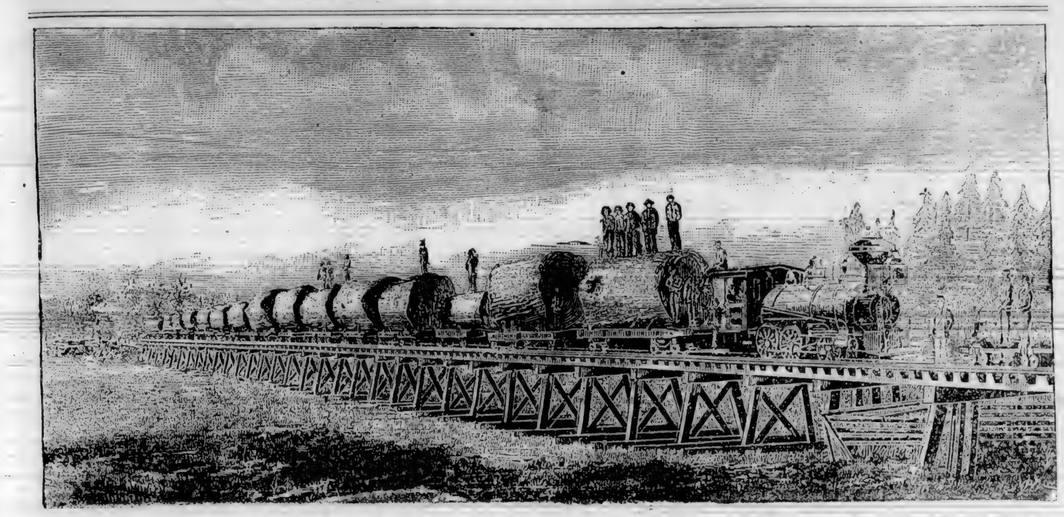
Church Acoustics.

Ask the hearers in a large church if they heard the sermon well, and probably one out of four will confess to having only heard it imperfectly, or to having lost a good deal of it. The blame in these cases will often be laid on the preacher's voice or pronunciation, or on the defective construction of the church, or the place where the hearer sits, though in reality the loss of the sermon, in whole or part, is probably owing to defective hearing. As churches are built, and preachers are paid for intelligible worship and instruction, it is extremely desirable that sermons should be heard by all who come to hear, or if this cannot be absolutely attained, by as many as possible. Yet no special attention to this object seems to be paid either in the construction of churches or the education of ministers.

The common faults of construction are: first, a roof far too high, in which the sound of the voice ascends and is in a measure lost; second, a pulpit three or four feet too high. Sound ascends easily, but descends with difficulty. Try the experiment in your own house of calling over the banisters to persons on the flat below, and then reversing the positions. In the one case you may call almost in vain, in the other you are distictly heard at once. The preacher should therefore be as little above his hearers as possible, so as to be seen distinctly by all.

The common faults in ministerial utterance are: first, a lack of distinctness in pronouncing each syllable of every word; second, sinking the voice low at the termination of the most emphatic parts of the discourse; third, shrieking at times so high that the words are lost in the unnatural sound. There seems to be no regular training at colleges and seminaries in the great science and art of elocution. Yet this training is as necessary to a preacher as training is to a singer. Many of the faults in church buildings and deficiencies in preachers could, however, be mitigated by the simple lowering of the pulpit, and providing it with a sounding-board. If hearing were made easier, there would be a greater inducement to attend church, and the proportion of attendants who cannot hear distinctly would be greatly reduced.

Would it not be well for those masters in the science of hearing, who have invented the wonderful telephone and phonograph, to turn their attention to this matter in order to discover and announce the conditions necessary to the most accurate hearing in churches? Science could not find a nobler task, seeing that at present architects are evidently working in the dark. Not one church in a dozen, probably, fulfills the best conditions for distinct hearing by the whole audience.—*Ex.*



TRAIN OF CARS LOADED WITH REDWOOD LOGS.—FROM A PHOTOGRAPH TAKEN ON THE LINE OF THE HUMBOLDT LOGGING RAILWAY, IN HUMBOLDT COUNTY, CAL.

Logging in California.

[The above cut represents so plainly such a familiar scene to many of our subscribers that it is with pleasure that we reproduce it from an engraving in a late number of the Scientific American Supplement.]

Most of the timber is now felled with saws instead of axes, as hitherto, it being found that the tree jumps better from the stump, and causes less waste by breakage, than where the ax is used. The trees are then barked, and a fire run over the ground to burn up the bark and rubbish. Green redwood burns with such difficulty that the good logs are rarely affected by the fire. And now, when all that will burn has been consumed, begins the real labor of getting out the logs. For handling these monsters no ordinary road will answer. It must be wide and smooth as a turnpike, all rocks and roots must be carefully removed, all hollows and gullies filled up; if the road is level or soft, skids must be laid down. If the logs are small, of course such care need not be taken, but for large timber it requires good engineering, and much hard work even, to build a good logging road.

With the road built, comes the labor of rolling the logs into it. Cattle alone would be useless, except for the smaller logs. Blocks and tackle, often double and sometimes triple blocks, are needed to roll them out of their beds. Nor will any ordinary teamster answer to handle the cattle. He must be a man of judgment and skill. The best teamsters command a salary of from $100 to $150 per month, and board. The "bull whacker" is usually the highest-priced man in the camp.

Once in the road, several logs are fastened together to make a "train," and are hauled to a landing to be loaded on to cars, or to the stream to be floated to the mill. The train of logs once started, there must be no stopping if it can be avoided. All along the road are stationed barrels of water. As the train moves, a man runs along beside it, and filling and refilling his pail from the barrels, throws water in front of the train, that there may be as little friction as possible. The loads hauled are sometimes enormous. One train of seven logs, hauled on Humboldt bay in 1878, by A. A. Marks, teamster, with five yoke of oxen, scaled, collectively, 22,500 feet, board measure, of merchantable lumber. No wagons are used in the woods; the logs are simply "snaked" on the ground.

Until within the last year, all this labor of handling logs in the woods has been done with cattle, but now they are in many places using steam for this purpose. The machine used is "Dolbeer's Patent Steam Logging Machine." It consists of an upright boiler and engine, somewhat similar to a portable hoisting engine, except that, instead of a reel to wind the rope on, it has two "gypsy heads," one on each end of the reel shaft. It sits on a strong frame, the sides of which are like sled runners. It has a strong purchase from the engine to the "gypsy" shaft. To move the machine around in the woods, they run a line ahead, make it fast to a tree or stump, take two or three turns around the "gypsy," and start up the engine. In this way it hauls itself wherever wanted. When the machine is in place, it is made fast to a tree or stump, and a line run to the log to be moved, and by means of snatch-blocks the log is hauled in any direction desired. By use of this machine, heavy logs are brought out of ravines and bad places, where it would be almost impossible to get them with oxen or horses. The wooden railroad, or tramway, is used in many places for transporting the logs to the streams, or to the mills; but as the more accessible timber is being cut off, these are being supplanted by iron and steel rails, and locomotives.

Our redwood mills are generally up to the times. All the modern improvements of double circulars, gang saws, pony saws, gang edgers and trimmers are in use. While double circulars are used in nearly all the redwood mills, many mills on Humboldt bay are using, besides, what is called "Evans' third saw." This is a saw hung on a horizontal arbor above the double circulars, and cuts down from the top of the log to a little below the arbor of the middle saw. While, of course, it is parallel to the two lower saws, its cut is made four inches out further into the log. Besides this saw, there is a fourth smaller saw, which is hung on a perpendicular arbor, and makes a horizontal cut into the log just at the bottom of the cut made by the third saw. The effect of running these two saws is to rabbet out a piece, extending from the top of the log to a little below the arbor of the middle saw. These three larger saws are usually from 60 to 64 inches in diameter, and mills thus arranged can cut logs eight feet in diameter. Logs larger than that must be split.

There are about forty mills engaged in cutting redwood. The largest have a capacity of 75,000 or 80,000 feet per day. Perhaps the average would be about 40,000 feet daily.

But very few, however, run all the year round, both on account of the difficulty of keeping supplied with logs, and because the places where many of them are situated are not safe harbors for shipping in winter. As very few of the mills are connected with the market by rail, nearly all the lumber is transported by sail vessels.

The amount of redwood lumber sawed by these mills in 1881 was not far from 140,000,000 feet. Of this, 95,000,000 came to the port of San Francisco, 4,500,000 feet being reshipped to New York and foreign ports. The balance of 45,000,000 feet manufactured was distributed to the lower ports in California, Mexico, South America, Sandwich Islands, Society Islands, and Australia, vessels going direct from the mills.

Mechanics' Wages Three Hundred and Fifty Years Ago.

Hengrave Hall, in Suffolk, was built by Sir Thomas Kitson, in the reign of Henry VIII.; begun in 1525 and finished in 1538. The price of labor at that time was: for masons per day, sixpence; laborers, fourpence; carpenters, sevenpence; joiners, eightpence; sawyers, sixpence; carvers, sixpence; painters, sevenpence; thatchers, fourpence. Board and lodging for mechanics, one shilling and fourpence per week. —*Gage's History.*

In England, objection is raised as to the method of binding the bundles of lath exported to that country. The most of them are bound with wire, which corrodes, and causes the bursting of the bundles, which are subjected to rough treatment on the other side. String or unwoven rope is preferred.

☞ Science of Carpentry Made Easy, $5.00.

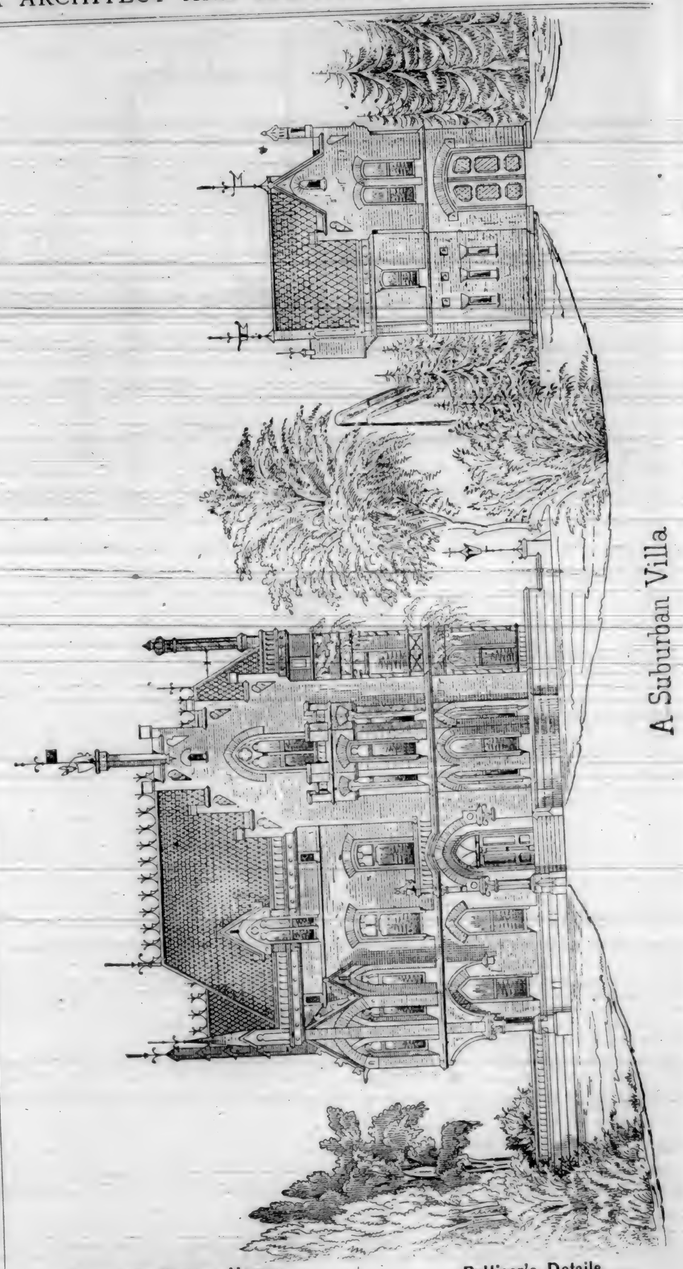
Architecture in 1882.

Never had it occurred to us to look upon the Royal Institute of British Architects as a body incorporated for the promotion of practical jokes; our eyes are, however, now open to our deficient appreciation of the capacity of that distinguished society when it unbends itself to high jinks. The subject of its principal prize for the present year was a "West-End Club" (1105), and it has crowned Mr. Beresford Pite for a marvelous "labor of an age in piled stones," a castle grim and mediæval, broad spaces of bare wall, mullioned windows, narrow loop-holed openings, porches through which an army with banners might deploy; crenelated towers bristling with conical cappings; altogether the structure in which Beauty might have slept her enchanted sleep, or out of which one of the giants whom Jack the Great quelled might have sallied on his murderous forays. There is of course a reason for all things, and we conclude that Mr. Pite is a gentleman of an ascetic frame of mind, who has learned, during the inquiries into the natural history of clubs by which he drilled himself for his great and successful effort, that the members of these frivolous bodies had the bad habit of wasting their hours in staring from large windows at the men and the women, the carriages and the horses, which throng the streets: so, as a practical apostle of morals, he made it his duty to rebuke and check such unseemly levity on the part of all who might be fortunate enough to pass the ballot of his club. The decision of the Institute was, we conclude, reached in consequence of its leading spirits being at this minute, as loyal Englishmen, much exercised by Irish lawlessness, so that they could only look upon a building for the occupation of single gentlemen as partaking of the nature of a prison for suspects, and we must own that, regarded in the light of a veiled provision for the safe keeping of Irish patriots, Mr. Pite's castle in the air is singularly appropriate. It is a pity that the Government's sudden change of policy should have frustrated such healthful intentions when the man was there to provide a nobler and a more terrific Kilmainham. Mr. Howard Ince's design for the closely affined "Casino or Club for an Inland Watering-Place" (1145), which won the first prize at the Royal Academy, is not so mirth-inspiring. Nevertheless, we are unable to see the appropriateness for its object of the somewhat solid composition of Perpendicular and Jacobean, with a tower curiously recalling—probably from some accident of drawing—but with attenuated proportions, the tower of the Record Office. If the prizeman and the adjudicators respectively were put under compulsion to produce variants of the design to serve as an inland town-hall and a marine casino, we fancy they would be puzzled as to what features to retain and what to alter.—*Saturday Review.*

Practical Lessons on the Science of Carpentry.

A work that every mechanic should have. It is designed to make the science and art of carpentry clear and comparatively easy to all who require information on the subject. This book is also of use to all who have barns, bridges, and outhouses to build, and require information how to accomplish the work. Sent post-paid to any address, upon receipt of $5.00.

Platt B. Walker, of Minneapolis, Minn., and George F. Brott, of Louisiana, propose to solve the sawdust problem, by mixing the dust with peat, and thereby producing a portable fuel. The compound thus formed cannot be easily fractured, and can be transported as easily as wood or coal. These gentlemen have secured a patent on their process.



A Suburban Villa.

American Cottage Homes.

REDUCED TO $3.00. On account of the publishers changing the location of their business, they intend to clean out effectually all their stock on hand. To do this, they have REDUCED THE PRICE OF THEIR COTTAGE HOMES TO $3.00. Will send a copy to any address, upon receipt of the price.

Palliser's Details.

REDUCED TO $2.00 PER SET. The authors are determined to close out their present lot of Details, as they intend to move to New York city. In conformity with orders to take effect after August 1st, 1882, we have reduced the price; post-paid to any address, upon receipt of $2.00.

(APPLIED WHOLLY BY BORING.)

HOBART B. IVES, NEW HAVEN, CONN.

Sole Manufacturer and Patentee.

Peculiar Architects.

Architecture in its truer sense has for centuries occupied a high and honorable position among the beautiful sciences of the world, and deservedly stands second to none; for in addition to the high order of skill and artistic qualification necessary to qualify the architect to produce in harmonious lines and proportions the conceptions of his mind and intelligence, the after work of delineating in construction the correctness and beauties of those conceptions, is a work which none but those who have delved into and understand the thousands of *minutiæ* involved in the practice of the science of architecture, are competent to comprehend.

But the purities of the science introduced and incorporated by the masters in former ages have been departed from, and the see-saws of time, and the ever-changing fancies of the reckless æsthetics and adventures in the practice of architecture, who have aimed more at indulging the whims and caprices of clients, anxious for some new thing or style to gratify their sentiments of the beautiful—however much at variance with the principles upon which the grand structure of architecture rests—have wrought demoralizations, and opened the doors through which it has been made easy for the incompetent to enter and assume professional standing, far and largely beyond their natural or acquired qualifications.

Consequently, the profession is overrun with *peculiar individuals*, who are as little qualified for its practice as many of them would be to assume the professorship of an institute of science, whose threshold in any connection they have never crossed; and yet it is a fact that intelligent business men often fail to discover the deficiency of such parties, and distinguish between competent and incompetent architects, and are thereby led into building engagements with a class of men denominating themselves architects, to whom it is simply merciful to apply the term *peculiar*.

Complaints against "*my architect*" are of common occurrence by owners, and the profession is subjected to continuous reproach through the acts and errors of this *peculiar class*. The injustice of this general denunciation must be apparent to every discriminating mind, and the owner who permits himself to be ensnared and entrapped by a *peculiar pretender*, when by reasonable effort many good and qualified architects might be found, should acknowledge his folly and mistake, and refrain from all abuse, except against his own error, and in all after operations seek to find and entrust those into whose hands it would be safe to confide building or any other interests with assurances of safety as to abilities and moral rectitude.

Architectural Education.

A congress of architects met last month in Paris, and although no very exciting questions were discussed, the proceedings seem to have been interesting. Among the discourses delivered was one by M. Trélat, on the higher architectural education, forming a sort of supplement to that in which he considered the general subject at the congress of 1878. The substance of M. Trélat's views seems to be that architecture would be best taught in two successive and almost distinct stages. The first of these would be the technical training—the acquisition, as he says, of the instruments of the art; and this portion of architectural instruction being a matter of regular progress toward an end, could with advantage be given in special schools scattered throughout the country. The second stage having for its subject architectural design simply, should, on the contrary, be confined to a single school, carrying out its course by the well-tried and successful method of competition, but increasing its usefulness by greater care than is now possible at the Ecole des Beaux-Arts in considering the comparative merit of the designs submitted for judgment. The jury, instead of being expected to act without compensation, should be paid for a service, which is, when properly rendered, both long and difficult. The wholesome traditions of the school should, moreover, M. Trélat thinks, be maintained and defended against the danger which threatens solid artistic attainment from the cloud of attractive novelties which distract the mind of the student, and waste his time in vain pursuit of an endless succession of *armours de circonstance*; and this can best be done by placing the direction of the higher education in the hands of men of firm conviction, but freed by breadth of experience and knowledge from the prejudices of passing fashion, who should form a permanent jury to criticise or reward the work of competing students. In this way, although there might perhaps be some trouble in finding a perfectly satisfactory jury, French architecture would at least gain the advantage of being guided in a certain fixed direction, instead of wandering erratically toward all points of the compass in seccession, and its ultimate progress would be so much the more rapid in consequence.—*American Architect.*

A new plan to deaden floors has been patented, and is being tested in a new building at Philadelphia. A 6x3 plank is inserted between each joist two inches from the bottom of the joists, and projecting four inches beneath. Underneath the intervening planks the ceiling boards are nailed and the space filled with sawdust to within one inch of the joists. By this method the waves of sound are carried off, and it is claimed that the most vigorous hammering cannot be heard in the story underneath.

Spirits of turpentine is now made from sawdust and refuse of the saw-mill. It is extracted by a sweating process, and yields fourteen gallons of spirits, three to four gallons of resin, and a quantity of tar per cord. The spirits produced has a different odor from that produced by distillation.

☞ Science of Carpentry Made Easy, $5.00.

Concerning the relative value of cedar and pine, an exchange says that a recent examination of a bridge built some twelve years since, in which both woods were used, revealed the fact that the pine supports had so far decayed as to be entirely useless, while the cedar was still intact.

It is asserted that articles of iron or brass may be bronzed by dipping them into melted sulphur mixed with lamp-black. The surface, after being drained off, will take a beautiful polish, and presents the appearance of oxidized bronze.

UTILIZE YOUR BASEMENT APARTMENTS

In the Business Part of the City by using

HYATT'S PATENT ILLUMINATING ROOF

—AND—

BASEMENT EXTENSION.

THE LENSES MAGNIFY, HEAT, AND DO NOT BREAK.

SEE ALL NEW BUILDINGS ON THE BEST BUSINESS MART.

The present dark, damp Cellars, or Coal Vaults, of old buildings made light, cheerful, and well-ventilated Business Apartments suitable for Offices.

Read the following of the many Testimonials received:

LEVI STRAUSS & Co., Importers, 14 and 16 Battery Street,
SAN FRANCISCO, March 4, 1881.

MESSRS. P. H. JACKSON & Co., No. 2 California Street:

The alteration made by you by cutting out the six door sills and risers on the front part of our store, 14 and 16 Battery Street, and substituting HYATT'S PATENT ILLUMINATING ROOF, is quite satisfactory in making in the basement apartment below, in the front part, all that we could desire as regards light. Our entry clerks are now able to work without the use of gas.

LEVI STRAUSS & CO.

The **Basements of Messrs. Murphy, Grant & Co's Buildings,** on Bush and Sansome Streets, have been altered and are now lighted by this Improvement.

HYATT'S PATENT

FIRE AND BURGLAR-PROOF SKYLIGHTS.

The Public are requested to examine the **large quarter circle** skylights, recently erected in the rear of **Senator Fair's** building corner Sansome and Pine. Also **A. B. McCreery's** building corner of Pine and Davis. By the use of these heavy Skylights, which are both fire and burglar-proof, **no extra charge in rates is made by the Insurance Companies than if no Sky-lights were used,** as they are not destroyed by fire, like the wood and sheet-iron skylights in common use; besides the occupant of the premises may feel his goods are safe from robbers during the time the building may be closed.

☞There are many deep stores in this city that are much in need of light, and by an addition of these Skylights all light can be obtained, besides security against thieves is maintained.

The appearance of the Skylight, as seen from the front of the store when the sun is on it, glistens with the thousands of hexagon lens. The Cosmopolitan Building, as altered, has these Skylights on the rear of the deep stores.

P. H. JACKSON & CO.

Sole Licenses and Manufacturers for the Pacific Coast of Hyatt's Patents,

No. 2 California Street and No. 231 First Street,

SAN FRANCISCO.

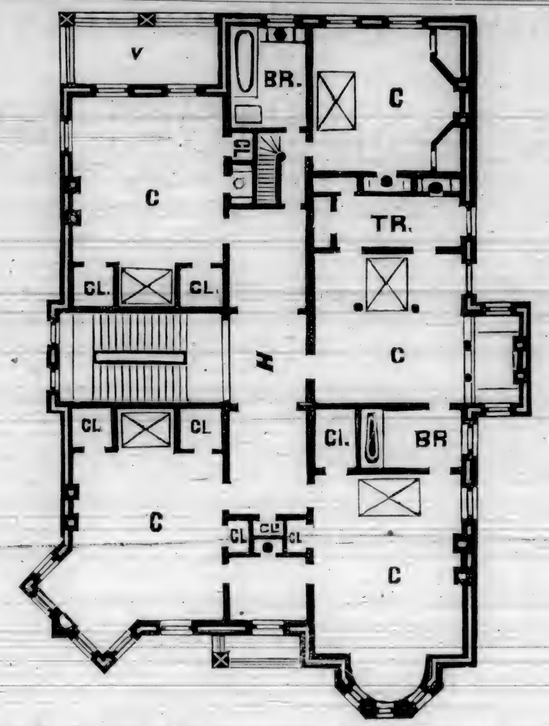

PLATE 6.—GROUND PLAN OF SECOND FLOOR SUBURBAN VILLA.

Removal Notices.

MESSRS. MILNE & GANTS have removed from their old stand to 618 WASHINGTON STREET. A full supply of their PERFECTION WATER CLOSET always on hand.

SYMMES & STOW, having purchased the business formerly conducted by THOMAS DAY & Co., will be pleased to see all the old customers at 122 and 124 Sutter St.

T. J. BASS & Co. have removed to 14 and 16 Ellis St.

A. F. NYE & Co. have removed to 609 and 611 Market St.

HAROLD D. MITCHELL, architect, removed to 405 California St.

CUBLETT & EISEN have secured still another office in same building as present located, for a private reception and business office.

J. KEMP & Co. removed to 112 Mission St.

H. MACY, architect, removed to 124 Sutter St.

KIRBY & SON, architects, located at 106 Leidesdorff St.

PAINTS.—The price of paint has been reduced owing to the competition of Eastern firms. The best white lead can now be had for 6½ cents per pound.

According to Edwin Alden & Bros.' American Newspaper Catalogue, just issued, there are 12,158 newspapers published in the United States and the Canadas. Total in the United States, 11,522; Canadas, 636. Published as follows: Dailies, 1,152; Tri-Weeklies, 80; Semi-Weeklies, 150; Weeklies, 9,078; Bi-Weeklies, 23; Semi-Monthlies, 202; Monthlies, 1,290; Bi-Monthlies, 12.

Building Intelligence.

We present a very complete report in this issue. Although the list is a very large one, it will be noticed that but very few of the better class of dwellings have been started the past month.

We take pride in the improvement we have made in arranging the items of building news. A glance, almost, will suffice to enable the reader to find the location of any desired improvement.

The mark "x" signifies between.

SAN FRANCISCO.

O'Farrell, cor Larkin. Two-story frame building.
O.—G. G. Burnett.
A.—Wolfe & Son.
C.—Sylvester & Langabee.
$11,500.

Sutter, No. 1418. Enlargement and repairs.

O.—J. R. Spring.
A.—Babson & Seadler.
C.—Gilbert & Brown.
$2,000.

OAKLAND.

San Pablo Ave. Station. Two one-story frame cottages.
O.—Klinker.
A.—S. & J. C. Newsom.
C.—Dowling.
$4,000.

Seventeenth, x Sixth and Seventh Avenues. Additions to two-story frame.
O.—L. H. Wakefield.
A.—S. & J. C. Newsom.
C.—Knight & Littlefield.
$1,600.

Tenth, cor Jefferson. Four two-story frame dwellings.
O.—Lamoreux.
A.—Matthews & Son.
C.—A. Childs.
$8,000.

Central Ave., x Twelfth and Thirteenth. One-story brick building.
O.—White & Wallman.
C.—Geo. Flick.
$3,000.

Twenty-third, x Valdez and Waverly. One-story and basement frame cottage.
O.—C. Ashton.
A.—S. & J. C. Newsom.
C.—C. Kimball.
$2,000.

Seventh Ave., x Tenth and Eleventh. Two-story frame building.
O.—A. Malpas.
A.—S. & J. C. Newsom.
Days' work.
$1,000.

Harrison, No. 1,268. Additions to building.
O.—W. P. English.
C.—Haskell & White.
$600.

Frame building near Lake Merritt.
O.—Rouse.
A.—Newsom & Gash.
Days' work.
$1,500.

Jefferson, cor. Twelfth. Two-story frame residence.
O.—O. B. Smith.
$4,500.

San Pablo Ave. and Sixteenth. Two-story building—stores and dwelling.
O.—J. C. Estey.

Filbert, near Twelfth. Two-story frame.
O.—Benson.

Wood, x Chase and Taylor. Three one story cottages.
O.—J. Ziegenbein.

Taylor, cor. Wood. Two-story frame residence.
O.—W. S. Jeffries.

East Oakland.—Additions.
O.—Dr. Pinkerton.
C.—Haskell & White.
$400.

MISCELLANEOUS.

Maxwell. Two-story brick school house.
O.—Colusa County.
A.—S. & J. C. Newsom.
C.—J. M. Warren.
$30,000.

Centreville. Two-story and basement frame.
O.—Dr. Hall.
A.—S. & J. C. Newsom.
C.—Knight & Littlefield.
$5,500.

Stege. One-story brick building.
O.—Vulcan Powder Co.
A.—H. C. Macy.
C.—C. Holmes.
$1,200.

Fresno. Two-story brick building.
O.—J. Ryan.
C.—J. Clifford.
$6,000.

One and one-half story frame building.
O.—Hughes & Son.
Days' work.
$6,000.

One-story frame dwelling.
O.—L. Einstein.
A.—Kenitzer & Raun.
C.—Carlson & Bro.
$4,000.

One-story frame dwelling.
O.—Chas. Schloch.
C.—W. J. Beers.
$1,000.

One-story frame building.
O.—John Miller.
C.—W. J. Beers.
$600.

Wheatland. One-story brick building.
O.—Farmers' Bank.
A.—A. A. Cook.
C.—Swain & Hudson.
$4,233.

San Jose. Second near San Antonio. Two-story frame dwelling.
O.—Mrs. M. E. Bassett.
A.—J. O. McKee.
C.—W. A. Boyler.
$2,600.

At the Willows. Two-story and basement frame.
O.—T. B. Keesling.
A.—J. O. McKee.
C.—Carter & Clark.
$6,000.

Cor. Sunol and the Alameda. Two-story brick.
O.—John Davey.

Additions to flour mill.
O.—Moody.
C.—J. Lenzen.

Pleasant Valley. Two-story frame building.
O.—J. M. Pleasants.
A.—A. A. Cook.
C.—T. D. Ball.
$2,000.

Ukiah. One-story frame building.
O.—Mendocino County.
A.—A. A. Cook.
C.—W. A. Evans.
$8,240.

Tehama. Two-story brick dwelling.
O.—J. C. Tyler.
A.—A. A. Cook.
Days' work.
$16,000.

Seattle. Four story brick and iron building.
O.—Leary & Yesler.
A.—W. E. Boone.
C.—Ranke & Loshe.
$40,000.

Red Bluff. Two-story brick building.
O.—Red Bluff Lodge, I. O. O. F.
A.—A. A. Cook.

Chico. Two-story frame dwelling.
A—A. A. Cook.
C.—A. J. Bryan.
$5,000.

Colusa. Two-story brick building.
O.—Colusa City.
A.—J. C. Matthews.
C.—Burrell.
$20,000.

Two one-story and basement cottages.
O.—S. H. Wade.
A.—J. C. Matthews & Son.
C.—W. Dahl.
$4,000.

Napa. Additions to building.
O.—William Hunter.

Division. St. Two-story and basement frame dwelling.
O.—H. Goodman.
A.—J. Marquis.
C.—H. H. Knapp.
$6,000.

Tamalpais Station. One-story attic and basement cottage.
O.—Hall McAllister.
A.—Newsom & Gash.
C.—G. D. Nagle, mason; J. T. O'Brien, carpenter.
About $20,000.

Princeton. Two-story frame near town.
O.—Jos. McVay.
C.—W. Herrin.
$7,000.

Frame dwelling near town.
O.—Hugh Williams.
C.—W. Herrin.
$4,000.

Woodland and vicinity. Main, cor. Railway. Two-story brick, 80x140.
O.—Freeman, Porter & Co.
A.—W. H. Carsen.
C.—McMullen & Scott, masons; carpenter work by the day.
$25,000.

Main, cor. Second. Two-story brick for town hall and engine house.
O.—R. H. Beamer.
C.—Craft, mason; carpenter work by the day.
$15,000.

Railway. Two-story frame.
O.—Cohen.
C.—Cadwell.
About $15,000.

Main. Iron front to two stores.
O.—F. Ogburn.
C.—W. H. Carson.
$800.

Second. One-story frame
O.—McGommow.
$800.

Near Cacheville. Two story frame.
O.—Hoppins.
C.—W. H. Winnie.
$6,000.

Hungry Hollow. Two-story frame.
O.—Foster.
C.—Blake.
$4,000.

Labor Movements in San Francisco.

During the long period of severe dullness which preceded 1881, and which was the outgrowth of Kearneyism and the new Constitution, the working classes of California were compelled to submit to reductions in wages, and thousands found it difficult to obtain employment, even at low rates of compensation. But with the revival of the building business, which set in during the last past year, and especially so during the present year, wages in nearly all lines of mechanical pursuits have gained firmness; and many families among the working classes, who had struggled through the dark days of dullness, have been made comparatively happy by the return of better times, satisfied for the time being with the improvement in engagements and pay. No movement of special moment was inaugurated having for its object a general advance in wages through concerted society organization, many of which had in former years flourished; but from the financial inabilities on the part of the membership to perpetuate them, and business conditions not seeming to justify their continuance, they were permitted to die out. But the increased activities of the year have induced reorganization and a revival of the society affiliations in nearly all the branches of labor.

This is, so far, well. The banding together of men with common interests is as it should be, as all pursuits in life are benefited by the assembling of those engaged in them, when the objects and purposes actuating are based upon the right, and wise counsel prevails. But when influenced and controlled by rabid minds, bent upon the accomplishment of projects not within the bounds of sound reason and for the common good of all, action is apt to be brought about, calculated to arouse opposition within and without, and raise obstacles and antagonisms prejudicial if not destructive in character.

The developments and improvements in scientific and mechanical spheres are as much the result of free discussion and the interchange of thought among the leading men engaged in them respectively, through societies, assemblies, conventions, the publication of books and papers, and similar methods, as from special personal abilities and effort. By these means, men gather information and secure new ideas, which enables them to extend and enlarge upon first thoughts and conceptions, and produce results which would never be reached by them if debarred from the benefits and advantages derived from mutual, personal affiliations.

The great obstacle in the way of better results in labor organizations exists in the limitedness of purpose. Some one idea which becomes the prominent or sole factor of the movement is made the issue from the beginning, and its enforcement is insisted upon with rigid persistence, either with or without the approval of opposing interests, or any effort being made to reconcile the opposition. Hence we advise that labor movements shall make haste slowly, deliberate wisely, and act prudently. The general on the battle-field who holds special advantages in forces and position may press and defeat the adversary according to his own pleasure; but in business battles, where the rights of all parties in conflict are protected under the law, the advantages cannot long remain one-sided. If labor for the time being asserts and secures prestige, capital submits only so long as compelled to do so, refusing unconditional surrender while seeking for shelter in more quiet and undisturbed retreats. Hence the necessity for higher and broader purposes in labor organizations than the arbitrary and dictatorial objects more generally made the basis of action.

We speak not a word against wise labor organizations, but heartily commend them, with these qualifications: that they be established on broad principles of mutual rights, and more for the purpose of the culture and improvement of the membership than the arbitrary enforcement of any single peremptory requirement.

For enforced results are never permanent, when the means of escape are possible. And if the mechanics of California would unite and establish organizations of the character suggested, it would enhance their interests, and secure to them a power and influence for good far greater than all the one-purpose movements that can be conceived. There is a vast volume of talent and mental and moral excellence within the circles of labor in California, which may be developed and rendered almost irresistible, by the concerted action of the laboring classes. And it is a matter of surprise to us, that so many intellectually competent men should permit the multiplied favorable opportunities within their reach to pass unimproved. "It can't be done," is the sluggard's reply. What right thing is there that honest men banded together on right principles cannot do? Rugged mountains have been crossed by the foot of man, and the "iron horse" has made his way through snow drifts and over lofty peaks; oceans have been reduced almost to mill-ponds in effect, by massive vessels, designed and built by man, defying the rudest storm, and fleeing before the fierce winds; continents have been discovered by men of will power; and our own great nation is the result of the doings of the determined souls whose feet first trod the virgin soil of America. In all the successful works of life, it requires the exercise of the will power, which, sustained by pure motives, is irresistible.

The "Carpenters' and Joiners' Union" has secured the concession from the bosses of the men quitting at four o'clock on Saturdays for full time. There seems to have been but little opposition to this arrangement, which is likely to continue during the winter months, as men can do but little after that hour through the season of early sunset. And should the spring work start up early and lively, the rule may extend through the coming year. But if there should be a let-down in building activities, and the market be flooded with labor-seeking employment, it is not likely that men requiring steady work to meet daily demands will remain idle for the sake of sustaining the eight-hour rule on Saturdays. We hope, however, that our future prosperity as a city may be such as will enable continuance of the rule, and that for years to come the concession of two hours on Saturday may be sustained.

The other special movement of the Union—that of breaking up the piece-work system—has been to some extent beneficial, as its presentation to the Chapter of Architects has enlisted a greater interest therein by the members of the Chapter, and the general discussion of the question among contractors has exposed the error of the method to such an extent, that none are willing to admit themselves guilty of the practice. Many, however, who disclaim culpability in this regard, do so very gently, and often with a very cherry-colored countenance, as if inclined to blush a little while protesting their innocence. But the members of the Union may rest satisfied that no piece-work will be permitted by the members of the Chapter, with their knowledge, on works under their superintendence.

The plumbers, marble-workers, and others have also revived or created society organizations; but in some cases may have demanded more than circumstances justify, unless a very propitious condition of business continues. All attempts to introduce new rules and regulations, calculated to increase cost and expenses, are destined to meet opposition; and unless there is power and force in the aggressive ranks, either in abundance of work or other controlling circumstances, the feebler must yield and accept the terms offered by the stronger. Consequently, it is wise on the part of those who seek to better their condition to forbear harsh measures, and strive to conciliate and accomplish their purposes by persuasive and argumentative means. The views expressed by us may not prove acceptable to all, or even a majority of the working classes, but they are the gleanings of fifty years' experience, and we are very well satisfied of their practical correctness. We have witnessed the rise and fall of scores of movements of various import—political, mechanical, professional, and others—which have gone down to dust and the slumbers of oblivion through unwise and injudicious management. We therefore hope wise counsel will prevail in the ranks of the laboring classes, and that prudence and equity and fairness may govern all their acts.

Early Rains—A Bad Omen.

Although there is no rule governing the seasons in California, which may be relied upon as invariable, still, the experiences and observations of the "oldest inhabitants" upon this coast sustain the theory that copious showers prior to the month of November indicate shortness of rain supply for the season. The month of September ending with rain, followed by heavy showers during the early days of October, does not argue well for a satisfactorily wet winter. No State in the Union is so disadvantageously affected by lightness of rainfall as California, as there exists *two* great interests, vital to the common welfare, while in other States

there is, as a rule, but *one*—that of agriculture in its various ramifications; while to this in the Golden State is to be added the great mining interests, which without sufficient rains suffer to a greater or less extent. Consequently the common interests of the State hinge upon the rainfall of the respective seasons, abundance and prosperity resulting in the years of abundant rains, while depressions and dullness ensue in years when the heavens fail to furnish the requisite quantity of water.

We hope that there may be a failure this year in the fulfillment of the commonly accepted theory that early rains presage a light, wet season, and that the present business outlook may not be dimmed by too much sunshine and "beautiful weather" during the months when, for the common good, muddy streets, miry roadways, and moderate floods are more to be desired.

The unexpected "first rains of the season" found but few prepared for them, and as usual, considerable damage has been experienced in building spheres, as the result of unfinished roofs, unprotected openings, etc. Many contractors and owners have suffered considerable damage to their works and property by neglecting to prepare in time for the uncertain storms, which neither come nor tarry because people are or are not prepared to receive them. But the experiences of the past thirty years fully demonstrate the fact that those who fail to adopt precautionary measures against rain storms by the early day in September, or who take it for granted that the rains are entirely over before the 1st of July, assume considerable risk in so doing. Heavy rains have fallen on or before the 12th of September in several years since 1850, and in as many or more cases late in the month of June.

A Word of Caution to Eastern Mechanics.

While gladly welcoming the immigration of mechanics from all parts of the world, of those who desire to locate in San Francisco or other parts of California, we deem it to be our duty to extend a word of warning to such to beware of erroneous reports in reference to the rates of wages prevailing upon this coast, and the probabilities of ready and permanent employment.

Sometimes the zeal and earnestness of writers for journals and newspapers override good judgment, and induce statements greatly in excess of actual conditions. The magnifying and inflation of real facts sometimes embellishes articles for publication, and glowing accounts are read with special interest, and accepted as true; and thousands of mechanics and others have been misled, and financially and otherwise injured, by being influenced away from good situations with false hopes of bettering their future prospects.

Our object in writing this article is simply to correct, as far as our influence may extend, any wrong idea that may have attained in other cities and States, in reference to the building interests of California. From information before us, it appears that quite a number of mechanics have left their eastern homes and good situations, and come to California, under the impression that business was brisk in this State, and wages higher than east of the Rocky Mountains; and that some of them have not realized their expectations. We therefore extend the following correct information, based upon personal knowledge as practicing architects, to wit:

The building business during 1878–79 was so light that only a minor proportion of the mechanics were employed, and positive distress existed among the working classes. 1880 shaded up a little better, followed by a still greater improvement in 1881, during which year, at times, but not continuous by the entire working forces were employed. With the commencement of 1882 a still greater improvement set in, and wages increased over the rates paid in 1879 and 1880, from $2.50 to $3 for carpenters, to $3 and $3.50, and in some cases $4. The latter amount being the exception. At times during the current year there has been a scarcity of good mechanics, and some advertizing has been done to secure help to forward work undertaken under a forfeiture for over-time. These temporary pressures and scarcities of help gave color at the time to liberal statements in reference to the necessity for a greater number of mechanics in San Francisco. But as we have stated, the pressure was but temporary, growing out of the fact that during a few months an unusual amount of work was let, among which some *half-dozen* buildings, costing from lesser amounts up to $150,000 or more. And these not being fairly distributed through the season, but bunched within a period of sixty to ninety days, necessarily exhausted the supply of workmen to rush them through, which being done, released the pressure, and again equalized the supply and demand for labor. During this condition of things increased wages were offered in some cases, with doubtful probabilities of the increase being sustained during the winter months, and not the slightest prospects for advance in the future over the figures stated. Brick-layers have at times been scarce, with wages at $5.50 per day for best men. But the amount of brick-work done during the year has been no more than sufficient to comfortably employ the resident working forces, except that for a *limited period* master masons found it difficult to obtain a sufficient number of workmen.

The same state of facts exist in connection with other mechanical branches, and for the information of mechanics in other States, we append the ruling rates of wages in the several lines. As before stated, carpenters, $3 to $4; brick-layers, $4 to $5.50; plasterers, $3 to $4; plumbers, $4 to less for scrubs; painters, $3 to $4 for special hands; laborers, $1.50 to $3 for mortar men and hod carriers; stair builders, $3.50 to $4.

We hope, however, that the facts furnished will not discourage any one from coming to California, who desires to change their places of residence, as there is room and opportunity for thousands of *competent*, energetic, and industrious people to settle down in the various cities and places of the Pacific coast, with good prospects of success. But let none come with the fancied idea that it is only necessary to *reach* California to secure all that heart and soul can wish, or that this is a State where wealth is obtained by the holding out of the hand, or the folding of arms until the Goddess of Fortune shall pour into the lap of the patient waiter gold sufficient for all the future necessities of life.

The Lateral Support Question.

Once more this question is being or will be ventilated, in the case of William Ede vs. James Phelan, in which the plaintiff seeks to recover $2,500 as damages arising from the defendant having excavated his property, adjoining that of the plaintiff, to a depth of fifteen feet below the official grade of sidewalk, for building purposes. It is claimed that the defendant did not "give any previous or reasonable notice of his intention," etc., and is therefore liable for the expenses incurred by the plaintiff in underpinning the walls of his building or buildings.

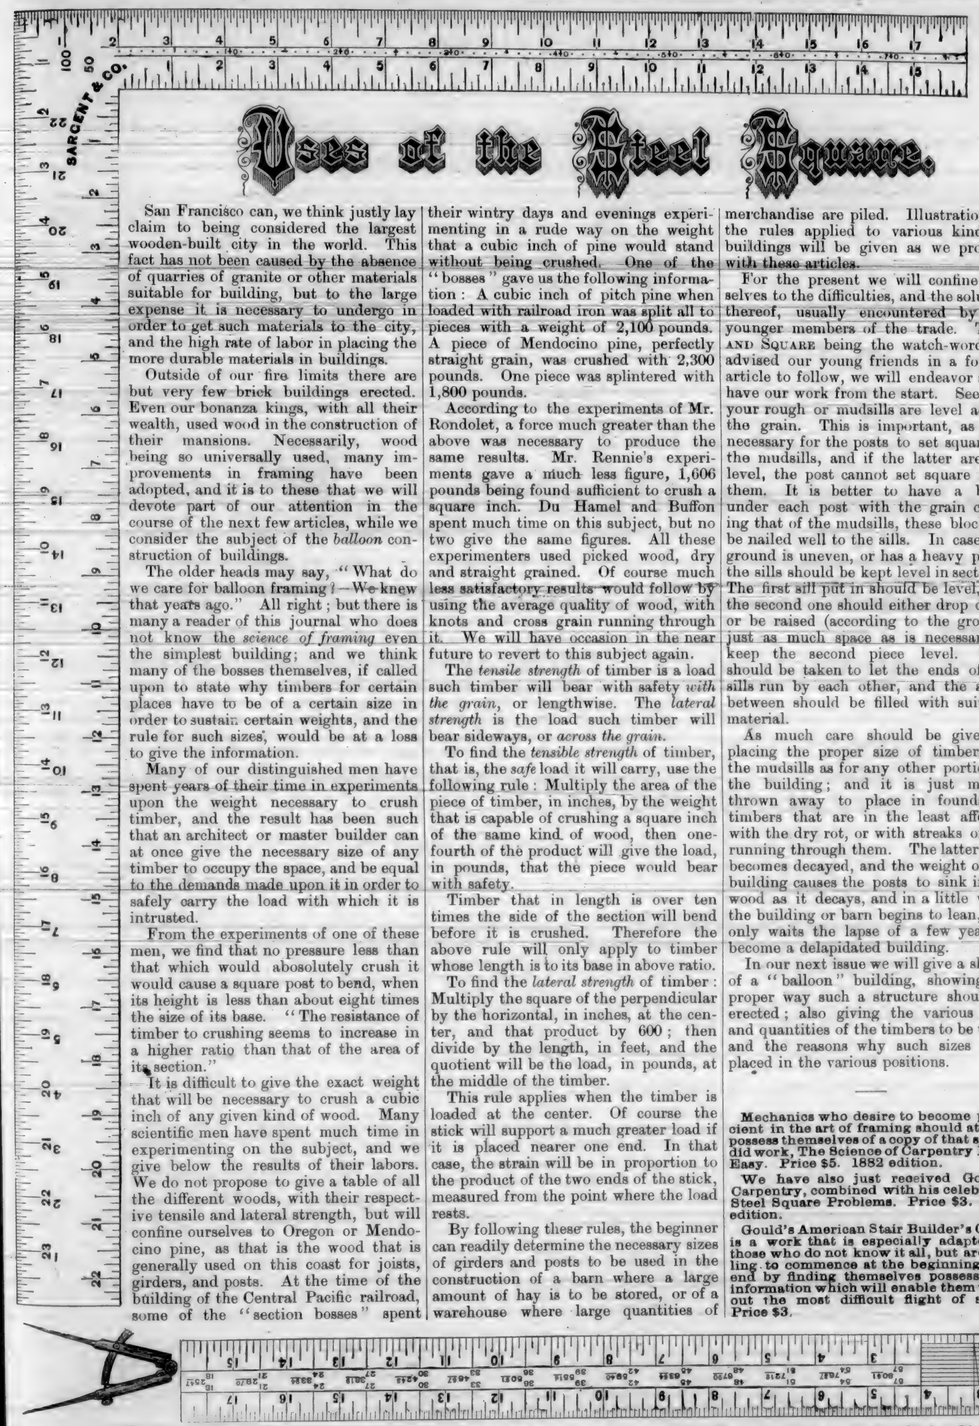
The City Ordinance, Section 5, Chapter VI, Order 1,281, as amended May 16th, 1876, very justly and equitably provides that all owners desiring to improve their property, may, by giving due and proper notice of intention, and using proper care, excavate to a depth of fourteen feet for building purposes, without being required to underpin the property of others. But Section 832 of the Civil Code annuls this ordinance, and as interpreted by the Fourth District Court, decided by Judge Morrison and affirmed by the Supreme Court, in the case of Ziele vs. Hood, that owners excavating must take care of and underpin the property of coterminous owners. But we have before argued, and still hold—although the case cited was decided in Ziele's favor—the question is not conclusively settled, as there is no *clearly expressed* conclusion as to whether the obligation is imperative upon parties excavating for the purposes of construction to do more than use ordinary and reasonable care in making such excavations, leaving it for the coterminous owner to protect and secure his own premises and property, by underpinning and otherwise. The Code expresses the right of owner to "excavate for purposes of construction," but in no clear and intelligent sense imposes the duty of building walls to uphold the adjoining buildings; and the decision quoted is based in part upon the assumed or proven fact that the defendant did not do certain things, his neglect to use proper care being one of the propositions operating to his disadvantage. As it appears to us, the courts have reversed the intent of the law in making the rights of the party excavating *subject* to the rights of the coterminous owner to lateral support; while the Code expressly state that the lateral support rights are to be "*subject to the right of the owner of the adjoining land to make proper and usual excavations for purposes of construction*, on using ordinary skill and taking reasonable precaution to sustain the *land* of the other, and giving previous reasonable notice to the other of his intention to make such excavations." As it appears to us, the language of the Code is complicated, contradictory, and indefinite, furnishing grounds for almost endless argument, and the basis of any sort of decision by the courts. And however clear it may be to legal minds, it requires a vast amount of explanation and twisting to make its clearness transparent to persons of no more than ordinary business sense and understanding. But as the law in the case is likely to be more fully ventilated and determined in the issue of Ede vs. Phelan, we shall await the final decision with interest. Judge Waymire having denied the demurrer of the defendant, it is altogether likely that both the contestants will seek with earnestness to win.

It is to be regretted that a law affecting so large and varied interests should be so worded as to leave any doubt as to the meaning and intent aimed at. Certainly the Code as it now stands cannot be made to harmonize with its four several and separate propositions, as reviewed in the July, 1880, number of this journal.

The Detroit "Free Press," in the columns to which its "funny man" is not allowed access, speaks its mind as follows:

"It would seem as though something should have been learned from our experience with wooden pavements; but there is nothing in public or municipal action to show it. Year after year the Board of Public Works goes around ramming new blocks into interstices in the oozy, half-rotten pavements, and calls it repairing. Year after year citizens who have postponed and fought off repaving, until the streets in front of their property are mere filth holes, half filled with rotten splinters, petition for renewed pavements of wood. And year after year the council orders such pavement. Nothing, probably, but the pestilence so recklessly invited will put a stop to the evil.

"Yet there ought to be wisdom and foresight enough to lock the stable door before the horse is stolen. It would be far wiser, better, more economical in every way, to stop the wood paving now, than to wait until driven to it by the dire consequences of outraging sanitary laws."



Uses of the Steel Square.

San Francisco can, we think justly lay claim to being considered the largest wooden-built city in the world. This fact has not been caused by the absence of quarries of granite or other materials suitable for building, but to the large expense it is necessary to undergo in order to get such materials to the city, and the high rate of labor in placing the more durable materials in buildings.

Outside of our fire limits there are but very few brick buildings erected. Even our bonanza kings, with all their wealth, used wood in the construction of their mansions. Necessarily, wood being so universally used, many improvements in framing have been adopted, and it is to these that we will devote part of our attention in the course of the next few articles, while we consider the subject of the *balloon* construction of buildings.

The older heads may say, "What do we care for balloon framing?—We knew that years ago." All right; but there is many a reader of this journal who does not know the *science of framing* even the simplest building; and we think many of the bosses themselves, if called upon to state why timbers for certain places have to be of a certain size in order to sustain certain weights, and the rule for such sizes, would be at a loss to give the information.

Many of our distinguished men have spent years of their time in experiments upon the weight necessary to crush timber, and the result has been such that an architect or master builder can at once give the necessary size of any timber to occupy the space, and be equal to the demands made upon it in order to safely carry the load with which it is intrusted.

From the experiments of one of these men, we find that no pressure less than that which would absolutely crush it would cause a square post to bend, when its height is less than about eight times the size of its base. "The resistance of timber to crushing seems to increase in a higher ratio than that of the area of its section."

It is difficult to give the exact weight that will be necessary to crush a cubic inch of any given kind of wood. Many scientific men have spent much time in experimenting on the subject, and we give below the results of their labors. We do not propose to give a table of all the different woods, with their respective tensile and lateral strength, but will confine ourselves to Oregon or Mendocino pine, as that is the wood that is generally used on this coast for joists, girders, and posts. At the time of the building of the Central Pacific railroad, some of the "section bosses" spent their wintry days and evenings experimenting in a rude way on the weight that a cubic inch of pine would stand without being crushed. One of the "bosses" gave us the following information: A cubic inch of pitch pine when loaded with railroad iron was split all to pieces with a weight of 2,100 pounds. A piece of Mendocino pine, perfectly straight grain, was crushed with 2,300 pounds. One piece was splintered with 1,800 pounds.

According to the experiments of Mr. Rondolet, a force much greater than the above was necessary to produce the same results. Mr. Rennie's experiments gave a much less figure, 1,606 pounds being found sufficient to crush a square inch. Du Hamel and Buffon spent much time on this subject, but no two give the same figures. All these experimenters used picked wood, dry and straight grained. Of course much less satisfactory results would follow by using the average quality of wood, with knots and cross grain running through it. We will have occasion in the near future to revert to this subject again.

The *tensile strength* of timber is a load such timber will bear with safety *with the grain*, or lengthwise. The *lateral strength* is the load such timber will bear sideways, or *across the grain*.

To find the *tensible strength* of timber, that is, the *safe* load it will carry, use the following rule: Multiply the area of the piece of timber, in inches, by the weight that is capable of crushing a square inch of the same kind of wood, then one-fourth of the product will give the load, in pounds, that the piece would bear with safety.

Timber that in length is over ten times the side of the section will bend before it is crushed. Therefore the above rule will only apply to timber whose length is to its base in above ratio.

To find the *lateral strength* of timber: Multiply the square of the perpendicular by the horizontal, in inches, at the center, and that product by 600; then divide by the length, in feet, and the quotient will be the load, in pounds, at the middle of the timber.

This rule applies when the timber is loaded at the center. Of course the stick will support a much greater load if it is placed nearer one end. In that case, the strain will be in proportion to the product of the two ends of the stick, measured from the point where the load rests.

By following these rules, the beginner can readily determine the necessary sizes of girders and posts to be used in the construction of a barn where a large amount of hay is to be stored, or of a warehouse where large quantities of merchandise are piled. Illustrations of the rules applied to various kinds of buildings will be given as we proceed with these articles.

For the present we will confine ourselves to the difficulties, and the solution thereof, usually encountered by the younger members of the trade. TRUE AND SQUARE being the watch-word we advised our young friends in a former article to follow, we will endeavor so to have our work from the start. See that your rough or mudsills are level across the grain. This is important, as it is necessary for the posts to set square on the mudsills, and if the latter are not level, the post cannot set square upon them. It is better to have a block under each post with the grain crossing that of the mudsills, these blocks to be nailed well to the sills. In case the ground is uneven, or has a heavy pitch, the sills should be kept level in sections. The first sill put in should be level, and the second one should either drop down or be raised (according to the ground) just as much space as is necessary to keep the second piece level. Care should be taken to let the ends of the sills run by each other, and the space between should be filled with suitable material.

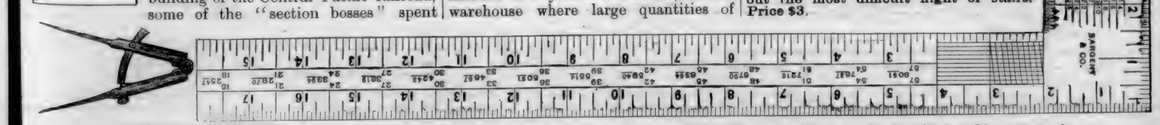
As much care should be given in placing the proper size of timbers for the mudsills as for any other portion of the building; and it is just money thrown away to place in foundation timbers that are in the least affected with the dry rot, or with streaks of sap running through them. The latter soon becomes decayed, and the weight of the building causes the posts to sink in the wood as it decays, and in a little while the building or barn begins to lean, and only waits the lapse of a few years to become a delapidated building.

In our next issue we will give a sketch of a "balloon" building, showing the proper way such a structure should be erected; also giving the various sizes and quantities of the timbers to be used, and the reasons why such sizes were placed in the various positions.

Mechanics who desire to become proficient in the art of framing should at once possess themselves of a copy of that splendid work, The Science of Carpentry Made Easy. Price $5. 1882 edition.

We have also just received Gould's Carpentry, combined with his celebrated Steel Square Problems. Price $3. 1882 edition.

Gould's American Stair Builder's Guide is a work that is especially adapted to those who do not know it all, but are willing to commence at the beginning, and end by finding themselves possessed of information which will enable them to lay out the most difficult flight of stairs. Price $3.



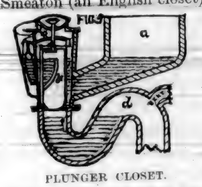
This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

Dwelling-House Sanitation.—IV.

BY GLENN BROWN.

"Pure air, pure water, and a pure soil."—HIPPOCRATES.

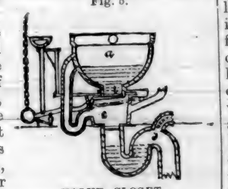
Of the plunger closets there is a large number in the market, differing only in the detail of their parts, all having a plunger (Fig. 4, *b*), which holds a large amount of water in the bowl (*a*), and when this plunger is drawn up the water is let out of the bowl, thoroughly flushing and washing the traps, soil and drain pipes. We name among the more prominent of this style of closet, Jennings, Demarest, Adie's, and Smeaton (an English closet).



PLUNGER CLOSET.

Fig. 4 is a sectional view of the Demarest closet, it being one of the best of the above-named class. The good points in this style of closet are that it retains a large amount of water, which in its discharge carries off all the fecal matter, also thoroughly flushing the drains, forcing down any gas that may be in soil-pipes, and not letting it into the house; but its defective points are in the closet itself. The large chamber (*c*), which contains the plunger, overflow valve, and hand rod of the plunger, becomes foul in a short time. The plunger (*b*) and the other portions of this chamber (*c*) become coated with a foul decaying matter, that breeds the very germs and generates the gas which forms a medium for the germs, that very it is desirable to keep out of the house. This apartment is also carefully concealed, and requires a plumber to open and clean it.

Fig. 5.



VALVE CLOSET.

Fig. 5 shows one of the valve closets, which has to have such nicely adjusted parts that they are liable to get out of order. Hair, paper, a string on the valve (*b*), or sediment might even thus keep the valve open, allowing the water to escape from the bowl (*a*), and permitting the gas to come into the rooms from the space (*c*) between the tap (*d*) and the bowl. This space (*c*) in position, and in being a chamber where foul matter can collect, somewhat resembles the cesspool (Fig. 3, *c*) in the pan closet. Both the plunger (Fig. 4) and the valve closet (Fig. 5) usually have water seal traps (*d*), and the plunger or valve portion was patented with the idea that a water-trap was not effectual in preventing the harmful parts of sewer-gas from entering the house. Quite recently, however, it has been conclusively demonstrated that sewer-gas does not pass through a water seal to an injurious degree, and that the organic germs in sewer-gas will never pass through a water-trap. Dr. Neil Carmicheal of Glasgow, Scotland, draws the following conclusion from his experiments: "Water-traps are, therefore, for the purpose for which they are employed, that is, for the exclusion from the house of injurious substances contained in the soil-pipes, perfectly trustworthy."

Quite recently a new class of closets have been put into the market. These closets have no mechanical valve or plunger, but they are so arranged as to keep the bowl partially full of water; and having their supply from a tank or cistern, are readily flushed.

The "Brighton," manufactured by Henry C. Meyer, New York, and the "Tidal Wave," manufactured by Henry Huber & Co., New York. Taking the Brighton as a type of this class, we find it has a small amount of water retained in the bowl, so as to keep the porcelain from becoming foul. Fig. *a* is a section of this closet.

The Dececo closet, recently designed by Col. George E. Waring, and put in the White House in Washington, so as to have a syphon action emptying the bowl at each discharge. See Fig *b*.

Those closets have scarcely been in use long enough to enable us to judge properly of their merit; but it is quite a stride in the right direction, getting rid of mechanical valves. Another

Fig. a.

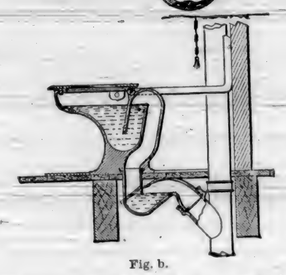


Fig. b.

recent improvement is a flushing rim, which may be made on any style of closet. This rim supplies the water to all parts of the bowl at the same time.

The advantage of a simple short hopper closet (Fig. 2), made of porcelain, with a porcelain ventilated trap, lies in its simplicity, and therefore it is not liable to get out of order. Its whole surface (Fig. 2, *a*) above the trap (*d*) is readily accessible to any one, and is thus easily washed and kept clean just where cleanliness is most needed—inside the water-trap. The large supply of water from the tank (Fig. 2) empties the trap, and thoroughly washes the soil and drain pipes. By obtaining these important points in this closet, and by the proper ventilation of the soil and drain pipes as described before, we have the most effectual mode known, at the present state of sanitary science, for preventing sewer-gas or causative germs from entering our homes. In this connection, it cannot be too well remembered that the thorough washing of the bowl with soap and water is all-important; as otherwise a sediment will collect, which is both offensive and deleterious.

Where urinals are used they should be made of porcelain, and have slate floor, with slate sides, to the compartment. A good substitute for urinals in a private house is the slop-dish, or pan, made by J. L. Mott of New York, placed directly over the bowl of the water-closet, the seat being made to lift up. Soap and water should be unsparingly used on all urinals.

A water-trap is an appliance with a water-seal, connecting water-closets, wash-basins, bath-tubs, etc., with the soil and drain pipes, so arranged as to prevent the ingress of sewer-gas to the house. Traps are made of lead, iron, plain, painted, and enameled, and of porcelain (Fig. 1, *c*). Lead traps should not be used, from reasons already stated in the account of lead pipes, and also for the reason that they are liable to have holes punched into them by servants, if they should become stopped. Porcelain or enameled iron ones are the best; but plain or painted iron ones should be preferred to lead.

Where traps other than S-traps (Fig. 6) have been used, such as the cylindrical (Fig. 8), or D-traps (Fig. 8), which are larger than the pipe running into or from them, it has been found in practice that all portions of the trap in excess of the amount of water flowing through them fill with putrefactive matter, and really from the S-trap (see Fig. 7). These traps, containing a large amount of water, were made so the water in them would not be withdrawn by suction or syphonage, which result is accomplished by ventilating the S-trap, as shown in the cut (Figs. 6 and 7).

The vent also carries off the gas that may be generated in the drain-pipes, or other parts of

Fig. 6.

S TRAP VENTED.

Fig. 7.

HALE S TRAP VENTED.

the drainage system. The S-trap is the best trap for use under all fixtures requiring them, if the trap is ventilated to prevent syphonage; but where there is not a ventpipe to the traps, these small traps are in constant danger of losing their seal by syphonage, and a trap with a large body of water having a screw attachment so it could be cleaned out when necessary.

Fig. 8.

CYLINDER TRAP.

Bowers' patent trap is probably the best in a case of this kind. The lower half is made of glass, and unscrews, so it can be easily seen and cleaned. (Fig. 9.) The ball used in it may be considered almost an excessive precaution, since it has been proved the causative germs would not pass through a water seal trap.

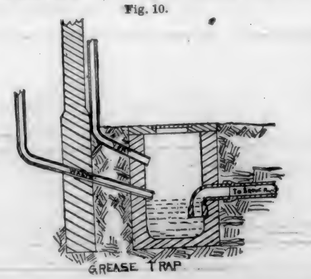
Fig. 9.

BOWER'S PATENT TRAP.

Sinks should have a large grease-trap, with water and gas tight cover, that can be easily removed, where the grease would collect and be taken out. Grease which is in the water is deposited in the pipe or trap as soon as it becomes chilled.

Some good sanitarians insist upon a grease-trap outside the house, as the water is more certain to deposit its grease from the difference of the temperature inside and outside the house.

Fig. 10.



A trap of this kind should be made according to Fig. 10, with a man-hole for cleaning it out. Bell-traps (Fig. 11) should never be used as they often are in cellars and areas, as their water seal is so slight that the water evaporates in a short time, leaving the sewer-gas free access to the house. In the country where it would be difficult or impossible to have a water supply, sub-soil irrigation, with earth-closets, is the best management. Concerning this mode of treatment, Col. George E. Waring, Jr., says: "Still sewerage can be safely depended on in a village or rural establishment when there is sufficient amount of lawn or garden to absorb the waste by underground irrigation, beginning at a point sufficiently far from the cistern or well. Disposed of in this way, and made to feed a vigorous vegetation, all the liquid matter of the house may be safely treated, by a small lawn or garden combined, with earth-closets."

Fig. 11.

BELL TRAP.

Cesspools should never be allowed where we obtain our drinking water from wells or pumps, as the well and cesspool are apt to be connected by natural conduits or by filtration through the soil, thus contaminating our drinking water.

Cleanliness has an important part to play in house sanitation. The bowls of water-closets, urinals, as well as the parts under the seats, should be frequently and thoroughly cleaned with soap and water. For this purpose the fixtures and appurtenances should all be readily accessible. Rubbish, decayed animal or vegetable matter, or anything of that kind, should never be allowed to remain in the cellars; cellars should, on the contrary, be kept rigorously clean, and also properly ventilated, to take off any dampness or foulness which it might be impossible to exclude in any other manner.

Deodorizing and disinfecting properly belong to house sanitation. Bad smells do not necessarily indicate dangerous gases, but are a sure warning of danger that will follow.

In purifying our homes, we must be careful to use something which will not only destroy bad smells (a complete deodorizer), but which will also destroy the dangerous emanations that are likely to arise from the same source. Chlorine and its compounds are deodorizers. Copperas is an excellent deodorizer, and also a disinfectant. Being cheap and readily procured in any part of the country, it is one of the best substances to use for the above purpose.

Deodorization and disinfection must only be relied on in case of need; the real source of the trouble should be gotten rid of as soon as possible; with everything in a proper condition of cleanliness and ventilation, there would be no need of deodorization or disinfection.

We would finally advise all who have homes, and wish them arranged properly in a sanitary point of view, to call in a competent architect and sanitary engineer. Without such assistance, they must not expect to have their homes in a proper sanitary condition, more than they should expect a broken arm to knit and heal in good condition unless it has been set by a competent surgeon.

An Important Publication.

The *Northwestern Lumberman* of Chicago is now engaged in the compilation of a new directory of all the saw mills in the United States and Dominion of Canada, which stupendous undertaking it expects to have completed in December next. The event will be signalized by the publication, in January, 1883, of a mammoth extra number of the *Lumberman*, which, its publishers claim, will be the largest single copy of any trade journal that has ever been published; it will contain about two thousand pages, and it is now announced that an edition of thirty thousand copies will be printed for distribution among lumber and mill men all over the world.

An edition of twenty thousand was first announced, but the publishers assure us that the number of saw-mills developed by their canvas thus far so greatly exceeds their expectation that the extra ten thousand copies will be required to cover the ground over which they intend to distribute this mammoth number. Besides the list of saw-mills, which will be printed in full, this extra will contain the *Lumberman's* Tenth Annual Review of the White Pine Lumber and Shingle Product of the Northwest, giving the production in detail of each saw and shingle mill, with comparative statements showing the amounts of lumber and shingles manufactured each season for ten years, with stocks of logs and lumber carried over at the close of each season, etc. It will also contain carefully drawn plans, elevations and specifications for the construction of model saw and planing mills, showing all the improvements made in mill architecture, construction and arrangement of machinery, with illustrations of all the latest improvements in the way of machines for sawing and dressing lumber. The new directory will also be published in book form, and besides the name and post-office address of the owner or operator of each mill, will give its average daily capacity, whether run by steam or water power, and the kind of lumber manufactured. The list will be arranged in alphabetical order by States, Territories, and Provinces, with the towns also arranged alphabetically in each. The price of the book has not yet been fixed, but will be announced in due time; advertisers who desire to avail themselves of the opportunity to reach all the saw-mills at once, presented by the *Lumberman's* mammoth extra, will do well to secure space at an early date.

The Blue Process of Copying Tracings.

As we have had several inquiries recently in regard to the best method of copying tracings by what is known as the "blue printing process," we will give a brief description of the method employed by us; we do not say it is the best, but it certainly is as simple as any other, and has always given us perfect satisfaction.

The materials required are as follows:

1st. A board a little larger than the tracing to be copied. The drawing-board on which the drawing and tracing are made can always be used.

2d. Two or three thicknesses of flannel or other soft white cloth, which is to be smoothly tacked to the above board to form a good smooth surface on which to lay the sensitized paper and tracing while printing.

3d. A plate of common double-thick window glass of good quality, slightly larger than the tracing which it is wished to copy. The function of the glass is to keep the tracing and sensitized paper closely and smoothly pressed together while printing.

4th. The chemicals for sensitizing the paper. These consist simply of equal parts, by weight, of citrate of iron and ammonia and red prussiate of potash. These can be obtained at any drug store. The price should not be over 8 or 10 cents per ounce for each.

5th. A stone or yellow glass bottle to keep the solution of the above chemicals in. If there is but little copying to do, an ordinary glass bottle will do, and the solution made fresh whenever is is wanted for immediate use.

6th. A shallow earthen dish in which to place the solution when using it. A common dinner plate is as good as anything for this purpose.

7th. A brush, a soft paste brush about 4 inches wide, is the best thing we know of.

8th. Plenty of cold water in which to wash the copies after they have been exposed to the sunlight. The outlet of an ordinary sink may be closed, by placing a piece of paper over it with a weight on top to keep the paper down, and the sink filled with water, if the sink is large enough to lay the copy in. If it is not, it would be better to make a water-tight box about 5 or 6 inches deep, and 6 inches wider and longer than the drawing to be copied.

9th. A good quality of white book-paper.

Dissolve the chemicals in cold water in the following proportions: 1 ounce of citrate of iron and ammonia, 1 ounce of red prussiate of potash, 8 ounces of water. They may all be put into a bottle together and shaken up. Ten minutes will suffice to dissolve them.

Lay a sheet of the paper to be sensitized on a smooth table or board; pour a little of the solution into the earthern dish or plate, and apply a good even coating of it to the paper with the brush; then tack the paper to a board by two adjacent corners, and set it in a dark place to dry; one hour is sufficient for the drying; then place its sensitized side up, on the board on which you have smoothly tacked the white flannel cloth; lay your tracing which you wish to copy on top of it; on top of all lay the glass plate, being careful that paper and tracing are both smooth and in perfect contact with each other, and lay the whole thing out in the sunlight. Between eleven and two o'clock in the summer time, on a clear day, from 6 to 10 minutes will be sufficiently long to expose it; at other seasons a longer time will be required. If your location does not admit of direct sunlight, the printing may be done in the shade, or even on a cloudy day; but from one to two hours and a half will be required for exposure. A little experience will soon enable any one to judge of the proper time for exposure on different days. After exposure, place your print in the sink or trough of water before mentioned, and wash thoroughly, letting it soak from 3 to 5 minutes. Upon immersion in the water, the drawing, hardly visible before, will appear in clear white lines on a dark blue ground. After washing, tack up against the wall, or other convenient place, by the corners to dry. This finishes the operation, which is very simple throughout.—*The Locomotive.*

Flats, or Apartment Houses.

The building of flat or apartment houses, occupied by all the appurtenances of many families under one roof, must go on in increasing ratio with the immense rise in the value of real estate, and consequent increase of rents in our most populous cities; and no form of structure will more tax the ingenuity of the architect, and probably be of more importance in the near future, than these. In this country they are as yet comparatively new, but already some very obvious defects have become the subject of complaint. Of these the most serious is the difficulty of securing anything like ventilation for the interior rooms. To light them well is probably out of the question, under such conditions as prevail in this city, and as yet their ventilation cannot be considered to have been satisfactorily dealt with. The close, stuffy smell of the hallways and inner rooms of even high-priced flats in the middle of blocks is familiar to every one. To get exposure directly to the outside air is impossible, and the comfort of the flat must depend on the architect's skillful arranging of his make-shift air shaft, and the rooms which must necessarily depend on this "hole in the wall" of two adjoining houses for such little ventilation as they can receive. In London the bad condition of apartment houses in this respect has led to comment by the *Lancet*, which is of the opinion that the most redeeming feature about living in flats, from a sanitary point of view, is that the families occupying them do not often have children to suffer from the unwholesome atmosphere. In this aspect, the objection of landlords to children may after all be a blessing in disguise to the tenant.—*Sanitary Engineer.*

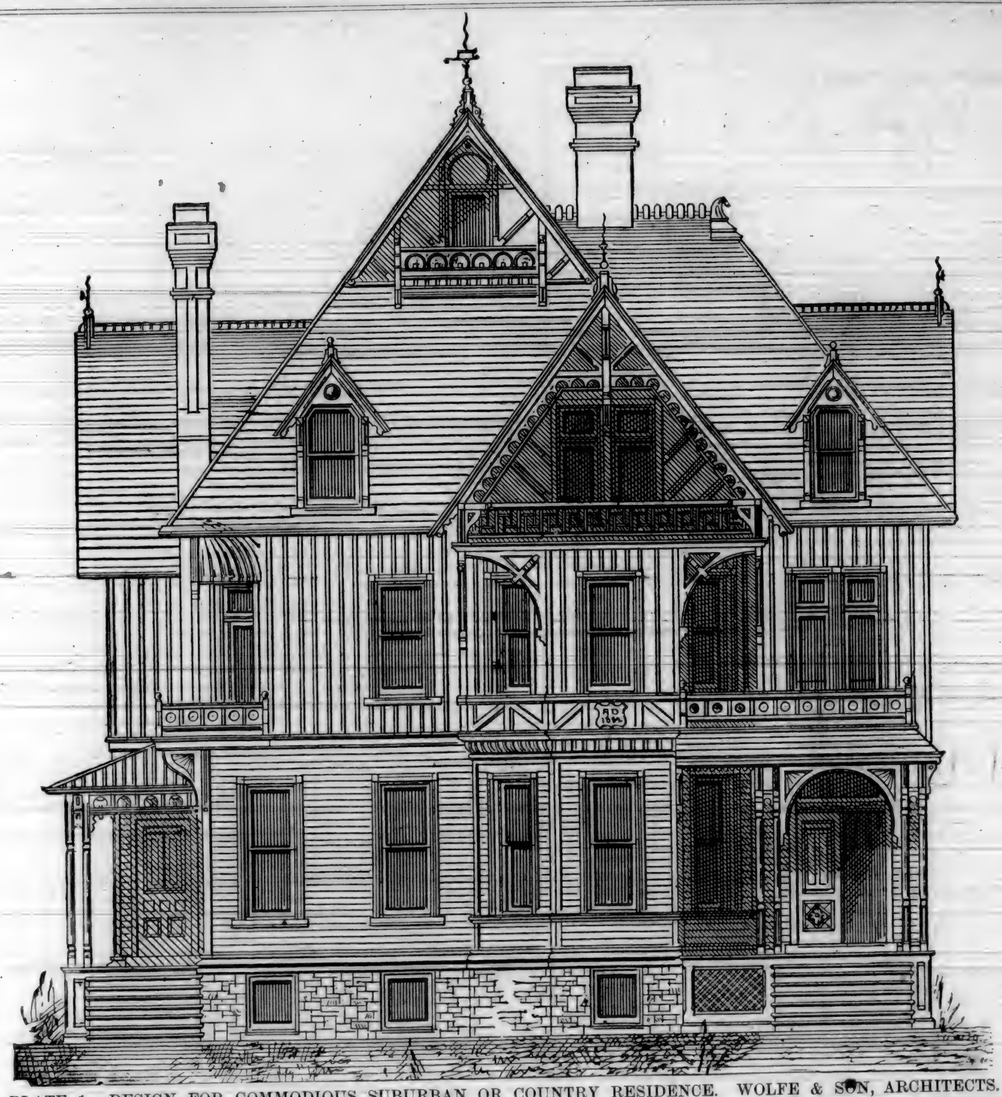


PLATE 1.—DESIGN FOR COMMODIOUS SUBURBAN OR COUNTRY RESIDENCE. WOLFE & SON, ARCHITECTS.

Practical Lessons in Architectural Drawing.

The scheme adopted in this work is to select more or less simple examples in the several classes of construction—frame, brick, and stone—and by carefully working out the drawings in the order in which they are required in actual building, and by explanations in the adjoining text, to put the work in such shape that it can be readily understood and comprehended. The examples have been given a varied character, in order that as many different ideas as possible may be illustrated. The last chapter deals with the coloring of architectural working drawings, and is illustrated by a plate in colors. Sent post-paid to any address, upon receipt of the publisher's price, $2.50.

Palliser's Details.

REDUCED TO $2.00 PER SET. The authors are determined to close out their present lot of Details, as they intend to move to New York city. In conformity with orders to take effect after August 1st, 1882; we have reduced the price; post-paid to any address, upon receipt of $2.00.

American Cottage Homes.

REDUCED TO $3.00. On account of the publishers changing the location of their business, they intend to clean out effectually all their stock on hand. To do this, they have REDUCED THE PRICE OF THEIR COTTAGE HOMES TO $3.00. Will send a copy to any address, upon receipt of the price.

Practical Lessons on the Science of Carpentry.

A work that every mechanic should have. It is designed to make the science and art of carpentry clear and comparatively easy to all who require information on the subject. This book is also of use to all who have barns, bridges, and outhouses to build, and require information how to accomplish the work. Sent post-paid to any address, upon receipt of $5.00.

In Germany, sawdust is combined with glue, or some other intensely adhesive material, to form a plastic mass from which are wrought door-knobs, piano-keys, and a variety of objects.

☞ **Science of Carpentry Made Easy, $5.00.**

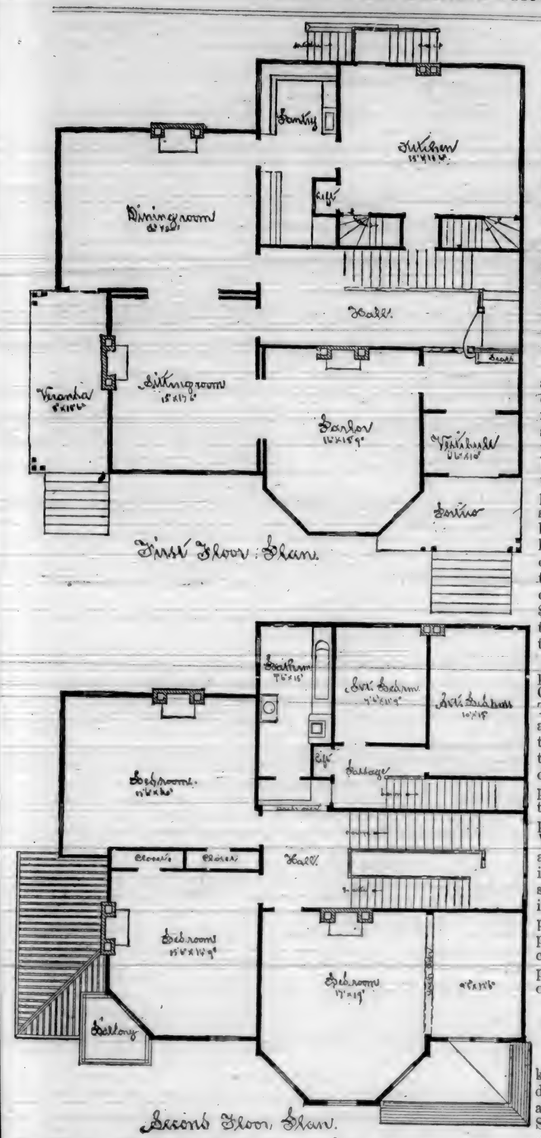

PLATE 2.—GROUND PLAN FOR SUBURBAN RESIDENCE.

Our Illustrations.

Plates 1 and 2 are the plans and elevations for a very desirable country or suburban home. The arrangement of rooms for persons who receive much company is admirable. It will be noticed that the three principal rooms on first floor can readily be thrown into one room. The cost of such a house can be made to vary from $8,500 to $15,000. If built according to the design, and painted according to the more modern and advanced ideas, its appearance will be very artistic and striking.

Plate 3 is the elevation and plan for a beautiful country residence. The arrangement of the rooms is specially convenient. A servant can answer the door-bell, and not disturb anything going on in either parlor or dining-room. A servant's room could easily be added on by making the kitchen part 1½ stories high; or by building on a room at the end of the kitchen. Its cost may be put down from $3,500 to $5,000, according to the height and finish of the basement, etc.

We have received a fine plate from the Mechanical Company of New York. Their work is very nice; and if the drawings furnished them are such as they ought to be, they guarantee to produce as fine cuts as any process now in operation in the United States. Their prices are very reasonable. We regret that we are unable to present their engraving in this issue, as we are so crowded with matter that is of so much interest to the profession and business men, property owners and mechanics, that we were compelled to leave their plate over till next issue.

Francke's Monuments.

A superior work of its kind. Designs for every description of monuments and tombstones. Price $9. Sent post-paid to any address on receipt of the price. Large size, 12x18 inches.

Proposed Plumbing Law for California.

A movement in the right direction is at last being made by the more worthy class of plumbers in San Francisco. We have earnestly endeavored through the columns of this journal to awaken an interest in this matter, and we are glad to notice the movement inaugurated. We have been shown a form of a plumbing law for this State, similar to that of New York, which works well. The object of the proposed law is to empower boards of health to control, by approval or rejection, the plumbing and drainage works of buildings generally. It is hoped to secure the passage of the law by the next legislature, and through its protective provisions surround the plumbing business with safeguards calculated to secure the community against the terrible effects of sewer gas, which has sent so many thousands to untimely graves. The matter is being managed by those who understand its importance, and who have no other special object or motive in view than the public welfare, and to restrict the operations of that large class of so-called plumbers, who understand nothing correctly about sanitary principles or decent workmanship, and who have, at least indirectly, been instrumental in imposing the sorrows of sickness and death upon innocent multitudes.

Supplement to this Journal.

On the first of this month we issued an edition of 15,000 copies of a Supplement to the CALIFORNIA ARCHITECT AND BUILDING NEWS. In size it is 26x38 inches, folded into four pages, 19x26. We have given a goodly number of illustrations and ground plans of country and suburban residences in different styles of architecture. It is interspersed with entertaining matter, and will no doubt receive due attention from those into whose hands they may fall.

The object of the Supplement is to inform those who have not seen our regular monthly publication that we have, after a struggle of nearly four years, succeeded in placing upon a sure and paying foundation an architectural and mechanical journal that will, we hope, in the near future, be without a peer in the United States.

In order to accomplish our ambitious aspirations, it is absolutely necessary that our subscription list be increased to a number that is represented by the figures 25,000. This can be accomplished if we receive subscriptions from but a part of those receiving the Supplement. Should any one be so unfortunate as not to receive a copy of the latter, we will immediately mail them one upon notification.

A few slight errors crept into the columns of the Supplement, one of which we regret. We gave a list of the principal architects of San Francisco, with the location of their respective offices. We inadvertently missed Mr. A. P. Moore, 330 Pine street. Mr. Moore is treasurer of the San Francisco Chapter of Architects, and is universally esteemed for his social as well as his professional character. Mr. P. J. O'Connor should also have appeared in regular order, with place of business, 640 Market street. We by no means intended to do injustice to either gentlemen.

In our Supplement we did not insert a single paid advertisement. We devoted the space entirely to forwarding our claims upon the community, and endeavoring to show why a journal of the character of this should be supported by every architect, mechanic, and property owner in the State.

In a short time we will issue

☞ SUPPLEMENT No. 2. ☜

We guarantee an issue of 25,000 copies. A limited number of advertisements will be received. We positively will make no deviation from our rule; viz., *No advertisements received except those which strictly belong to the building interest.*

We intend a copy of Supplement No. 2 shall be sent to every *bona fide* property owner on the Pacific Coast, as well as every architect, mechanic, contractor, etc. Advertisers will see at once the great benefit that will result to them by securing a space in this mammoth edition. No such opportunity has ever been offered in California to place your wares and inventions before the people that use them.

The Supplement will consist of eight pages, in size 16x23½. Each page will be divided into four columns. A square will be the space of one inch by the width of the column, 3⅛ inches. For terms, address the business manager of the journal.

Indexed Atlas of the World.

But one copy remains of this magnificent work. They are not for sale in any bookstore, and it is but seldom that a copy can be had. This last copy is bound in half-morocco, and will be sent post-paid upon receipt of the price, $35.

☞ **Subscription price of this journal is $2.00 in advance.**

Farm Architecture: Houses and Barns.

BY E. C. GARDNER.

(Extracts from a lecture delivered at the annual meeting of the Massachusetts Board of Agriculture. Take the lecture as a whole, it is the spiciest, most entertaining and instructive that we have read for some time. Mr. Gardner has had it printed in pamphlet form. A copy can be had by forwarding 15 cents to E. C. Gardner, Holyoke Mass.)

Farm architecture, in its essentials, is precisely identical with all other domestic architecture the world over, from London to Kamtschatka, from the Aleutian Islands to Patagonia. It is building the shell that incloses and protects the family. It is a matter of common sense—of evolution, if you please. . . . .

Before setting out upon the hard, uninteresting turnpike of practical details, let me refer to a familiar and most significant fact. We read of people who awake some fine morning and find themselves famous. We Americans awoke a short time ago and found ourselves artistic, or, at least, enthusiastically determined to become so. Cheap chromos led the procession, and now fill the air as the painted leaves fill the woods in October. Dadoes and drapery demand our admiration. The stork is abroad in the land; Eastlake corners and angles assert their rectitude; white china is dismissed in disgrace, not because it shows dirt, but because it does not show peacocks' plumes, butterflies, and poppies. House and sign painters are exhorted to compound impossible hues for the outside of our buildings. Freehand drawing has become a part of public instruction; and the boy who, when we were young, would have been whipped for making pictures on his slate in school-time, and caricaturing the master on the fly-leaf of his "Webster's Speller," is the favorite pupil, specially detailed to embellish the blackboard for examination-day with his sketches.

Farmhouses and barns in their architectural study must be separated into two classes: those already built, those which are to be built—the old and the new; the former being, perhaps, the most important, certainly the more numerous. The average New England farmer clings

AN EARLY SETTLER.

to the delusion that it is impossible to make two farms of one by short division. It does not occur to him, if, happily, he has two sons, that he may assign the old house to one of them, build a new one for the other, and when he dies divide his acres equally between the two. He has found it hard to get a living from the whole farm; how, then, shall his sons support themselves and their extravagant, artistic wives from half of it? As a rule, the sons prefer to support themselves and their artistic wives in some other way, and will accept neither the old house nor the new.

AN EARLY SETTLER RENEWED.

Still, for the sake of the argument, we will suppose that the cards are out, the cake baked, and both the old house and the new in eager demand. With due respect to age, we will consider the old house first, beginning, where we usually begin in making acquaintance, with the outside. On this point, the external appearance, there will be more to condemn concerning the new than the old; for the old farmhouse is commonly a picturesque object. Architecturally viewed, its general form and composition are satisfactory, for the simple reason that the man who built it knew what he wanted, built what he wanted in the simplest fashion, and then stopped.

AN OLD PURITAN.

The usual faults in the farmhouses of former years are the absence of porches (I wonder our grandmothers didn't catch their death-colds sitting on the stone door-steps when they came home from quilting and singing-school), the small windows and poor glass, the steep, narrow stairways, the low ceilings, and the dark cellars, not infrequently damp as well as dark. The latter is the most serious defect, the most difficult to remedy. If a house cellar is damp, persistently damp and moldy, tear the house down. Then build in a dry spot.

THE OLD PURITAN REVISED AND ENLARGED.

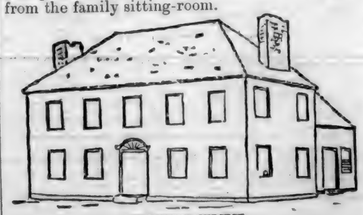
The absence of porches, and the ease with which they can be appended to the old house, has been suggested. But they need not be elaborate or fanciful; they should be generous in size. I am sorry for a house that tries to look hospitable and inviting by holding out a stingy little balcony four or five feet wide. Eight, ten, or twelve feet are none too much. But the wide piazza-roof must not be allowed to keep out the southern sun. Better omit the roof, if it stands on the south side, using a cloth awning for shade when needed. The morning and evening rays are glad to enter aslant beneath an overhanging roof; and a wide north veranda is a capital place for the noonday rest. To take out the small windows of poor glass, and substitute larger and better, is also a simple matter. The window of a house is like the eye of the soul. If it is single and clear, the whole house will be full of light and cheerfulness. The narrow stairs cannot often be improved, except by giving up a part or the whole of an entire room, as has been suggested; and the low ceilings need no improving, unless they are extremely low; indeed, just at present, low ceilings are the height of fashion.

Old houses are sometimes subjected to another indignity, against which we cannot too strongly protest. The old finish is torn out and made into kindling-wood, and the queer old moldings and flutings of the architraves, the bases, the wainscots and panelings, the chair-rails, ceiling-beams, and corner-posts, ruthlessly demolished. It is vandalism to destroy these honest, homely features. By all means let them stand. . . . . Above all things don't commit the unspeakable folly of filling up, burying alive, the old fireplace. If it is too large for the modern wood-pile, line it with fresh bricks (molded patterns cost but little more); and never make an apology for the high, stiff, old wooden mantel. Rather let us weep for our own stupidity if we cannot see and bring out the beauty it contains. The frequent superiority of these old members arises from the fact that they are the product of more thought and less machinery. The thought was not spread so thin. Hand and brain worked together then more than now.

There are several reasons why the first or principal floor of a house should not be too high up in the world. From the picturesque standpoint the lowly estate is decidedly preferable, especially as the underpinning is usually treated. But other reasons for keeping the living-rooms well above the surface of the ground are too important to be disregarded. A free circulation of air and plenty of light underneath the first floor are indispensable to the best sanitary condition. These can be most easily secured when at least half the cellar or basement story is above the ground. The porch and the main entrance hall may perhaps be upon a lower level. For warmth and dryness the cellar-wall above the ground, commonly called the underpinning, should be hollow—two thin walls of stones, of bricks, or one of each; which introduces the subject of materials.

A farmhouse should be the very type of stability, repose, completeness, and perfect adaptation to its condition and surroundings. For these reasons, I should say that a cheap wooden frame is not the best kind of farmhouse to build. A well-constructed wooden house is good; a well-built house of stones or bricks is better, and costs but little more.

Concerning the internal arrangements of farmhouses, only general suggestions can be given. Situation, size, and desired cost—the taste, needs, and aims of its occupants are conditions that vary indefinitely, and should be met with absolute directness and honesty. If the peculiarity of the situation requires the kitchen to be in the front corner of the house, that is the right place for it. If it makes the pantry next neighbor to the main stairway, that proximity should be accepted as best for both. The room or rooms most constantly used by the most important members of the family should be those which, all things considered, are most desirable for such occupation. But rank varies in different families. With some the highest consideration is given to the children, with others to parents, with others to visitors and rich relations. I should vote for the children. I think most housekeepers who, in common phrase, "do their own work," would like a kitchen to be light, sunny, and cheerful, with windows looking out upon the garden, orchard, or fields of grass and grain—not into the barn-yard or sink-drain—and a view of hills and and woods beyond. Even if the heavier housework is done by hired help, this room, which is the workshop, and in which the daughters of the house must serve their apprenticeship, if they would ever manage households of their own, should be as comfortable as possible, and not placed beyond easy access and oversight from the family sitting-room.



A PROMISING SUBJECT.

Truly, it is a serious question, one of the legitimate side issues in a discussion of the planning of farmhouses; for our home-life does depend to a wonderful extent upon the character and plan of the house we live in. If, for instance, there is one large, cheerful sitting-room, which contains all we have for general use in the way of comfort, beauty, luxury—a room in which the best thought and the best work of the household finds daily exercise and expression—it will soon be found that another room for any sort of company is a sheer waste of resources. On this great command hang all the law and the prophets of domestic architecture; our houses should be built to live in; not for show, not for company, not for fashion, but to furnish to the occupants the greatest amount of comfort and enjoyment all the time. Nothing should be so fine that it may not be seen and heard and enjoyed every day, nothing so poor and mean that we must hide it from our visitors. And it will follow, as the day the night, that the home which is most freely and largely enjoyed by its inmates will be the most delightful in the hospitality it affords to kindred and friends.

THE PROMISE FULFILLED.

The modern French roof—a fashion that, having nothing to recommend it, has already passed out of fashion—is interesting in comparison with its humble prototype, the old gambrel roof. Even with its scroll-sawed brackets and cast-iron cemetery-fence on the roof, it is less attractive than the old house, and not half as susceptible to improvement. Here, as in so many other things, the new fashions are greatly inferior to the old. Why not, then, imitate the old outright, it may be asked, if they are always better? They are not in all respects; and, moreover, in architecture, as in patent medicine, we should "beware of imitations."

THE "ITALIAN VILLA" IN AMERICA.

As we go out to the barn, let us look back at the house a moment to see how it is painted. We might profitably spend an entire evening in discussing color alone; we have only time for a hasty glance. To step at once upon absolutely safe and solid ground, and broad ground, too, we may say that Nature—who never utters discordant sounds, never makes a mistake in her colors, which are always elegant, always in the height of fashion—has an infinite variety, from the most brilliant hues that can be conceived to the rare, pale tints that no man can name or classify; and she uses them lavishly on her own work. She manifests her gentle spirit, and at the same time her unerring sense of fitness, by painting the works of human hands a quiet, unobtrusive gray, treating them kindly, harmoniously as far as possible, but never allowing them to wear such garments of color as she bestows upon her own perfect creations. She paints every fence and wood-pile, every roof and artificial stone-heap, every bridge, barn, and house, the same quiet gray. Still I do not think the good mother will resent our temerity if we sometimes humbly strive to imitate certain tints from her palette; always keeping on the safe side, and not attempting to outshine our teacher. She shows us many shades of gray, of brown, of olive, of maroons, and of umbers, as well as the warmer tints of drab and yellow. Even the good old Venetian red, with a broad frame and background of green, is not to be despised. Above all things, we should study her combinations; for a discord in color is as gross a violation of natural law as is a discord in musical sounds.

A FRENCH CHATEAU.

I omitted to speak of house-drainage, in order to bring the drains together, and will not now discuss the sanitary bearings of the subject—although in this respect we are but half civilized; our friends and neighbors are dying by the hundreds, of sewers, cess-pools sink-drains, and poisoned wells—and thousands more are half dead, but, keeping on the common ground of economy and thrift, I wish to remark that every sewer, cess-pool and waste-pipe, every barn-yard, pig-pen, and cellar, in which water is not absorbed as soon as it appears, is an intolerable nuisance, and a wicked waste upon a farm. It is so everywhere, but less inexcusable in villages, because the dwellers in town do not depend directly upon saving these raw materials of agriculture for their incomes, and to save them

TELESCOPIC ARCHITECTURE.

is more difficult. It is the special duty of farmers, of all men, to make two blades of grass grow where one grew before. To this end every particle and atom of these valuable volatile elements should be saved—saved by absorption. Water in the shape of drains and ditches, to convey these waste, or rather wasted, elements to some remote outlet, stream, or even a covered pit, to be cleaned out once or twice a year, or not at all, is a highway robber. If it can be compelled to distribute the sewage of the house precisely where it is needed, by sub-irrigation, that is a wise economy.

THE BIG END OF THE TELESCOPE.

It is a mistake to suppose that houses or barns or mills are any better for being piled one story above another. Unless land is worth many thousand dollars an acre, it is cheaper and better to keep the whole establishment as nearly as possible on a common level. The days when the farmer tied two pieces of wood together, and with that primitive implement pounded out a bushel of rye, put it in one end of a bag, with a stone in the other to keep the balance true, laid it across his horse's back, mounted the whole, and rode off to mill, are among the days that were. Farmers and their boys do not spend their evenings making flails, nor need they build "barn floors" to swing them on.

The farmhouse of the future will be built mainly of bricks and stones. It will be broad and not high. The windows will be large. Shade-trees will stand at a respectful distance, allowing the sun to rest upon it in healthful benediction. Each room will have an open fireplace, wisely contrived to give the greatest amount of heat and ventilation with the least consumption of fuel. A steam-boiler, which is only a scientific tea-kettle, will hold a slice of the summer months beneath the double roof all winter long. Sunshine and good cheer will prevail from cellar to attic, from outer court to innermost chamber. The roof will not leak; the chimneys will not smoke. Rats and mice will not raise armies and fight battles in its hidden cavities. The kitchen will be a workshop fully equipped, a studio in which the fine art of cooking will be learned and practiced. There will be a private room for every adult, and every child old enough to take care of a room. There will be a library full of books, and a sitting-room so cozy, so interesting, so homelike and charming, that the parlor, if there happens to be one, will be literally left out in the cold.

Co-operation, nineteenth-century inventions, railroads, telegraphs, and telephones are bringing us nearer and nearer together, are making us more and more dependent upon one another, upon mutual intelligence and good behavior. More and more it is the duty of every man and patriot to let the light of his life and of his home illumine the world, and leave it better that he found it.

San Francisco Chapter American Institute of Architects.

The regular meeting of the Chapter was held Friday evening, October 6th, J. Wright, Esq., presiding. It was very pleasing to notice the large attendance, and the general good feeling that was manifested in the discussions of the different subjects brought before the meeting.

Mr. W. G. Matthews was elected a Fellow member of the chapter. Mr. E. J. Molera and J. Gosling were proposed as members.

The committee appointed to investigate the matter of establishing classes for the tuition of articled students of the profession reported as follows. Several of our prominent scientific men have offered to teach classes in their several branches during the winter months. One of our most noted sculptors and modelers said he would take pleasure in giving lessons to the students in modeling. Another would give lessons in aesthetics. And in all the different branches professors have manifested willingness to devote one evening a week to the advancement of the articled students of the profession.

The students will see at once the advantage of availing themselves of the openings thus presented during the long winter months. There will be no charge in connection with these lessons. They are the outgrowth of the general good feeling that has been engendered by the formation of the San Francisco Chapter, and one of the legitimate fruits of the organization. Any information will be cheerfully given to any student, by calling on the Secretary, room 11, 240 Montgomery street.

A standing offer was made to the Chapter, tendering the use of a car free to the grand red woods in Sonoma County, the Chapter to go in a body and survey the wondrous beauties of nature. The offer was kindly accepted. The excursion to take place upon any time the Chapter may select.

Now is the time to subscribe for 1883. Send us $2, and we will send the numbers for the balance of the year 1882 free.

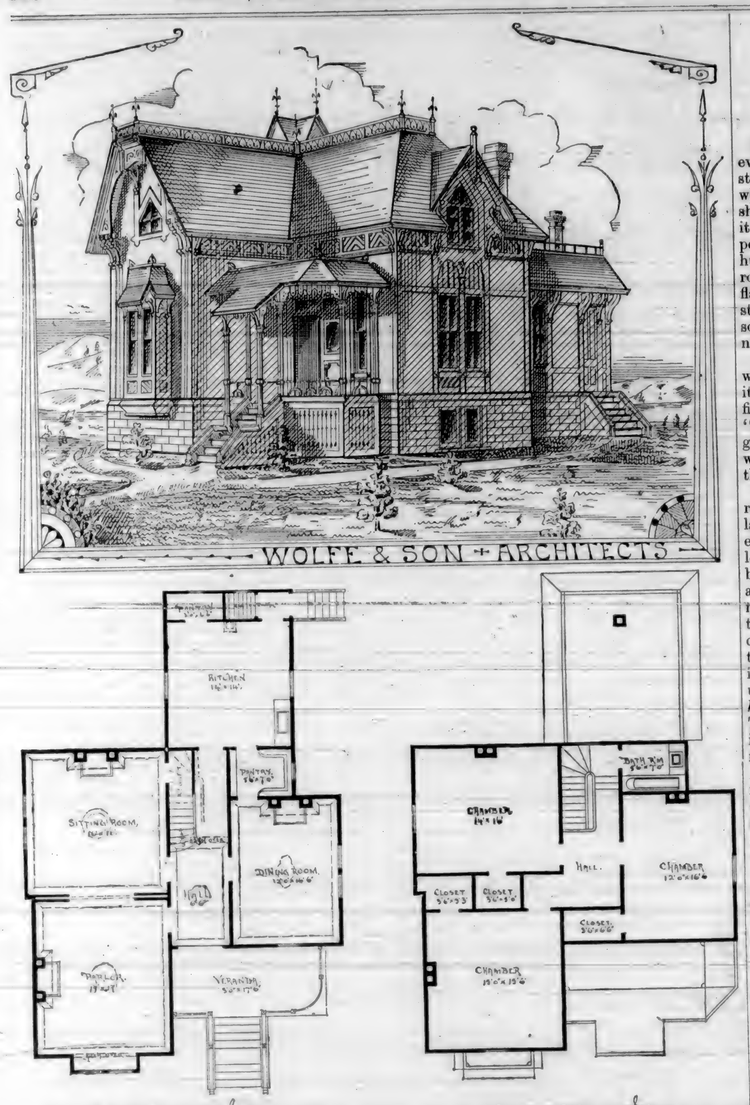


PLATE 3.—PLANS AND ELEVATION FOR COUNTRY HOME.

Priming for Oil Paint.

O. Kall, of Heidelberg, prepares a substitute for boiled oil by mixing ten parts of whipped blood, just as it is furnished from the slaughter-houses, with one part of air-slaked lime sifted into it through a fine sieve. The two are well mixed and left standing for twenty-four hours. The dirty portion that collects on top is taken off, and the solid portion is broken loose from the lime at the bottom, the latter is stirred up with water, left to settle, and the water poured off after the lime has settled. The clear liquid is well mixed up with the solid substance before mentioned. This mass is left standing for ten or twelve days, after which a solution of permanganate of potash is added, which decolorizes it and prevents putrefaction. Finally the mixture is stirred up, diluted if necessary with more water to give it the consistence of very thin size, then filtered, a few drops of oil of lavender added, and the preparation preserved in closed vessels. It is said to keep a long time without change. A single coat of this liquid will suffice to prepare wood or paper, as well as lime or hard plaster walls, for painting with oil colors. This substance is cheaper than linseed oil, and closes the pores of the surface so perfectly that it takes much less paint to cover it than when primed with oil.—*Deutsche Industrie Zeitung.*

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

Something about the Grindstone.

There are comparatively few persons that ever have had the pleasure of grinding on a stone that was properly *rigged up*. Let us see what kind of a *rig* we will find in the carpenter shop on the first farm we come to. Well, here it is. A stone of about fifty or seventy-five pounds, hung on a rickety frame, with treadle hung on a pivot, and shaft hung on four friction rollers, with two out of the four rollers worn so flat, that they will not turn. However, the stone turns "all the same," and reminds a person of an eccentric on a steam-engine; we find no water, no trough, and no dipping pot.

We will now go to the next shop, and see what kind of a *rig* they have there. Well, here it is: A stone rigged in all respects like the first, only this one has a trough, that would not "even hold potatoes"; here we find a man grinding a chisel, and a boy pouring on water which soaks into the dry stone about as fast as the boy pours it on.

Let us go into one more shop, and see the rig they have there. We find a stone not much larger than the first two. But, mark the difference in this *rig*: we see a stiff wide frame, long shaft with polished journals, running on babbit-metal, and a fly-wheel of about 130 lbs; also a large trough full of clean water; we also notice that the stone is all boxed up excepting that portion upon which the tools are held; consequently, if the stone is turned ever so fast, the water will not fly off onto the person grinding. We also notice an old hatchet lying under the frame, the use of which being to *hack* the stone occasionally on the *high* places. This *hacking* makes the stone cut much faster in those places, and consequently this stone did not remind us of an *eccentric*.

There is no economy in hanging a stone much smaller than three hundred pounds. This size does not need a fly-wheel. A stone much smaller than the above would need a fly wheel as much as a sewing machine or a cutting-off circular saw.

Perhaps a few hints on *power* grindstones would not be amiss. Grindstones should always turn *from* you (i. e., the top of the stone). They should always be *boxed* up, with no more of the stone exposed than is actually necessary. They should run in a trough of clean water. A *dipping pot* should never be used. The wetter and cleaner a stone is, the faster it will cut away the iron or steel.

Two hundred revolutions of a stone that runs as fast as the water will stay on it, will cut away as much iron as three hundred revolutions will if the stone runs very slow. Large stones should be geared down, or else have a long shaft, so that the pulley will be out of the way.

E. H. DAVIES, Santa Clara.

(We would be pleased to hear from Mr. Davies on the subject, how to pick out a perfect grindstone.

Now is the time to subscribe for 1883. Send us $2, and we will send the numbers for the balance of the year 1882 free.

PRACTICAL LESSONS

—IN—

ARCHITECTURAL DRAWING,

PRICE, POST-PAID, $2.50.

The Would-be Great London Light of Journalism.

We were surprised and yet somewhat amused in reading the preface to a bound volume of the *Illustrated Carpenter and Builder*, London, evidently penned by one who looked down upon "all the world and the rest of mankind," as but tributary to the greatness of the concern represented by his pen. A measurement of his head at the time might have proven an interesting item in physical science, as illustrating to what enormous dimensions that portion of the human frame may expand under certain conditions. He says—presumptuously assuming the *Builder* to be the fountain head of class journalism—"Another point of importance to which we must briefly refer is the establishment in America of *several* papers of a similar character to our own." This sentence portrays either a deliberate purpose to misrepresent, or inexcusable ignorance on the part of a would-be leading London class journal writer as to the actual state of facts made by him the subject of misrepresentation. For at the time the preface was written there were many journals published in America devoted to the various interests represented in the *Builder*, and the term "several" used in the preface was deceptive and misleading, as its proper significance means more than two, but not many. If truthfulness and fairness had controlled this London writer, he would have stated, while claiming great things for his own journal, that a considerable *number*, many times *several* American journals had, seemingly to him, imitated the London publication, and with truthfulness added, many of them equaling if not excelling us in interesting matter, editorial ability, and progressive skill and enterprise.

He further adds: "The old proverb that imitation is the sincerest of flattery seems to obtain in our case, since we find a *host* of imitators." Here the poor fellow cuts his own throat, for in this immediate connection he has stated that there were only *several* imitators, while now he finds them rising in host-like numbers before him. Editors should exercise at least a safe degree of precaution in the use of words when penning statements intended to impose upon the credulity of their patrons. *Several*, not many, and *host*, a large number, are not reconcilable when referring to the identical same thing. He then continues by saying: "From the *civilized* cities of the West, to (*uncivilized?*) San Francisco, from whence a copy of *an imitator* has but just reached us, and which contains one-third of one of our numbers. From city to city of the States they are finding out that the industries for which we have now long and successfully represented on this side are wanting in their newspapers in America." (The italicizing is ours; the language the *Builder's*.)

THE CALIFORNIA ARCHITECT AND BUILDING NEWS being the only journal ever published in San Francisco devoted to architectural building and sanitary sciences, it is fair to infer that the slur in the above quotation was intended for us; but if so, the absence of truthfulness is so emphatic that we are warranted in questioning every line of the preface, and regarding its statements of *asserted* facts as hypothetical in the broadest sense.

We have in nothing imitated our British contemporary. So far from it, our entire editorial and publication work was arranged, constructed, and put into execution long before we had so much as seen a copy of the London book. And as to any one of our issues containing "one-third of one of our (the *Builder's*) number" is concerned, the statement is simply a reckless perversion of facts, as our selections from its columns were infrequent, and never extensive. And so far as we may have extracted from its columns, we pursued the common practice of journalism throughout the civilized world, and a privilege which every journal published to a greater or less extent practices—the London light included. And whatever of privilege we may have availed ourselves of was paid for by us through a New York agency. But with the rapid increase of exchanges, which now number nearly if not quite three hundred, we found so many containing information and matter so much better adapted to our purposes, that after the first year we discontinued our subscription to the London work. We are not in the least disadvantageously affected because our contemporary is not among the number of our exchanges, as the facilities within ourselves are sufficient to enable the issue of our journal monthly, or daily if we wished, to the entire satisfaction of our patrons, without the aid of those who are capable of misrepresenting us. There are but few journals published in which a greater amount, proportionally, of original matter appears, and we are content to realize the fact that our editorial and publication work has been and continues to be a success, notwithstanding our demise as a publication might have been a source of exultation to our British contemporary.

One might reasonably suppose, from the tenor of the quotations under notice, that the journal in question was the light of the journalistic world, and that all others were but the lesser reflected luminaries of the great would-be London central publication. To imagine one's self so poised above all others of human kind or origin would, to the soul so diminutive and full of self-conceit as to indulge the thought, be a pleasant dream. But the London journal forgets that the stain—if such it be—of common humanity rests upon its garments, and that others have reached heights as great, and descended into depths of enterprise as deep, as have been reached by the would-be leading class journal of her Majesty's dominions.

Restrictions on London Builders.

The building trade of London has been legislated upon at various times to such an extent, that if all the acts still in existence, which were intended to regulate it, should be literally put in force, there is, perhaps, scarcely a house in the course of erection within metropolitan limits which might not be interfered with and prohibited from completion, upon the ground that the conditions of some by-law or Act of Parliament, obsolete but never rescinded, had not been complied with.

Then came the Metropolitan Board of Works, with supreme power over the thoroughfares of London, to vex still further the souls of the building fraternity, and elbow them out of the way wherever they show themselves, and still seeking increased powers from Parliament to put them to further expense and annoyance at every turn. If the Metropolitan Board of Works succeed in getting their new bill through the House, no builder can erect a shed for his workmen, nor make a road for his materials to any new building, without first obtaining the authority of the Board of Works in writing, under severe penalties constantly recurring.

The Royal Institute of British Architects, at their fortnightly meeting, which took place last week, held a long discussion upon a proposal to apply to Parliament for the adoption of a General Building Act, for the purpose of regulating the supply of buildings of various kinds, with the sanitary provisions essential to all. Mr. Boult, who introduced the subject by reading an elaborate paper, asserted that, including by-laws, the number of varying codes for the government of the trade had been estimated at pretty nearly 2,000. What was wanted was simplification and intelligibility. In a General Building Act, local peculiarities might be allowed for, anomalies would disappear, and practical uniformity be substituted for it. Mr. Rawlinson, C. B., was of opinion that any General Building Act should have a wide range, and must not be centralized too much; and, as to sites of houses, he did not see how any general law was to apply to them, for some houses were built on sites that it was impossible to sewer and drain properly, and he knew some towns—he ought to have named them—the state of which was "absolutely shocking." This gentleman was severe on "jerry builders," which he wanted a law to reach. But are there not plenty of safeguards already prescribed by law, if only they were properly applied? What are our *district surveyors* for but to see that proper materials and good workmanship are used in the buildings they have to survey? Speaking as a Government official, he did not want too much centralization. He thought it would be bad for this country if, like France, they could not move a paving stone without the authority of a Government officer. Dr. Thorne, of the Local Government Board, spoke to the point, when he said the curse of large towns was the overcrowding upon area, and he might have included the suburbs of London in the same rebuke. In rural districts, where five years ago cows and sheep were grazing, houses are now so crowded together that some of them have no more outlet than if they were built in Barbican. It would not be difficult, one would imagine, to get a law passed which should prevent the country about London from being overcrowded in this way. Sanitary regulations are probably as much appreciated by the public now as they ever were or will be, but some penalty might be inflicted perhaps on builders who willfully disregard them. Before this can be done, however, they ought to be well defined. Some of those sanitary regulations, which consist in clever contrivances for letting in currents of cold air to ventilate our law courts and places of public assemblage, not unfrequently mar your enjoyment of them by sending you home with a cold and sore throat. A Mr. Hebb considered it would be impossible to frame a law that would work well for all England, and alluded to the apathy of Government on the question, as in 1875, when an attempt to codify the existing law met with a disastrous failure. Other speakers followed, but it does not appear that any resolution was passed.—*Timber Trades Journal.*

Subscriptions—How to Stop and Renew Them.

We will send this journal FREE the balance of this year to all new subscribers for 1883.

If you should desire to discontinue, notify us by postal card. We do not under any circumstances send this journal to any one when we know the subscriber does not wish to continue. If the journal should be received by subscribers beyond the time when their subscription has expired, be sure to notify this office.

Our terms for 1883 will be $2 in advance. Send money by postal order or registered letter. Address—California Architect, 240 Montgomery St., San Francisco.

Spirits of turpentine is now made from sawdust and refuse of the saw-mill. It is extracted by a sweating process, and yields fourteen gallons of spirits, three to four gallons of resin, and a quantity of tar per cord. The spirits produced have a different odor from that produced by distillation.

Now is the time to subscribe for 1883. Send us $2, and we will send the numbers for the balance of the year 1882 free.

The Mechanics Fair for 1882 is Ended.

The recent exhibition in San Francisco was a success, financially, to the institution under whose auspices it was conducted, and in excellence of arrangement and management, as well as creditable and practically beneficial to exhibitors. The Institute having at last secured a permanent lodgment for its pavilion, in the possession of a block 275x412½ feet, bounded by four streets, annual, or bi-annual exhibitions are now an assured certainty. The waste of money heretofore involved, *first*, in expending many thousands of dollars in the erection of an exposition building on the lot now occupied by the Lick House, to be demolished with loss at the end of a short occupancy; *second*, a like more costly construction on Union Square, to fare the same fate; *third*, and this followed by a still greater expenditure of money, in the erection of the building on Mission, Eighth and Market streets with like result, has consumed $100,000 or more, which might have been used to good advantage in the erection of a permanent edifice. The amount of money sunk in the several erections and the tearing down of temporary places of exhibition would go a long way toward paying for the present lot, or in the erection of a substantial and commodious brick building. But as this wastage is now ended, except the further loss which will be sustained when the present frame shell shall give place to a brick or other construction less destructible than wood, the accumulations from annual exhibitions will enable the reasonably early completion of a building which will be an ornament to the city of San Francisco.

In our September number we noticeed a few of the exhibits, and add in this number a few more, not having the space for full mention of all.

Weed & Kingswell's display of brass work and devices equaled any other in the same line, in character and merit. This firm is one of the oldest in San Francisco, and turns out as fine brass work as any establishment on the Pacific Coast. They received a gold and silver medal for brass and plumbers' goods respectively.

P. H. Jackson received silver medal for a device for more complete combustion of coal. The same gentleman has made cast-iron girders a specialty, and we hope his device in this direction may yield him a fortune. They are good beyond all question, and may be made to carry any reasonable span, or any amount of weight with safety. A practical specimen of the "Franklin Girder" may be seen in the brick building now in course of erection on Market Street, opposite the Phelan building.

Llewellyn Steam Condenser and Heater, a San Francisco invention, received a diploma. From practical knowledge and observation we are enabled to state as a fact that it is a "good thing."

J. B. Jardine, a practical, working machinist of San Francisco, made display in power shears, punching machines, boiler tubes, etc., which secures him a bronze medal. Of our own knowledge, we can say that Mr. Jardine is a skillful and practical workman.

W. W. Montague & Co., silver medal for marbleized mantles, grates, etc.

Whittier, Fuller & Co., gold medal for California manufactured oils and paints, beside three silver medals for mixed paints, ground in oil and in colors, Pacific rubber paint, and California made glue.

John Mallon & Son, gold medal for stained and ground glass for architectural work, and silver medal for cut and embossed work.

The Titus Sewer Trap, a San Francisco invention, received silver medal.

B. E. Hendrickson, silver medal for safety clutch for elevators. We know of nothing better for the purpose.

Latson & Co., diploma for bronze building hardware.

S. H. Herring, diploma for best rustic furniture.

T. J. Bass, silver medal for artists' materials.

Tradesmen, artists, and dealers and producers generally, who become provoked and jealous because competitors in their respective lines have secured medals or premiums at the hands of committees of examination and awards, in connection with local or State fairs, should bear in mind that the present age is one in which people must make displays in some shape to secure notice and increased patronage; and those who win the emblems of superiority through fair expositions deserve every advantage attained thereby. Perhaps many who prefer to limit the exhibition of their goods, wares, merchandise, and inventions within the compass of the walls of their stores and shops, and show windows, might obtain gold or silver medals or diplomas, provided they would avail themselves of offered opportunities calculated to attract attention and increase patronage.

A Valuable Combustion Device.

We have before us a pamphlet published by P. H. Jackson in reference to a "*Device for the more Complete Combustion of Coal by means of the Eliminating Gases of Hydro-Carbon being continually drawn from the top of the burning fuel.*" It would afford us pleasure to reprint the entire contents of the pamphlet in our columns, so that our readers might have the full benefit of Mr. Jackson's explanation in detail. But as we are "full for this issue," we can only call attention to the matter, leaving it for those who desire to be more fully informed to call on Mr. Jackson, or send for a copy of the pamphlet, in which the theory of the device upon its own merits, and in comparison with others, is intelligently argued and maintained, showing its practical superiority and economic value. We reproduce the special claims set up by the inventor, in his own words:

1. It is simple in construction, and accomplishes a great end in saving now a wasted wealth.

2. It will burn under most any circumstances, when once under way.

3. The oxygen of the atmosphere, being the life and vital force of the combustion of fuel, is heated, and has ready access at the bottom and top, on the outside and in the center of the burning mass and in sufficient quantities requiring twelve times the quantity in weight to one of weight of coal, burning nearly all the combustible gases, consequently losing but little in waste.

4. The intimately mixing of the gases of hydro-carbon, called coal gas, such as we burn from gas jets, with that of the oxygen of the atmosphere, when ignited in the mixed state, burns with great heat, similar to that of the Bunsen burner, or the blow pipe.

5. The continuous drawing away of the combustible gases hydro-carbon from the top of the coal in the consuming chamber to beneath the fire, is automatic in its action, and is with sufficient force to prevent its escape through the passage for the exit of the carbonic acid gas. In case fresh coal is put on top of incandescent coal, excessive cooling immediately takes place, also excessive formation of combustible gases. In other appliances this gas wholly, or in smoke burners partially, goes to waste, but with my device it is drawn down beneath the fire again and again, to be consumed as fast as formed.

6. The peculiar constructed chambers below the fire for the passage of the atmosphere on both inside and outside of the chamber containing the gases of hydro-carbon, by which the latter is acted upon with double the force to that in common steam injectors, and such like appliances for producing vacuums.

7. I claim the chemical compound as applied that attracts and passes off the destructive element carbonic acid gas which is generated by complete combustion of carbon. In a furnace similar to this, sixty-five pounds of bituminous coal burnt twenty-five and a half hours.

The device and subject presented should enlist the attention of all parties using coal as a fuel, as it proposes a saving in cost, in addition to its many other practical advantages. It is applicable to steamboats, steamships, locomotives, stationary engines, smelting furnaces, heaters, furnaces, stoves of all kinds, and last though not least, the power horses of the street cable roads of San Francisco.

Advance in Price of Labor.

Employees in all lines of mechanical operations are at present receiving advanced pay over the rates ruling during the last former five years. The general revival of business in California has restored a healthful tone in the labor market, and the demand being equal and in some lines greater than the supply, the tendencies have been in favor of the working classes, as the absorbtion of surplus in supply in all cases is the next thing in effect to positive insufficiency. As long as labor goes begging, and employers can pick and choose from the mass of seekers after work, prices remain at the option of the masters, and the less proficient classes suffer from the impossibility to secure engagements. But when doors are open in all directions to competent help, the *dependent* under less favorable circumstances become the *independent* classes, and employers of necessity yield to the natural tendencies, submitting to more conciliatory rules and regulations, and accepting concessions which would be declined under a reversed state of affairs.

The fact that labor in *commanding* and *demanding* better remuneration argues well for the common interests of the State at large, as well as to the mechanical classes specially; as this can exist and be sustained only when general prosperity prevails. During periods of depression in business, reduction of pay to operatives is insisted upon as a necessity, and it is simply a reversal of advantages when it becomes possible for the workers to assert their rights and claims for better pay. Low wages and scarcity of employment is the result of restricted activities, and may be termed the cold and cloudy season in business affairs, which holds back and prevents the germination of the seeds of prosperity; while sustained conditions which warrant the laboring classes in demanding better pay, and induces employers to yield increased remuneration to their workmen, may be denominated the season of sunshine and showers, which causes the seed of business to fructify and bring forth golden harvests.

The impoverishment of those who are forced to depend upon their daily earnings for the common necessities and comforts of life reacts upon the general prosperity of the country; and while the few with secured sufficiencies of this world's good may be able to live above the severities, storms, discomforts, and privations imposed upon the less favored, the great mass of the community become mere livers from day to day, as best they can, and the blight of despondency and the murky atmosphere of unhealthful business life robs thousands of hearts and homes of those joys and pleasures made possible by the great order of things established by the invisible power of light and love, that watches the sparrow's fall and clothes the valleys and hills alike with verdure and beautiful flowers, and makes the trees to bear fruit, and fields to yield mountains of seed for the sustenance and comfort of mankind.

Now is the time to subscribe for 1883. Send us $2, and we will send the numbers for the balance of the year 1882 free.

San Francisco Plumbers.

The *American Plumber* for September, after copying an article from this journal in relation to sewer and plumbing matters in San Francisco, in which we stated among other things: "Beside this, there is no other place on earth where meaner and less skillful plumbing work is done, by a class of beings calling themselves 'practical plumbers'—a title stolen from the truly practical and competent, many of whom we have in San Francisco, under which they disguise themselves, while neither knowing nor caring anything about the finer and essential points involved in skillful sanitary plumbing." Our contemporary adds: "This is rather rough on the 'Frisco plumbers, and we fear that the ARCHITECT must be mistaken." We assure our Eastern contemporary that we are not mistaken in the statements made, nor in any part thereof. That the facts are just as stated by us. We have in San Francisco as good, competent, faithful, and honest plumbers as can be found in any city in the Union, but we have also very many as incompetent as men can well be. And our "rather rough on the 'Frisco plumbers" is not a word in exaggeration of existing facts. The fact that there is no plumbing law upon the statute books of this State, nor any city ordinance providing restrictions in the execution of plumbing work, leaves the field open and clear to any fellow who chooses to hang out his "practical plumber" sign, and scores of them have availed themselves of the easy opportunity to set themselves up as master plumbers, being unable to secure employment as competent journeymen, and aware of the fact that hundreds of owners are such absolute dolts as to always accept, at least for the first time, the man who offers to do plumbing work at the least cost, rejecting the competent men as too high in their charges. The matter of good work at proper prices, and abortive attempts at workmanship, resting altogether upon the item of cost.

As illustrative of our position in this matter, we will relate but a single case, given to us as fact, by one of the leading plumbing firms of this city. A lad of sixteen summers engaged with the firm referred to, as an apprentice, at $4 per week. As such he worked for six months; at the end of that time he demanded an increase of wages. This being refused, the youth stated that he would quit and begin business on his own account. This it is stated he did; and we submit whether, with such specimen of "practical plumbers," we were not fully justified in saying all that we did. It needs no argument to convince intelligent plumbers that so far as this and other *similar types* of mechanically educated frauds are concerned, that they have not the slightest correct knowledge of plumbing and sanitary sciences. If it becomes necessary, we have it in our power to prove conclusively the hardest thing we have thus far charged in the columns of this journal, in connection with plumbing and sanitary matters, in which tinsmiths, stove dealers, and others destitute of a single well-learned thing or principle will figure conspicuously.

SAN FRANCISCO, Oct. 9th, 1882.

TO THE EDITOR OF THE CALIFORNIA ARCHITECT AND BUILDING NEWS:

Dear Sir—Having a knowledge of your interest in all questions that concern the health and comforts of our home life, and especially in regard to that which pertains to the work of the plumber; and any change in the manner of connecting waste water pipes which will lessen the chance of foul odors being given off from the contents of the pipes into the rooms where washbasins or bath-tubs are located, and the especial pipe I wish to refer to is the overflow pipe, will at least receive your attention. As is now the custom, the pipe which is attached to the outlet near the top of the vessel (either bath or basin) is a continuation of the waste pipe, and whenever the vessel is used and the plug withdrawn to allow the dirty water to pass off, a portion of such water is thrown up into this overflow pipe, the greasy parts of which adhere to the sides of the pipe, there to remain and decompose until the vessel is used again, when it receives more of the same filth, which in time emits an odor which is often mistaken for sewer gas. The remedy I propose would be to have the overflow pipes entirely separate from the waste pipes, and have it run to the outer air, and by that means, instead of its being a nuisance, its being flushed by a current of pure air would be a benefit to the room where it was placed. Some may say this would entail the extra expense of another pipe, but such is not the case, as in all plumbing work of to-day provision is made for safety pans and waste pipes leading from them either through the side of the building or down to the ground. And by increasing the size of this safety pipe to one and one-quarter inches, it would suffice for both purposes. But I would suggest, instead of the pipes ending at the ground level, they be made to discharge outside the buildings, at least two feet above the ground, either at the side or rear of the building, as circumstances may require. D.

We are pleased to receive the foregoing suggestions from one of the well-known really practical plumbers of San Francisco, and hope that others will follow with criticisms or recommendations. There is a large latent pen and thought talent among the plumbers of this city, and in their own defense we should receive many similar communications. As the result of the many bad things that have been done in the plumbing line by incompetent, and sometimes by otherwise good workmen, under the pretext that being compelled to "figure low," so as to secure work which would otherwise be intrusted to spoilers of good material, upon its "cheap" principle, a sentiment not by any means complimentary to the plumbing trade prevails; and we are surprised at the apathy manifested by the better class of plumbers, in not striving to relieve themselves from the common prejudice existing. It is a poor defense for good men who, by the acts of others, are brought under even unmerited censure, to draw around them the mantle of confidence in their own abilities, while the general opinion prevails that all plumbers are cast in the same mold, and are alike defective.

We fully understand the injustice of sweeping denunciations, and do not approve them; but however unjust they may be, those against whom they are cast must bear them, unless they adopt successful methods of relief. The columns of this journal are free to the use of all Intelligently written articles in defense of better workmanship, and the improvement of mechanical operations.

A new invention in the production of cement sewer pipes consists in placing the pipes after molding in an air-tight chamber and subjecting them to the action of carbonic acid gas and water for six or eight days. The gas is produced by burning charcoal in a common coal stove. As it passes into the air-tight chamber where it is absorbed by the pipe, it is cooled by passing through a hollow box immersed in a tank of cold water, so that no gas is permitted to enter the chamber at a temperature not above 60° Fahrenheit. By this means, the patentee claims to get the same effect on cement in a few days that it would get if placed in a cool, damp cellar for fifteen or twenty years.—*Boston Commercial Bulletin.*

☞ Subscription price of this journal is $2.00 in advance.

Francke's Monuments.

SPECIAL NOTICE TO ARCHITECTS AND MARBLE WORKERS.

We have just received an invoice of the above celebrated work. In size it is 12x18 inches, and contains numerous illustrations of monuments and tombstones, from the simple slab to the stately mausoleum; also designs for mortuary chapels, sarcophagi, vaults, obelisks, etc. The price of this work has been reduced to the sum of $9, upon receipt of which we will forward a copy to any address.

A Legitimate Use for Skim Milk.

Phillip Heinze of No. 603 First Avenue, was accused in the Jefferson Market Police Court yesterday with having in his possession nineteen quarts of skim milk. He stated that he supplied the steamship line for Havre with condensed milk, and as an accommodaion, he procured the skim milk for its officers. They had it mixed with red lead for painting the vessel's smokestacks. In support of his statements, he produced an order from the captain of the steamship Canada for the milk in question. Justice Ford discharged him.—*N. Y. Tribune.*

Market Reports.

LUMBER.—With the present demand, there is no danger of either a fall in prices, or of our merchants being able to keep a large stock on hand.

PAINTS.—The price of paint has been reduced owing to the competition of Eastern firms. The best white lead can now be had for 6½ cents per pound.

Building Intelligence.

Building operations still continue brisk, as will be seen by our report. The late rains has put a damper on the erection of buildings in the country; but in our judgment it is only a temporary lull. Mission property is looking up, and next year there will be a larger increase of buildings erected in that part of the city than has been witnessed for many years.

Either of these journals, in connection with the CALIFORNIA ARCHITECT AND BUILDING NEWS, will be sent to one address for $2.50 per year.

General Items.

As has been stated in the several issues of this journal during the current year, a large degree of activity has prevailed in building circles since January, 1882, sometimes approximating a boom in proportions and extent. And although there have been few—very few—single improvements of large dimensions and cost—fewer of the expensive kind than were commenced in 1881—the character of buildings erected in 1882 speak well for the prosperity and growth of San Francisco in a three-fold sense; first, the mere fact that a comparatively large number of houses have been built presumes the employment of mechanics and laborers generally, and consequent bettered circumstances and comforts to the working classes of the community, which in itself is a pleasing feature to contemplate; secondly, the improvements being confined mainly to private residences of various cost, some of them being moderately elegant in design, appointments, and comforts, and a good class of tenements in single residences and flats, none of which seem to remain long unoccupied, evidences the increase of population, and the expansion and general growth of the city; and thirdly, all this is being done mainly from the cash resources of owners, with far less resort to mortgages for the purpose of raising the necessary building fund, demonstrates the fact that the financial conditions of the masses are much improved over former years, when perhaps three out of every five cases of building improvements were incumbered by mortgages. This view of matters is supported by the following, from Magee's *Real Estate Circular*:

"The savings banks did a very light business last month. One of the smaller banks—the Humboldt—led off in its loans. It lent $119,800 on city property. The Hibernia Bank only lent $81,325, the German Bank, 67,750, and the Savings Union, $65,150. The Hibernia Bank released $438,400, but $300,000 of that sum are to be credited to the release of an old mortgage last month, lately renewed at a lower rate of interest. The German Bank released $213,375, and the Savings Union $78,070. All of the banks continue to report a very light demand for money. The low rate of interest of 6 per cent., the banks paying the mortgage tax, tempts few or no persons to speculate. Those who now borrow are doing so to improve property they already own, or to acquire homesteads for actual occupation. There is no speculation or excitement, in short, in any kind of city real-estate, consequently borrowers now are not speculative in any sense of the word. The number of real estate mortgages recorded last month was 145, of the value of $964,760. There were 161 releases, aggregating $1,311,783. The real estate loans made by private capitalists were very heavy last month; they lent $555,735. Mr. Blythe borrowed from John Parrott last month $375,000, at 6 per cent., on his Market Street property, releasing at the same time an old loan of $275,000."

There is a great deal of talk as to what is to be done in the near future, and although the statements made may be in excess of the undeveloped facts of the future, still there are movements and transactions on foot which give color to large anticipations; and from all that we know or have been able to learn, we are warranted in predicting continued building prosperity in San Francisco for 1883.

All present appearances indicate an undiminished if not increased demand for both skilled and unskilled labor, with perhaps partial and temporary exceptions during the winter months. And whatever break may occur, will be most felt by the less proficient classes, whose services, as a matter of course, are the first dispensed with. When a lessening of forces becomes necessary, the better men are selected and retained, and the inferior discharged. This fact should inspire every man who is compelled to rely upon his daily earnings for the means of support for himself and family to qualify himself to hold his situation so long as there is work in his line for any one to perform. The abject poverty of some mechanics and laborers is the result of their individual neglects and gross indifference to the important duty of filling well and faithfully a position among the best of their fellow-workmen. Indolence and carelessness have kept multitudes in poverty, who might have bettered their condition by energetic efforts to overcome the disadvantages surrounding them. And those who willfully disregard the common law of life, in matters involving their best interests, richly desire all the evils which they bring upon themselves through their persistent omission or willful neglect to secure to themselves benefits which are within the reach of all who act manfully and wisely in the contests of life.

Some people affect to believe that they derive no benefit from advertising, for the reason that they cannot trace any particular transaction to any particular advertisement. Neither can we attribute the growth of vegetation to any particular drop of rain or ray of sunshine, but it is very evident that without rain or sunshine it would fail to flourish.

Redwood Lumber.

TRUE AND FALSE ESTIMATES CONSIDERED.

The *Post-Intelligencer*, of Seattle, W. T., has some severe strictures on Prof. Sargent's article, recently published in the *North American Review*. An extract from the article reads as follows:

"The belt of redwood forest along the California coast has always suffered severely at the hands of the lumbermen, and many of its finest and most accessible trees have already been removed. A large amount of this valuable timber is still standing—less, however, than has generally been supposed; and at the present rate of consumption, the commercial importance of this forest will have disappeared in a few years more."

This the Washington Territory paper calls "the very error of the moon, so to speak." It says:

"In Humboldt County, Cal., the whole area of the redwood forest has been mapped and platted. There are something like 500,000 acres of that timber in that county alone. Disinterested experts estimate 100,000 feet of lumber per acre as an average, if not a small yield. At eighteen dollars per thousand feet, the redwood of Humboldt County alone would just about pay the present national debt. There are immense untouched bodies of redwood in Del Norte County—to the north of Humboldt—in Mendocino, Sonoma, Marin, and Santa Cruz counties to the south. We do not know what the writer means by a few years. The oldest child begotten by any one of the babes born to-day will not live to see the supply of redwood exhausted on this coast. A statement so wild as the above leaves little room for the reception of what else the writer has to say as trustworthy material upon which to base an opinion as to the extent and value of our forest growths. We will not follow him further in this direction. He evidently is not at home in the woods."

An interesting feature of these comments is the estimate of the amount of redwood standing in Humboldt County. It is placed at 50,000,000,000 feet, while the forestry bulletin of California, prepared under the directions of Prof. Sargent, put it at 25,825,000,000 for the entire State. According to the opinions of practical lumbermen who have traveled through the redwood region, a poor guess would be of more value than the figures issued by government.—*Northwestern Lumberman.*

Even admitting that the area of redwood is what is claimed, we would like to inquire how many thousands upon thousands of acres are situated so far from tide water, and of so much difficulty of access, as to almost preclude the possibility of the trees ever being cut for lumber. There are magnificent bodies of timber lying in between the different ridges, that the only way we see could ever be got out, would be by cutting the logs in the bottom of the cañon or ravine, and have a wire cable road running over the hill with cars made especially for carrying lumber. The same power could be utilized for the cable that is used for sawing the logs. There are places, however, that are two steep and difficult of access for even a cable road; and only those who have lived in the redwoods know what difficulties there are to encounter in the construction of a wagon road through the redwoods. Again, no allowance has been made for the great increasing demand for our own State, and the VERY RAPIDLY GROWING DEMAND FOR EX-

PORT TRADE. This last item is destined to be in a few years no small factor in the decimation of our noble forests. Again, no allowance has been made for the millions of feet that are being wasted by fires, and the absolutely wanton destruction of clearing lands for the sake of convenience. We know of one party who actually hired a lot of cheap men to cut down timber from the top of a ridge, simply that the sun might shine a little longer on his clearing. We are inclined to the opinion that while the figures given by the W. T. papers represent the amount of lumber actually to be seen, the amount given by Prof. Sargent is about that which is actually available for future use. One of the problems of the future to be considered is an easy and economical method of getting lumber out of apparently inaccessible places. We shall be pleased to hear from our friends in the redwoods upon this subject.—ED. CAL. ARCHITECT.

Another Attempt to Obtain Plans without Pay.

The accompanying letter explains itself, and serves to illustrate how meanly unfair some well-to-do men can be, and how the architectual profession is undervalued by some people, because of the bantering, huckstering methods pursued by that class of non-competents, calling themselves architects, who enjoy no proper estimate or understanding of the duties and responsibilities of a qualified architect, and who entertain no right conception of the dignity of the profession. It is this class of men in America who have belittled the profession, and in certain spheres created the presumption on the part of so many property owners, that the skill, services, and labors of architects are of but little value, and can be obtained for any consideration that may be offered, even the shadowy honors of being recognized as an architect without merit. Hence some even wealthy men play with the opportunities thus afforded, and put forth invitations for competitions which lack all semblance to fair-mindedness. The letter reads:

SEATTLE, W. T., Sept. 30, 1882.

EDITOR CALIFORNIA ARCHITECT.

Sir: Having read in the current number of your paper an artitle headed "Another Absurd Competition Proposition," I am induced to forward you in that connection the inclosed scrap, clipped from a Seattle paper, containing a proposition in my opinion even more preposterous than the Brooklyn absurdity, for as you will perceive by the published notice that the gentleman intimates, with a directness and decision as distinct as it is delicate, that it is entirely dependent on his gracious will and pleasure whether or not he ever pays *anything* to anybody. I am pleased, however, to be able to say that the invitation did not seem quite satisfactory to the profession here generally, for though there are eight advertised architects in Seattle, and perhaps as many more who don't advertise, only two responded to the call.

The building is intended to be a handsome three-story brick and iron corner block, extending some fifty or sixty feet on both streets.

Respectfully,

* * *

NOTICE TO ARCHITECTS.

I will receive plans for the building to be erected on corner of Mill and Front Streets until August 3rd next.

The plan approved and accepted will be paid for, and no other, and all may be rejected at my option.

Particulars at my office. JOHN LEARY.

SEATTLE, July 25th, 1882.

All such absurd and unbusiness-like propositions can only be classed as practical insults, manifesting a disposition on the part of the proposer to obtain a something valuable in itself and to the party proposing, with no corresponding disposition manifest to return fair recompense for the value obtained. And the common reply of a willingness to pay for such plans as may be approved, is but a subterfuge to cover a wrong act. For in a majority of cases, the real purpose is to- *find out* certain involvements, and to gain desired information without cost.

No just and fair-minded man would be guilty of asking of others the expenditure of time, skill and labor, without a cheerful willingness to propose recompense, or a sense of duty to pay for the services performed at his instigation. It is the brutal-minded who seek to secure and serve their own purposes at the expense of others, without consideration of the rights of others; men who, having gained an advantage in this world's goods, use its power in oppressing and humiliating others less fortunate, with no sentiment of that royal virtue, Be just unto others as well as to thyself.

But so long as the architectural profession is incumbered with parties who consent to crawl, and yield to any and all demands made upon them to ape the architect, while better fitted for the hoe and shovel, or perchance the jack-plane or trowel, it may be expected that there will be others to whistle and laugh at the wagging tails of the canines, who dare not attempt either to bark or bite, even though a kick should accompany the whistling.

One thing is very certain, that no such proposition would be noticed by any architect possessed of fair qualifications, or appreciating the virtues which should characterize those who venture in paths once trod by such men a Michael Angelo, Wren, and thousands more even of these latter years, who placed and places value upon their conceptions, delineations, and services.

If such advertisments as Mr. Leary's read—Wanted. A few incompetent paper spoilers, and boys desiring a little practice in line making and shading, to practice on attempts at plan-making for a building, etc., there would be no offense, for the service of such parties would be equally as valuable as the proposition of Mr. Leary, of Seattle, or the Brooklyn people are honorable and fair.

All such cases as that under notice are arguments why Chapters of architects and architectural societies should be established in all parts of the country, and such rules, regulations, and procedures established as will at least inform owners that qualified architects are not creatures whose services may be obtained without fair and just compensation. An architect's time, skill, and labor are to him as much of value as the knowledge of law or medicine is to those who plead before courts of justice in defense of their clients, or stand by the bed-side of the sick or dying, administering to their relief, when disease or death spreads the shadows of sorrow around fond and loving hearts.

If Mr. Leary wanted a steam boiler and engine or other thing made of special pattern, it would be just as reasonable for him to make known his wants by advertisment or personal application, requesting boiler-makers, for instance, each to make a boiler, and when made, the one accepted by him would be paid for, or, at "his option," all of them might be rejected. Is it likely that any worker in metals or other materials would be such an unmitigated simpleton as to notice the proposition? And would not the reply be, The man is a fool? The analogy is harmonious, for if the iron used in the one case cost more than the paper, office rent, etc., in the other, the time and study required of an architect to qualify for correct plan-making, is a matter of long years of diligent application, and possesses a value, and competent architects so understand the matter, and it were well that all property owners reached the same conclusion.

☞ Science of Carpentry Made Easy, $5.00.

Logging Interests.

A great storm has prevailed in northwestern California, which has seriously affected logging interests, and reduced the intended output considerably. The Eureka *Times* states that the damage sustained will mount up into the hundreds of thousands of dollars. In all the camps large crews were at work, and efforts were being made to get down to market before the rains set in, so that a sufficient amount of logs to supply the mills all winter would be at hand. The storm lasted two weeks, and during that time camps were shut down, and it is estimated that the log supply will be 10,000,000 feet short of the amount that would have been put into stream had the weather been more favorable. The mill men and contractors have suffered great loss by reason of heavy expenses during the storm.

"Building."

A new architectural and mechanical paper has made its appearance in the literary world. It is published by W. T. Comstock, the successor of the old architectural publishing firm of Bicknell & Comstock. This fact is sufficient to prove to its readers that nothing will be left undone to place it on an equal footing with the other really good journals published in the same place. In the initial number, the article on perspective will be found of much interest to students and mechanics. Attention is called to the large "ad." in the September and October issues of the "CALIFORNIA ARCHITECT," in which the future designs of the editor are fully set forth. "*Building*" is published in New York City, and will be sent to any address upon receipt of $1.00. To those who wish to subscribe for a shorter time, so that they may judge of the merits of the journal, the sum of twenty-five cents in postage stamps will secure a copy for three months. Address W. T. Comstock, 6 Astor Place, New York City. P. O. Station D., or the office of this Journal.

The Sanitary Engineer.

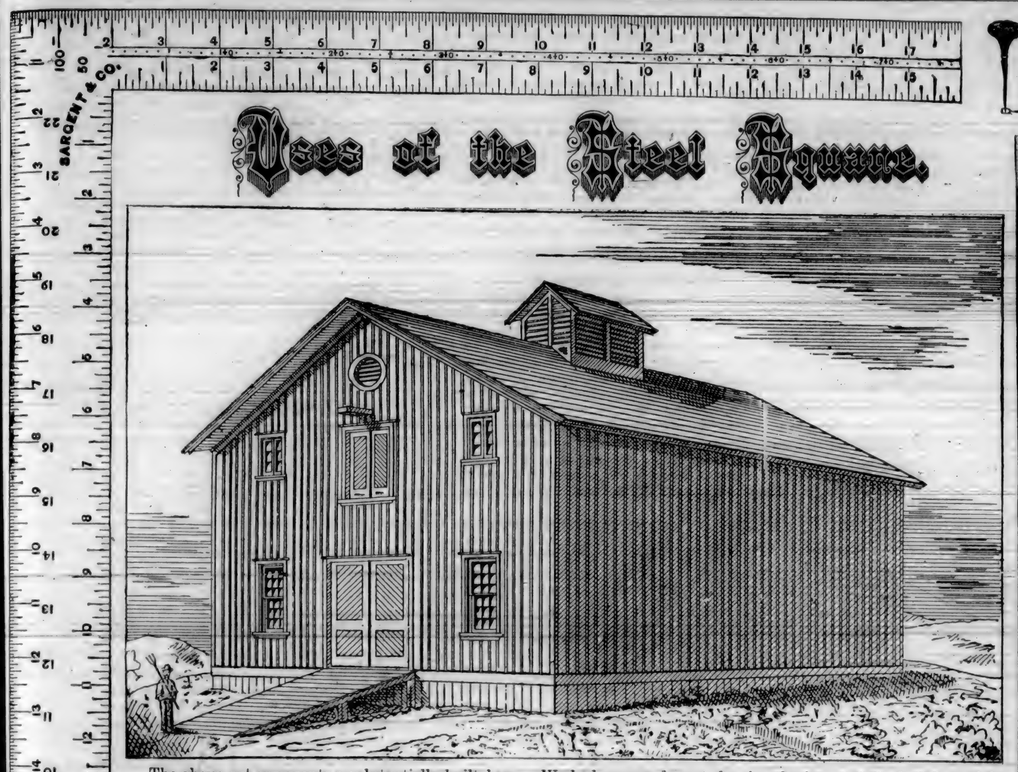
The true spirit of enterprise has characterized the management of our New York contemporary from its commencement, and as a new feature its managers now propose to supply a deficiency created by the refusal of Congress to grant an appropriation to defray the expense of continuing the publication of the Bulletin of the National Board of Health—a valuable source of information, which, extinguished, creates a vacuum in sanitary intelligence greatly to be regretted. To repair this damage, and restore to some extent at least the almost universal advantages of the National Board's Bulletin, our contemporary has so arranged with the Board that hereafter the more valuable portions of what would appear in the Bulletins, were they continued, will be found in the columns of the *Engineer*.

Index to Volumes I. to IV.

We are having carefully prepared a full index to all articles in volumes I. to IV. It will be of the same size as our regular journal, so that those who preserve their monthly issues for binding at the close of the year, by securing an index first, can have it bound with their monthly numbers. We will send one to every subscriber. Any one failing to receive it should notify us at once.

☞ $2.50.

We will send the "California Architect and Building News" for 1883, and one copy of "Palliser's Model Homes," for $2.50.



Uses of the Steel Square.

The above cut represents a substantially built barn. We had prepared a cut showing the frame of the building, giving the sizes of the various sills, joists, girders, etc., but by an accident just before going to press, the plate was mashed so it was impossible to use it. It will appear in our next, with a full explanation of the same.

We would advise all those who desire a full series of these articles on the Steel Square to immediately send for any or all of the back numbers, as there are but very few remaining of several different months.

☞ $10.00.

We will send the "California Architect and Building News" for 1883, and one copy of "Francke's Celebrated Work on Monuments," for $10.00. Every architect and marble-worker should have a copy of this work.

☞ $5.50.

We will send the "Science of Carpentry Made Easy" and the "California Architect and Building News" for one year, for the sum of $5.50.

☞ $3.50.

We will send the "California Architect and Building News" for 1883, and one copy of "Palliser's Useful Details," for $3.50.

☞ $4.25.

We will send the "California Architect and Building News" for 1883, and one copy of "American Cottage Homes," for $4.25.

☞ $6.00.

We will send the "California Architect and Building News" for 1883, and one copy of "Science of Carpentry made Easy," for $6.00.

Any one sending us 5 new subscribers to the "California Architect and Building News," we will give one copy each of "American Cottage Homes" and "Model Homes."

☞ $3.50.

We will send the "California Architect and Building News" for 1883, and one copy of "Palliser's Useful Details," for $3.50.

☞ $4.25.

We will send the "California Architect and Building News" for 1883, and one copy of American Cottage Homes," for $4.25.

☞ $10.00.

We will send the "California Architect and Building News" for 1883, and one copy of "Francke's Celebrated Work on Monuments," for $10.00. Every architect and marble-worker should have a copy of this work.

☞ $6.00.

We will send the "California Architect and Building News" for 1883, and one copy of "Science of Carpentry made Easy," for $6.00.

☞ $5.50.

We will send the "Science of Carpentry Made Easy" and the "California Architect and Building News" for one year, for the sum of $5.50.

Practical Lessons in Architectural Drawing is a work that should be in the hands of all those who desire to be proficient in the use of drawing instruments. Sent post-paid to any address for $2.50.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

The Triangle.

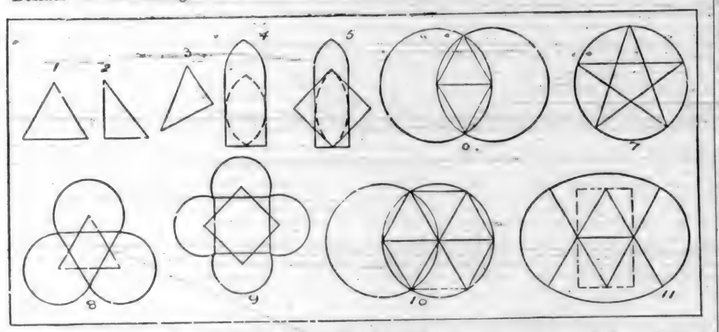
SPEECH DELIVERED BY J. GASH, ESQ., BEFORE THE SAN FRANCISCO CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, NOV. 3, 1882.

Mr. President and Gentlemen:

I have taken for papers to read before you this evening a subject which I am fully aware you are all as familiar with as I am, being, as it were, the alphabet of our profession. And though I may not read to you anything that is new, yet what I have to say will, I am sure, recall to your minds many pleasant thoughts of the days when you were studying the alphabet of our profession—geometry. From that alphabet I have selected the triangle for my subject. That this may indeed be justly called the Alpha of architectural design, we have only to study the architecture of Egypt, Greece, and Rome; and for its zenith we may take Gothic architecture in France, Germany, and England; and there we see it applied in almost every portion of those sacred edifices that were erected throughout Christendom.

That Christianity should lay a strong claim to its use in her sacred edifices, is not much to be wondered at, as the foundations of its belief was based on the trinity of which the *triangle* is so justly symbolical.

Besides its use amongst the ancients as a



symbol of the Diety, having neither beginning nor end, and being perfect in all its parts, it is not strange that it should be readily applied by Christians in buildings erected by them for worship.

The crystals of gold, the noblest of metals, is an equilateral triangle. The diamond, the the most valuable of gems, crystallizes in the form of the octahedron, each face forming an equilateral triangle.

That its use was well known to the Egyptians, we have only to study the architecture of her pyramids, and there we see its use was almost as well known as it is by ourselves at the present day. In their measurements we find, according to M. Jornard, a French writer on Egyptian antiquities, that the triangle whose sides measure 3, 4, and 5 was a symbol frequently employed by Egyptian priests, and was sometimes called the Egyptian triangle. It was with them the symbol of universal nature. The base representing Osiris, or the male principal; the perpendicular, Isis or the female principle; and the hypotenuse Horus, their son, or the product of two principles.

On these numbers, 3, 4, and 5, is based the solution of the 47th proposition in Euclid, that the square of the hypotenuse of a right-angled triangle is equal to the sum of the other two sides, supposed to be discovered by Pythagorus; but Plutarch and other ancient writers say that this solution was well known to the Egyptian priests and communicated to him.

Its use amongst pagan nations we find by reading heathen mythology. The double triangle of five points being worn as a talisman and an emblem of health, and was also used as an emblem of fellowship. This form of double triangle is sometimes called the five-pointed star, and perhaps for the above reasons have been adopted as an emblem in our national flag. The double equilateral triangle being an emblem of perfection, with the all-seeing eye, has been adopted by Free Masonry, and worn by its members to the present day.

That the triangle was used in Grecian and Roman architecture, we have only to examine the geometrical construction of their theaters, and there we see it brought into use more especially in a Roman theater described by Vitruvius, where he speaks of four equilateral triangles being so placed that their points must so touch the circumference of the circle which formed the ground plan of the auditorium.

That its use was known for both its advantage in shedding the rain off the roofs of buildings, and also as a matter of strength, we may see in many of the Roman buildings, especially the Roman Pantheon, and the Temple of Peace, founded by Cladius.

But it is in the Christian epoch that it has been especially used, and its different variations mark the several changes of Gothic architecture, a few of which I will briefly touch on, trusting you will patiently bear with me—a favor I shall feel grateful for. Before referring to these it may be well to see how many changes a triangle may undergo, and what figures may result from those changes. Taking the equilateral triangle described by the intersection of two circles with a common radius, and describing another triangle on the opposite side, we get what is called a lozenge; and drawing four lines at right angles to each other, and touching the four angles formed by the two triangles, we get the most perfect rectangle, being a figure the square of whose longest side is three times the square of the shorter side. Next to the square, this is the only quadrilateral figure whose sides bear any geometrical proportion to each other, and is the result of two inverted equilateral triangles.

Producing the legs of two inverted equilateral triangles formed by the two circles above referred to, we get a hexagon, being the most perfect polygon, and by the wisdom of an all-wise Creator, selected by the honey bee in the architectural construction of its cells.

Again, taking the apex of one of the above triangles as center, and one of the legs produced as radius, and describing an arc to touch where the other leg and circle meet, and doing the same with the other side, we get the oval, all resulting from the equilateral triangle.

Bisecting the sides of an equilateral triangle, and joining the points of section, we form four equilateral triangles, and from these we make the trefoil, a figure so much used in gothic tracery, a marked feature especially in early English.

Two inverted equilateral triangles, drawn with a circle, form the basis of a hexafoil for Rose windows, the finest example of which is perhaps in the south transcept of Rouen Cathedral.

For the quatrefoil we are indebted to the square, which is much used in connection with the trefoil, especially in Henry VII. chapel in Windsor, which is, perhaps, the finest specimen of Gothic architecture in England.

In tracery the isoceles triangle is much used, being already referred to as a talisman amongst the ancients; the sum of the five angles of the two triangles forming the star, being 180°, or two right angles; the sum of the three angles of the equilateral triangle being the same. This figure or star from the bases of the pentagon by joining its several points, and is much used in Gothic tracery; the best examples being found in the Church of St. Owen, in Rouen; and an example also in the Rose window in Sutter Street church in our own city. There is also an example in the Rose window at Ames Cathedral.

The right-angled triangle whose sides measure 6, 8, and 10, almost all builders are familiar with; but why those numbers should produce such a figure, or why such a figure should be governed by such numbers, require some modern Pythagorus, as this mystery remains so far unveiled.

The next triangle in geometry is called a scalene triangle, being the result of circumstances, and cuts no figure in architecture, save a good reminder never to have such about our work, which should be perfect like the equilateral triangle, and square like the right-angled triangle. I will now occupy a few moments of your time in reading the uses of the equilateral triangle in Gothic architecture.

It is worthy of remark, that while the equilateral triangle formed the basis of Gothic architecture, not only in doors, windows, and ground-plan, and in the grand and stately arches of its aisles and transcepts, but even in those delicately clustered columns with emblematical foliage for capitals that supported those vaulted canopies, the architects of those grand old buildings never lost sight of one fact that is well worthy of all future members of this profession to follow; that is, as near as possible apply the laws of geometry in our work; and whatever decoration you may be stimulated to adorn your work, let it have some object or cause; not the result of a mere whim, but based on some fundamental principle. While you go from one period to another in Gothic architecture you find the equilateral triangle used in Gothic windows; and as you leave this you next come to the lancet window, being only the change of location of the center of the arc.

You take the two equilateral triangles above referred to as forming a lozenge, and their height will give the points of the spring of the arch in windows much used in early English, which in later perods was lengthened as circumstances required.

For examples of the double equilateral triangle as used in the ground-plan of gothic churches, I would refer you to the churches of Winchester, York, Salisburg, Norwich, Exeter, and others. While I am fully aware that I have read to you nothing new, I would say that in reading over works looking for notes on the above, I have met with much that was indeed interesting, so that in this respect any of us will be well paid by getting up papers on some subject connected with our profession for our mothly meetings.

The *Carpenter*, formerly published in New York, has been moved to Philadelphia. The address is 613 Callowhill Street.

☞ $2.50. ☜

We will send the "California Architect and Building News" for 1883, and one copy of "Palliser's Model Homes," for $2.50.

The Cracking of Paint.

Last month we received a lengthy communication from a prominent carriage manufacturer in regard to the cracking of paint, and the remedy therefor. Some of the questions asked were such as to require much time and study for satisfactory answers. We have consulted some of our best-informed mechanics, and gleaned various items from our many exchanges, and trust the answer we give to our correspondent will be appreciated by all who take an interest in painting and good workmanship.

We first consider the *cause of the cracking of paint.* While around on our investigating tour, we propounded this question many times, and no two answers agreed. One would say, "You had too much oil in your paint"; another, "Too much japan." Again, "There was not enough of oil"; and a very sedate-looking individual whispered in our ear, "That the paint dried too quick."

From the mass of answers we received we have deduced the opinion that the cracking of paint on carriages, hacks, etc., is due more than anything else to the *hurried manner in which it is applied*, aided in a measure by the too liberal use of oil.

A great many painters persist in mixing their paints so as to have them elastic all the way through; by so doing, they expect to have a tough, elastic surface, that will give like rubber to the swelling and shrinking of wood. Provided the paint remained just that way, all would be well. But sooner or later, the paint is bound to dry *hard*, and when it does, it naturally contracts; when its elasticity gets to the utmost limits, the paint will give way, and spread open in large cracks. This fact is the same with the house-painter as well as those who work on carriages.

One great fault to be found with the painter is, he supposes his work to be thoroughly dry, when, in fact, it is not half-way dry. In the good old days it took six months or more, with fine drying weather, to get a job ready for finishing on the elastic principle. Now many a job is put through in less than a month, and the work is supposed to stand just the same.

There are two ways of finishing work: one on the *elastic* principle, and the other is the quick process, or *flat coating*. Few will give the time necessary for the first way. The different coats should be put on very thin, and each to be allowed to thoroughly dry before another is put on. The *flat coating* can also be hurried so that it will crack badly.

To avoid the cracking of paint, the following ideas, if carried out, will be found to work admirably. Let every part of the wood, inside and out, be properly primed with fresh priming. Let the priming get perfectly dry; then mix every coat of lead so that it will dry hard. Mix the filling with japan and varnish, so that this may dry firm and hard; use no oil in it. Have every coat dead color. Do not apply the coats too heavy; have them as thin as possible to answer your purpose, and let each get thoroughly dry before putting on another. Place enough coats on to fill the grain of the wood, making a perfect surface. Then you will have on a body of paint firmly bound together and thoroughly dry. When paint is thoroughly dry, it can shrink no more, as it only shrinks when in the process of drying; and if it does not shrink, it cannot crack.

If the paint is not well protected by varnish, it will perish in time, sooner or later, owing to how well it is protected. Once a year is enough to have a carriage varnished to be kept in order, though no rule is laid down; except when it commences to look as if it wanted varnishing, have it done. Don't wait till it wants burning off before attending to it.

Nowadays painters will paint jobs in two weeks, and wonder at the cracks. The blame is generally laid on the material, or anything else that is handy and suitable, but the real fact of the case is finishing the job in two weeks, requiring the coats to dry as hard as possible, and trust to luck for results.

☞ $10.00. ☜

We will send the "California Architect and Building News" for 1883, and one copy of "Francke's Celebrated Work on Monuments," for $10.00. Every architect and marble-worker should have a copy of this work.

Work yet to be Done.

One of our most intelligent and experienced sanitary experts has the following sensible say in a private letter—so sensible and valuable that we copy entire: Despite all the agitation of late years, it is amazing how much yet remains to be done in the line of sanitary work. When after four years spent in recommending sanitary reform I began the practical work of remedying bad drainage and plumbing, I had to confess astonishment at the small results that has been accomplished in the way of improvement. The sewer-gas scare, dating from before 1876; the two outbreaks of yellow fever at the South; the diffusion of official health document; the publication of sanitary periodicals and books, with the wide dissemination of information by the press and on the lecture platform—all seem as but a drop in the bucket, in view of what yet remains to be done. We have scotched the snake, not killed it, and the ground has been barely scratched for the seed of reform. We need to start a sanitary boom, and ought to make household hygiene as popular and attractive as household decoration. People should be impelled to search out antique nuisances and the sources of old-fashioned contagion with as much ardor as they now track "grandfathers' clocks" and carved oaken side-boards. We already see one good result of the art decoration fever, in the taste for bare floors and hard-finished walls. A sanguine man may have faith that in time a healthy house will be as much admired as an artistic one, and that even bric-a-bric may pale in glory before perfect plumbing and ventilation. The character of our people is such, and the condition of our climate so different, that we cannot always follow foreign experience in sanitary matters. Hence it is vitally important to study local conditions and requirements, and at least take the first step toward practical success by employing only men of competency in supervising sanitary work.—*The American Plumber.*

A California Tree.

The region around Guerneville, in Sonoma Co., is somewhat noted for its remarkable growth of large timber. The following account of the saw-logs cut from one of the "giants of the forests," recently felled, will no doubt be found especially interesting to our eastern friends. The details can be relied upon, as they were furnished by Mr. W. L. Van Doren to the editor of the *Petaluma Argus.*

"The standing height of the tree was 347 feet, and its diameter near the ground was 14 feet. In falling, the top was broken off 200 feet distant from the stump, and up to the point of breaking the tree was perfectly sound. From the tree saw-logs were cut of the following lengths and diameters: 1st, 14 feet long, 9 feet diameter; 2nd, 12 feet long, 8 feet diameter; 3rd, 12 feet long, 7 feet 7 inches diameter; 4th, 14 feet long, 7 feet 6 inches diameter; 5th, 16 feet long, 7 feet diameter; 6th, 16 feet long, 6 feet 10 inches diameter; 7th, 16 feet long, 6 feet 6 inches diameter; 8th, 16 feet long, 6 feet 4 inches diameter; 9th, 16 feet long, 6 feet 3 inches diameter; 10th, 18 feet long, 6 feet diameter; 11th, 12 feet long, 5 feet 10 inches diameter; 12th, 18 feet long, 5 feet 6 inches diameter. It will thus be seen that 180 feet of this remarkable tree was converted into saw-logs. As the length and diameter of each log is given, the reader can, at leisure, figure out the quantity of inch lumber the tree contains. If, instead of being cut into lumber, it had been worked up into 7-foot pickets, it would have afforded fencing material to inclose a good-sized ranch."

Can any of our mill men in the East furnish us with statistics exceeding those of the above-described "giant"?

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

ED. ARCHITECT: Will the charring of timber effectually prevent it from decaying?

W. A., Guerneville.

ANS.—If the timber is perfectly sound and well seasoned, the effect of charring will be to preserve it for an indefinite time. Should the wood be green, charring can only be expected to prevent infection, as decaying may begin at the center, and proceed, without ever appearing at the surface of the beam. This is the reason why so many fence posts that have been charred have failed to meet the expectations of those who put them in the ground.

BUSINESS MANAGER OF ARCHITECT: Will you please inform me how many feet of redwood is being shipped per month to the East? What part of the finish of the buildings is it being used for?

R. J. B.

ANS.—We will endeavor to obtain the number of feet that have been shipped in 1882, and will inform our readers in the December issue of this journal. The demand for California redwood is increasing very fast in eastern cities, especially so in New York. We confess that we would be sorry to see a large demand for this lumber east of the Rocky Mountains, as the immense drain that is now being made on our forests will in forty years from now almost decimate them of this really choice timber. It must be remembered that in each successive year there will be a much larger amount of lumber cut in order to meet the home demand; and from practical observation we do not think we have any too much timber in sight to meet the demands in the future for the use of the young folks that are now growing up around us.

Why do not some of our California inventors grapple with the problem of straw lumber. There is no State in the Union that presents so many advantages as California in regard to obtaining large quanties of the raw materials. If a ton of straw will make 1,000 feet of lumber, surely the plains of Colusa and Stanislaus can be relied upon to produce thousands of tons of straw, and therefore thousands of thousands feet of lumber. Who will be the first to move in the matter?

We believe the lumber is used principally for store finish and wainscoting, where it is desirable to have a contrast of light and dark woods.

BREAKAGE OF COLD-CHISELS.—The usual cause of chisels breaking is from overheating, too high temperature, and by striking the finishing blows on the edge. A chisel should not be finished in dressing it by hammering on the edges.

CALIFORNIA ARCHITECT: What is the difference per degree of heat between the expansion of cast and wrought iron?

ANS.—Cast-iron expands $\frac{1}{162000}$ of its length for one degree of heat; wrought-iron, $\frac{1}{143000}$.

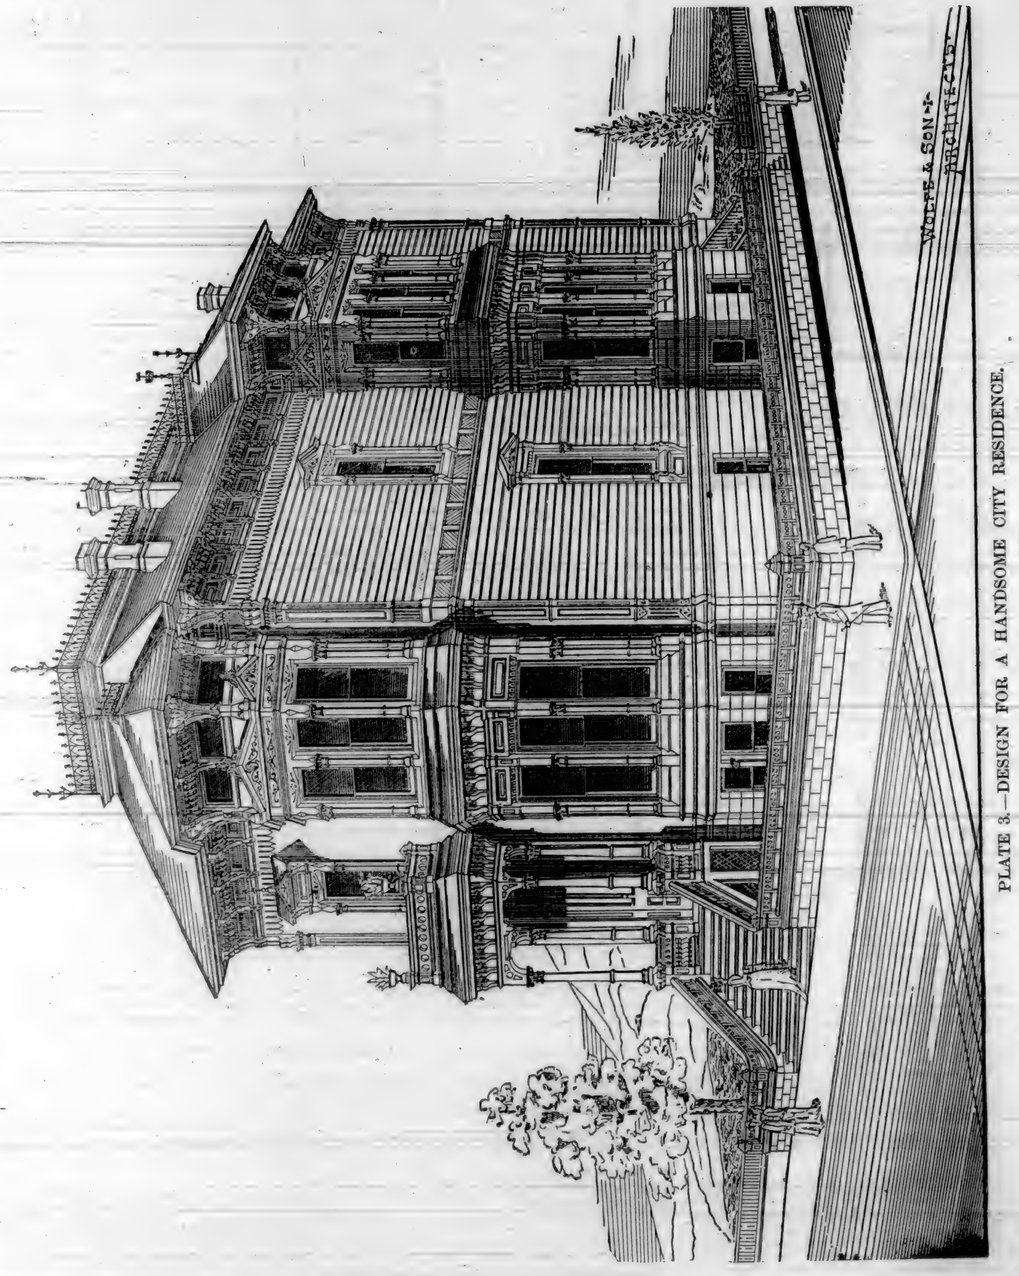


PLATE 3.—DESIGN FOR A HANDSOME CITY RESIDENCE.

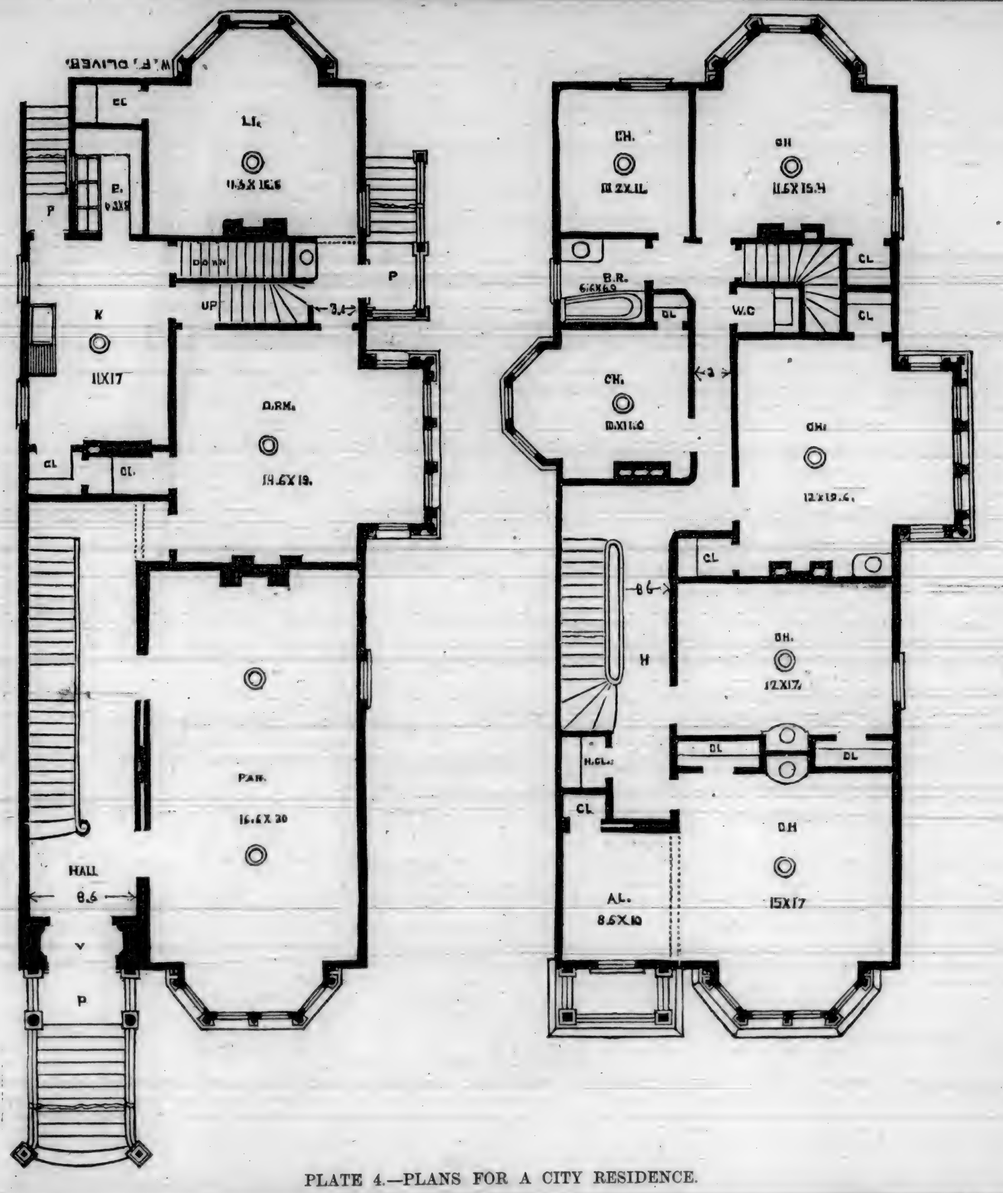

PLATE 4.—PLANS FOR A CITY RESIDENCE.

The Time to Form Clubs.

In our next issue we will give a list of papers with which we have formed business connections, and by which we can offer this journal, and any one of the really good papers published in the East, for a less sum than it will take to subscribe for them separately. We are also making arrangements by which we can give our subscribers a choice of the best architectural and mechanical books published, in connection with the "CALIFORNIA ARCHITECT," at a cost but little in excess of that of the books alone. Do not order any Eastern paper until you have either seen our December issue or written to us in regard to our terms.

☞ $5.50. ☜

We will send the "Science of Carpentry Made Easy" and the "California Architect and Building News" for one year, for the sum of $5.50.

Any one sending us 5 new subscribers to the "California Architect and Building News,' we will give one copy each of "American Cottage Homes" and "Model Homes."

☞ $4.25. ☜

We will send the "California Arhitect and Building News" for 1883, and one copy of "American Cottage Homes," for $4.25.

☞ $6.00. ☜

We will send the "California Architect and Building News" for 1883, and one copy of "Science of Carpentry made Easy," for $6.00.

Less Income from Poorly Planned Buildings.

Incompetency and lack of good judgment, and absence of right understanding of actual necessities, are often clearly manifest in the erection of buildings; and if a correct computation of the yearly losses to owners of buildings within the United States in rentals and income from their real estate improvements, resulting from inexcusable and unpardonable errors committed in the conception, maturing, and carrying out of the plans adopted, compared with what might have been accomplished at comparatively trifling advance, and in some cases actual less cost, could be reached, the total would assume proportions sufficient to build an entire city like that of San Francisco every year.

Of course, every man has a right to do as he pleases with his property, but when he does that which, to his neighbors and passing observers, appears unwise, unæsthetic, and practically less good than it might have been, his acts naturally become the subject of criticism; and he should not feel aggrieved even though rated by some one as a "stupid."

The "bump" of economy in many individuals is by far too largely developed; and, becoming a controlling influence upon the mind and nature of the person, leads to numerous errors. It seems to us, that if some men and women could but realize how ridiculous and sometimes contemptible they make themselves appear to others, and how much they compromise their own interests by the persistent application of a fancied economy—cheap—rule of action, i. e., asking, expecting, and requiring more for a stated consideration than is just and fair, they would resort to more reasonable and sensible methods, and accept the gilded rays if not the full splendor of the golden rule—"Do unto others as ye would have them do unto you." But this is next to impossible to some people; hence, in the matter of erecting buildings, the smaller elements of human nature assume control, and all that is done is tinctured if not overwhelmed by illiberality and unfairness—a disposition to obtain a dollar's worth in every connection for sixty cents, more or less, according to the degree of inequity actuating.

Consequently, the "cheapest architect" is hunted up: cheapest simply in the abstract use of the term, but in all essential respects often the most expensive by a thousand per cent. Yet the proffer of services at low rates enchants the seeker of "cheap" commodities; and the veriest knave or blockhead calling himself an architect often secures engagement against the better and far more competent man, who, honoring his profession, entertaining a due regard for its dignity, and recognizing its responsibilities, refuses to accept insufficient compensation for his services. The result that follows is twofold: the owner is deservedly financially injured, sometimes to a large amount, through the incompetency of his cheap architect to conceive or execute good, practical, and proper plans for the improvement contemplated; or, if not so, he is made to pay the full and proper commission of five per cent. or more in other ways, so that the cheap man finally laughs at the exacting client, and enjoys all the financial benefits—perhaps more than the rejected architect who demanded in the premises fair and right remuneration for his services.

No one enjoying fair business intelligence can, upon any right business hypothesis, presume for one moment that men who undertake obligations at less than compensating rates can afford, in justice to themselves, to be scrupulously correct in their transactions. The thing is absurd. And these men who, as architects, huckster their services at nominal prices, and in addition pay large percentages to solicitors, who hunt up, and in innumerable cases persecute, owners by persistent solicitations, cannot afford to respect the right, proper, and defensible rules of integrity and correct dealings. They must have money sufficient to meet the numerous contingencies; and, strange as it may appear, some who have uniformly undertaken architectural works, not only below the regular rates of charges established by the architectural societies the world over, but for less than actual cost of preparing plans, specifications, details, etc., have grown rich. This *fact* needs no comment; it carries its own explanation.

But this rule of economy is carried beyond the architect, and enters into every transaction connected with the operation in hand. The effort to secure cheapness in materials and workmanship of every class is persistent, and often accompanied with the absurd proposition of first-classedness, a something which, under the circumstances, is not possible, and the demand for it simply betrays the ignorance of the party demanding. But those extreme economists, generally being in themselves first-class misunderstanders of right and fair things, are easily humbugged into the belief that their cheaply obtained results are first-class, even though destitute of a single first-class quality or feature, and the delusion to them is as good and satisfying as would be the genuine article.

☞ $10.00. ☜

We will send the "California Architect and Building News" for 1883, and one copy of "Francke's Celebrated Work on Monuments," for $10.00. Every architect and marble-worker should have a copy of this work.

White Lead and Zinc.

The carbonates of lead is the purest form of white lead known to the trade, and it is therefore used by painters where great body or covering quality is desired. This form of lead, when ground pure in linseed oil, is not permanent; it eventually succumbs to the action of solar heat. It would last far longer if painters were to use a *coarse grade*, which would admit the oil between the particles, thus affording a clinch or bind for the oil, when the duration of both oil and lead would be extended. It is a great mistake to suppose that because acetic acid is used in corroding lead that it remains to act upon other substances; for the simple fact of its union with oxide of lead it is lost in the carbonates of white lead; and when levigated and ground it is a pure carbonate and not an acetate of lead. The grinding of white lead to a fine, impalpable powder has a great deal to do with its stability when compounded with oil and exposed to the weather. It will last longer when stained or colored with earthy mixtures; but when applied as a white paint to surfaces of sunny exposure, it will chalk in two or three years. At this stage its decay is rapid; and if not recoated it will be soon blown or washed away. The causes which tend to the rapid decay of the carbonate of lead and oil are solely due to their constituent gases of which they are composed. The oil is composed of carbon, hydrogen, and oxygen, and when applied as above in their coatings on exteriors of buildings, the oil in drying absorbs oxygen from the air, and the white compound becomes hard and firm to the touch. The affinity of the oxygen in the oil to that in the air is fatal to the solidity of the mixture or paint, though the oil by it becomes a solid. The action is not like that of the volatile oils; but instead, it absorbs or takes from the atmosphere large volumes of oxygen, and by it disengages the carbon and hydrogen, leaving a disintegrated mass of lead and resin. This tendency of seed oils is further demonstrated by the spontaneous combustion of various substances when besmeared with these oils. Therefore, if there is no other protector present, pure white lead is sure to be left to the mercy of the elements. The use of raw or boiled linseed oil as the vehicle to bind the lead makes but a very little difference in the lasting qualities; but the harder the oil dries, the more durable the lead will be. The process of oxidizing the lead cannot be improved to any extent or advantage to the painter, and as to corroders, the mode now used is about the same as that of the old Dutch process. Climatic influences hasten or retards the durability of white lead. In semi-tropical countries the oil disintegrates so rapidly that white lead will not be serviceable more than half the time that prevails in a more temperate zone. The hardness of zinc has induced many painters, as well as some manufacturers, to incorporate the zinc with white lead, in order to have an article which will extend the durability of the carbonate of lead. There is as yet no formula by which the proportions can be agreed upon; for some think a mixture compounded with one-half zinc, and others that a one-third proportion, would be sufficient to harden without affecting the body of the lead. To this latter view we are inclined to admit it as a corrective in sunny exposures. In such cases, a small proportion of blanc de zinc, thoroughly stirred into a mixture of pure white lead, will no doubt change the nature of its chemistry sufficiently to give to the compound a more lasting quality. J. E. W. C.

Indiana Walnut in 1834.

In the course of a recent conversation concerning Indiana timber in general and walnut in particular, with one of our pioneer settlers who came to this country in 1834, says the American *Wood-worker*, the old gentleman remarked: "The walnut timber used to be a great deal of bother to us in those days. In clearing our lands we usually felled the trees, then rolled them into log-heaps and burned them. Walnut was the meanest wood of all, as it was almost impossible to burn it. I knew a neighbor to spend the best part of some three weeks trying to reduce an immense walnut tree to ashes. Some years later there was a saw-mill erected a few miles away, and the owner bought a great deal of timber, some of which he sawed up, but most of it he shipped in the log to Cincinnati. I had sold him considerable timber, when one day he came to me and asked what I would take for a large walnut tree that had fallen in a swamp a year or two before. I told him he might have it for nothing if he would take it out of the way. He told me afterwards that he had made quite a little sum out of it; but had I that tree now I could sell it for $400. Many and many a fine walnut tree did we cut for a coon. We had no particular use for walnut then. It was in the way, and we took the quickest and best methods of getting rid of it. Sometimes we made rails of it, but it was frequently so curled and twisted that it was impossible to split it. We would probably have ridiculed the idea then that these curled and twisted logs might some day have made us wealthy, or that a big walnut knot would ever have any value."

The smallest circular saws in successful use are those used in cutting the center slit in steel pens. These saws are no larger than a nickel piece, and not thicker than common paper, and yet they revolve about 4,000 revolutions per minute. The rigidity, notwithstanding their thinness, is due to this high rate of velocity.

BUILDER AND WOOD-WORKER, CARPENTRY AND BUILDING, BUILDING.

Either of these journals, in connection with the CALIFORNIA ARCHITECT AND BUILDING NEWS, will be sent to one address for $2.50 per year.

San Francisco Chapter American Institute of Architects.

The regular monthly meeting of the Chapter was held November 3rd, 1882. A large number of members was present. Vice-President Wm. Curlett presided. Minutes of preceding meeting were read and approved.

E. J. Molera and Joseph Gosling were elected members of the Chapter. Proposition of W. Ferris to become a member as Draughtsman was received and referred to a committee.

Committee on Articled Students reported progress. It is the intention of the committee to send communications directly to the practicing architects of this district, stating the objects and benefits to be derived from following the plans proposed, and thus secure a full list of the Articled Students in the profession.

The trustees were instructed to take the necessary steps to have this Chapter incorporated under the laws of the State of California.

The Chapter then had the pleasure of listening to a very able and instructive lecture by John Gash, Esq. His subject was "THE TRIANGLE." Mr. G. handled the subject in a masterly manner, and the lecture throughout showed evidence of much careful study on his part. After the lecture, the speaker illustrated his ideas upon the blackboard. A vote of thanks was tendered Mr. Gash for his able effort. The full speech will be found in another part of this issue.

James E. Wolfe made a few remarks upon the subject of "DRY ROT IN TIMBER," and promised the Chapter, in the course of three months, to deliver a lecture either upon that or some kindred subject.

Responsibility of Architects.

A rather singular case is considered in the article on Jurisprudence of Building in the last number of *La Semaine des Constructeurs*, which contains so exact a statement of the extent of the responsibility of architects as to be worth a brief mention. It seems that a certain architect was employed by a proprietor residing at a distance to build a villa. The first estimate of the cost amounted to twenty-two thousand francs; but this was revised and increased to twenty-five thousand. The actual expense of the building, including additions of fencing and shed, was forty-two thousand francs. The architect brought in a bill for commission on the whole forty-two thousand francs, which the owner refused to pay, offering, instead, the usual percentage on the estimated cost of twenty-five thousand. This the architect declined to accept, and claimed his whole bill. The proprietor then, to justify himself for refusing payment, represented that the architect had injured him in various ways. In the first place, he had spent on the buildings nearly twice his original estimate; in the second place, he had failed to exercise proper care: in ordering double sashes and blinds in places where they were unnecessary; in planning corridors in the interior of the house only twenty-three inches wide, so that they could not be used for passage-ways and needed to be enlarged; and in allowing a beam to be built into a chimney, under a fireplace, which could not be used in consequence. In view of these things, the proprietor demanded that the architect should pay the lost of enlarging the corridors, damages for the loss of the use of the fireplace, and reimbursement of the cost of the unnecessary outside sashes and blinds; besides the expense of modifying a lighting-rod, which was asserted to have been improperly placed. The correspondent who asks the opinion of *La Semaine*, and who seems to be an impartial observer of the dispute, adds that the assertions of the proprietor in regard to matters of fact were correct; but that he had inhabited the house for two years without making any complaint, and that it was not until the architect had sent in his bill that his sufferings seemed to begin.

To this statement of the case *La Semaine* makes reply, that in general an architect is at fault if he omits to supervise the works under his charge with due care; if he allows the building to be erected on a bad or yielding soil; if he permits the use of improper materials; if his plans indicate weak or vicious construction; and if he neglects to require the observance of the public laws and regulations, as well as of any conditions or restrictions concerning which his employer has given him notice. Whether the fact that the cost of the construction exceeded the estimate should be regarded as a fault on the part of the architect depends, says *La Semaine*, upon circumstances. If the architect, unknown to the proprietor and without his authority, should bring him into expense, the latter would naturally refuse to pay the cost of the extra work, and the question of responsibility should then be decided; but as the architect has unquestioned authority to order the execution of extra works asked for by the proprietor or arranged with his consent, the fact of its having been paid for without remonstrance was evidence that the additional work in the present instance was carried out by the architect with at least the assent of his client, and in this case he was entitled to commission on the whole cost. For vicious constructions required by the drawings or permitted by the architects, he was certainly responsible, and both he and the contractor were jointly liable for damage caused by building in the beam under the fireplace; but in regard to the sashes and shutters there might be a question as to their superfluous character, and the twenty-three-inch corridors, although unusual, could hardly be classed as constituting a vicious construction, particularly as the proprietor did not notice the inconvenience of them until he had lived in the house for two years.—*The American Architect.*

☞ $5.50. ☜

We will send the "Science of Carpentry Made Easy" and the "California Architect and Building News" for one year, for the sum of $5.50.

A Builder's Foreman.

To begin with, a foreman must be a skillful workman, or it will manifestly be impossible for him to direct those who are placed under his control and guidance. Indeed, unless a foreman be capable of taking his place among a number of workmen, and by quickness of perception, carefulness, and the exhibition of superior manipulative skill, proving to them that he has a perfect mastery in these directions, his authority over them will be minimized. Workmen are appreciative in the highest degree of real talent and knowledge in their leaders; but so, also, they are not slow in exhibiting their contempt for those who merely assume such characteristics. When a foreman has demonstrated his capabilities for laying out work, and in arranging the various processes for completing it, he has done much towards insuring successful results, and he will gain the respect alike of master and man. Further, a good foreman should become thoroughly conversant with the peculiarities of construction and the action of machines and machine tools, of which so many varieties exist, and which are of infinite importance as to economy of time and money. Without such accurate knowledge he could certainly not estimate, with any degree of exactitude, the amount of duty to be obtained from the use of such appliances, nor the approximate cost of the work to be done by them.

In conducting and governing properly the multifarious duties of the workshop or the factory, a ready method of delineating forms and of thus conveying to others through the medium of the eye his own ideas of pieces of mechanism or of the details of machinery, is a necessary accomplishment for a foreman. By such means he will readily instruct his men, and that in a manner which no mere verbal explanation would make intelligible. Pencil and chalk discreetly used by the foreman thus become one of the most forcible and plain teachers of workmen.

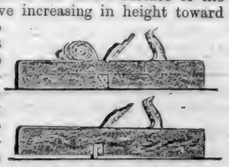
The previous training and experience of the latter prepare them to understand sketches; and thus he who can best produce the latter economizes the time of all concerned, and saves his employers from needless expense.

The power of making diagrams with precision and rapidity is, in fact, an invaluable acquisition for the leader of a staff of mechanics. It is a qualification which, like many others requisite for making a really efficient foreman, can only be gained by constant practice; and we most earnestly advise those young workmen who aspire (as all should do) to come to the front and "take the lead," to miss no opportunity for acquiring it. A fair knowledge of geometry and arithemetic and of the nature of the materials employed in works of construction is simply indispensable. The foreman, too, must be possessed of prompt energy and of a readiness of expedient so as to enable him to grapple successfully with emergencies and overcome practical difficulties that may crop up unexpectedly, as subsidences of foundations, break-downs of machinery, etc.

A duly qualified foreman will find no difficulty in deciding as to the length of time which should be occupied over any detail placed for completion in the hands of a workman under him, for he knows how long it would take him to do it himself. It would be easy to extend our remarks upon the practical essentials of good foremanship, but it seems scarcely desirable to do so; and therefore, with a word or two as to moral requirements, we will conclude. Among these last stand out prominently a love of truth and a total absence of duplicity. Let it be generally known that a foreman is above and beyond acting or speaking otherwise than conscientiously, and his moral power will be great indeed. Faith will then be placed in his judgment; and while working people will, as a rule, repay him with respect and ready obedience, employers will as certainly repose in him the utmost confidence.

Improved Bench Plane.

The improvement consists in a stirrip pivoted to the sides of the plane in such a manner that the cross piece of the stirrup passes through a transverse groove in the under surface of the plane, this groove increasing in height toward the rear of the plane, so that when the plane is drawn backward it will be slightly raised by this stirrup, so that the cutting-edge of the plane iron cannot slide on the board being planed, the object being to prevent dulling the cutting-edge of a plane iron by the backward movements of the plane. The upper figure of the engraving shows the position of the stirrip while the plane is being moved forward, and the lower figure shows the plane as lifted by the stirrip during its backward movement. This invention was recently patented by Mr. Geo. F. Sawyer, of Livingston, Tex.



☞ $3.50. ☜

We will send the "California Architect and Building News" for 1883, and one copy of "Palliser's Useful Details," for $3.50.

Our Illustrations.

Plates 1 and 2 are fully explained under our article on the Steel Square and its uses.

Plates 3 and 4 are the plans and elevation of a handsome city residence. The plan is well worth study. There is no waste room in the house, every inch being utilized. The house can be built on a narrow lot, and therefore explains why the space was so economized. The cost can be made to vary so much that we will merely say, by leaving off the basement, it could be built for from $7,000 to $10,000. With the plan as shown, $3,000 added to the latter figure will be the cost in San Francisco.

Plate 5 is the plan and elevations of a commodious suburban residence. It can be built for about $7,000. The cut was made by the Mechanical Co., of New York.

Franke's Monuments and Headstones.

This work consists of 40 folio plates and contains 76 designs, giving elevations, plans, and accurately drawn details of moldings and ornamental parts. The geometrical elevations and plans are drawn to scale, and perspective views are introduced to show the general effect when executed and in place. Substantially and elegantly bound in half morocco. Price $9 per copy (reduced from $12), postage paid.

We can furnish any book or periodical on Architecture, Building, and Mechanics, published in this or any other country. In fact, we can furnish any kind of book published, on receipt of publisher's price.

Science of Carpentry.

A work that every mechanic should have. It is designed to make the science and art of carpentry clear, and comparatively easy to all who require information on the subject. Sent post-paid to any address upon receipt of $5.00.

Indexed Atlas of the World.

But one copy remains of this magnificent work. They are not for sale in any bookstore, and it is but seldom that a copy can be had. This last copy is bound in half-morocco, and will be sent post-paid upon receipt of the price, $35.

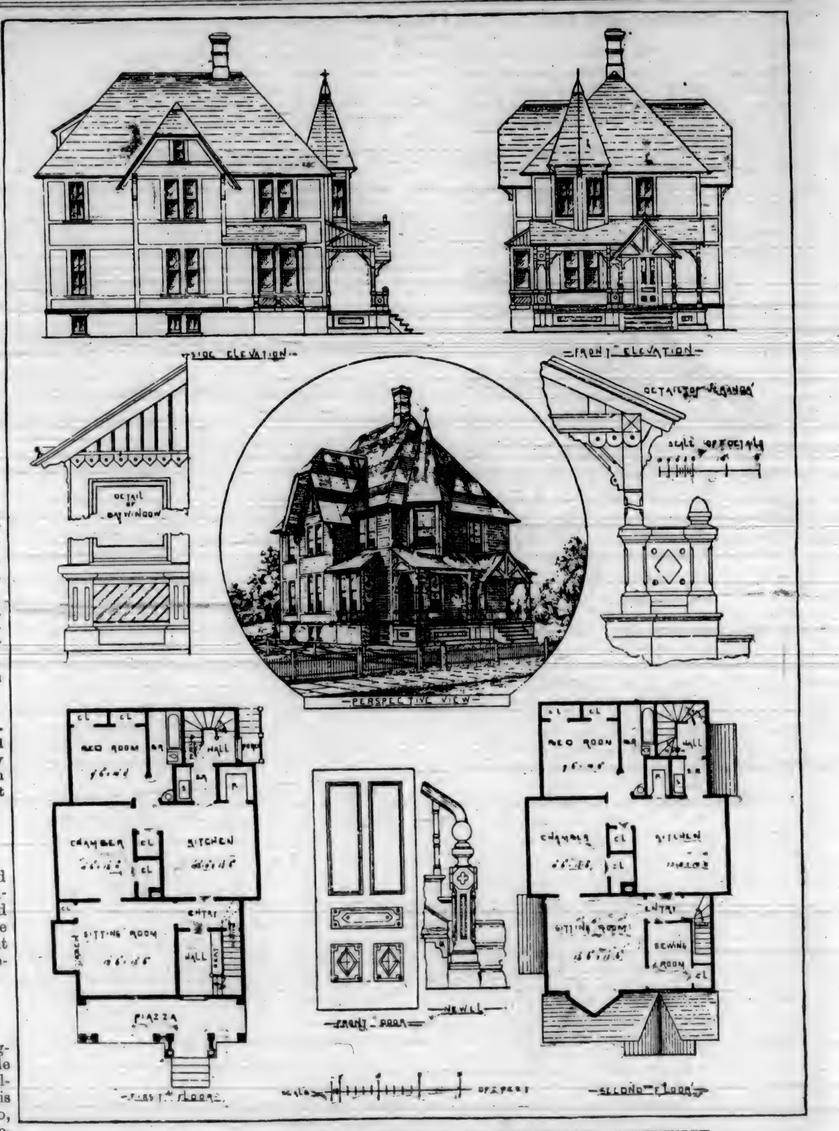


PLATE 5.—PLANS AND ELEVATIONS OF SUBURBAN RESIDENCE.

IVES' PATENT DOOR BOLTS.

Sold by all Hardware Dealers.

(APPLIED WHOLLY BY BORING.)

HOBART B. IVES, NEW HAVEN, CONN.

Sole Manufacturer and Patentee.

As we predicted a year ago, the introduction of the above celebrated bolts is driving all the poorer quality entirely out of market; and wherever one goes on the Pacific Coast, he will find the Ives patent to be *the* popular safeguard against the intrusion of burglars. They are for sale by all of our principal hardware dealers.

The Barrel.

A gentleman who has been reading upon the subject says that the invention of the barrel, made of strips of wood, and rendered tight and strong by hoops, finds in history no notice of origin or inventor. Pliny attributes it to the Gauls of the Po, in Lombardy. There is, however, good reason to believe that the barrel was in use before the Gauls reached Italy, perhaps before their existence as a people. In one of the inscriptions copied by Wilkinson from Egyptian monuments may be seen two slaves emptying grain from a wooden-hooped vessel, while a scribe keeps tally and a sweeper stands by to sweep up the kernels. Close by, a poor victim is undergoing the bastinado, for a short measure or petty theft. The measure is barrel-shaped, precisely like the *kaye* of modern Egypt, and would apparently hold about a peck. The age of this inscription is not indicated.

First-Class Journals.

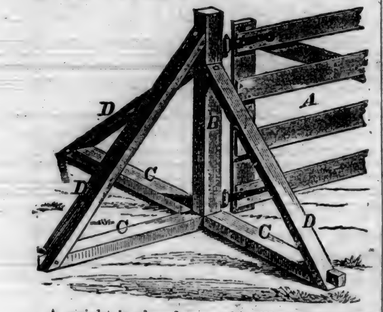
BUILDER AND WOOD-WORKER, CARPENTRY AND BUILDING, BUILDING

We will send either one of the above journals, and the CALIFORNIA ARCHITECT AND BUILDING NEWS to one address for one year, for $2.50. Send in your orders immediately.

Improved Gate Post.

Mr. Wm. H. Taylor, of St. Louis, Mo., has lately received letters patent on an improved gate post, which we illustrate in the accompanying cut. The design of the invention is to have supports so constructed that they will prevent all sagging of the gate.

The post B consists of a triangular lever, having a base or sill piece C, and an inclined piece D. The sill piece rests upon the ground, and its inner end abuts against the post. One end of the inclined piece is secured to the post at or near its top, and its other end is secured to the sill piece at or near its outer end.



A weight is placed upon the sill piece between the joint of the two members and the post. In prairie countries the weight may consist of a box filled with dirt. This device may by applied to old posts already in the ground, or to a post when the gate is first swung.

The inclined piece may be secured to the post and to the sill piece in any desired way. One of these supports may be applied to each of the three sides of the post, the gate being swung to the other side, and thus support the post in all directions.

Expert Judges in Competitions.

A correspondent asks us whether any means can be invented "to teach committes who have public buildings in charge that a gratuitous competition without expert judges will not bring them a single design worthy of execution." To this we can reply at once that there is a very effectual means for accomplishing the desired end, and that is, the refusal of reputable architects to enter such competitions. As soon as it is understood here, as it is in other civilized countries, that no architect will respond to any invitation to compete except on the terms recognized by the profession—that the award shall be publicly made by experts of reputation, and that the execution of the building, or other structure, at the usual commission, shall be confided to the winner of the competition—then, and not till then, shall we see the last of the ridiculous, unfair, and disgraceful scrambles which are maintained by the folly and at the expense of those architects, particularly the younger ones, who imagine that they are to obtain some private advantage by degrading themselves and betraying the interests of the profession, for the benefit of persons who, to say the least, will not be rendered more scrupulous in treating them by witnessing their own disloyalty to their fellows. There is in this country plenty of work for all the architects in it to do, at a fair remuneration. No one else can do it, so that they are sure of the employment, and if they choose to do it for less than it is worth, they have only themselves to thank. A beginning has already been made in St. Louis, by an agreement of a large number of architects to have nothing to do with competitions where certain proper conditions—the appointment of expert judges among them—are not complied with. If a similar understanding could be arrived at between the architects of other places, we should soon see a great change in the conduct of competitions, which, instead of artifices for deluding, cheapening, and degrading the profession, would become the recognized and honorable means for introducing the younger architects to lucrative practice, while the established and busy ones, in return for the loyalty of their juniors, would gladly lend their influence in sustaining these against the attempts of astute selfishness to take advantage of their youthful hopefulness and lack of caution.—*American Architect.*

$3.50.

We will send the "California Architect and Building News" for 1883, and one copy of "Palliser's Useful Details," for $3.50.

Visiting Shops and Learning New Wrinkles.

The worst-conducted and most unprofitable machine-shops are those whose proprietors are chronically averse to adopting any ideas originated in other establishments than their own. In these days of rapid mechanical progress, it is only a question of time as to the rotting out or failure of such concerns. A knowledge of new ideas and improved methods of doing shop-work can usually be obtained, if sought for in the proper direction, but that knowledge is not likely to be pressed upon shop-owners by those originating the improvements, except when they are secured by patents or otherwise, as private property. While the most notable of these new devices and processes are set forth publicly by the technical press, there are a great many valuable ones that are, for obvious reasons, not fully explained (only attention called to them) in print, and that are free to be adopted by any one, without royalty or any other expense than that of putting them into use. To lay hold of these kinks and devices, it is only necessary to visit shops where they are originated or applied. The usual excuse of "no time to get away" ought not to be strong enough to prevent foremen, superintendents, and proprietors from making occasional journeys to other machine-shops, either near by or some hundreds of miles distant, observing how they do work, and comparing general methods and even smaller details.

Hardly a machine-shop in the land could fail to be benefited by the introduction of more or less of the devices brought out in other shops. The best and most successful shops are those that realize this fact and act upon it. They search for new methods for facilitating good work already used elsewhere, as well as originate such methods themselves. A foreman or superintendent could profitably pack his gripsack, and spend a week in visiting shops every six months, if the knowledge of improved processes brought back each time should enable him to turn out work faster and better than before.

As a rule, machine-shop proprietors are ready and willing to afford visitors every opportunity to see what is going on in their establishments. It is worthy of note that those whose productions have the widest and best reputation are most courteous and obliging in their treatment of visitors, including all who come to acquire new ideas to put into practical use. True, they often furnish their competitors gratis with many useful plans and methods of manufacture, but the general good-will and mechanical reputation thereby created more than repays them for the original ideas so freely imparted. In some of the most highly esteemed machinery establishments in this country, whose names are regarded as synonymous with excellence of production, especial pains are taken to escort visitors through the various rooms and departments, and to explain every machine or process of doing work with which the visitor wishes to become acquainted. The time thus taken from work and tendered free to visitors is worth, in a large shop, considerable money every year; but, valuable as it is, the proprietors find it greatly to their pecuniary interest to keep up the custom.

By so doing, a few of them have acquired not only an excellent reputation in every part of our own country, but, as well, in all enlightened countries abroad, the money value of which it would be hard to estimate.

Occasionally a machine-shop has secrets to guard and will not admit visitors, but their number is few, and the secrets almost always leak out.

This is a good season to make a tour among machine-shops, with a note-book and pencil, gathering "points" for practical application.—*American Machinist.*

Usefulness of Trade Journals.

The encouragement of trade journals augurs well for the advancement of manufactures. No matter how skilled may be a workman, his fellow-craftsmen possess secrets of which he is ignorant, and which can, as a rule, only receive their proper dissemination by being published in the specialty or technical papers that are doing so much for the elevation of the American artisans and their numerous callings, in which the public is so intensely interested. Every mechanic who prides himself in his particular line ought to subscribe regularly to a trade journal—one representing most closely the branch of work in which he is engaged. This should be read closely and carefully, and the hints and suggestions thrown out must be noted with the view of giving them practical tests. By pursuing this commendable course, a greater degree of technical skill is acquired at a trifling expense of time and a small outlay of money. Then, too, a knowledge is obtained as to the better class of new text-books appearing from time to time bearing on the exact sciences and applied mechanics. Beside all this, the general news of particular localities as to the progress thereof is an especial feature characterizing these papers, of which sight cannot be lost without detriment to the loser. To be well posted is as much stock in trade with a mechanic as to a merchant or professional man. The trade journal is fast becoming, under wise and careful guidance, as much of a necessity as the daily paper.—*Western Industrial Journal.*

Keep the Cellar Clean.

A great deal of sickness families suffer could be easily traced to the cellar. The cellar not unusually opens into the kitchen; the kitchen is heated and the cellar is not. Following natural laws, the colder air of the cellar will rush to take the place of the warmer and therefore lighter air of the kitchen. This would be well enough if the cellar air was pure, but often it is not; partly decayed vegetables may be there, or rotten wood, etc. The present time is opportune for a thorough cleansing of the cellar. A day should be taken to throw out and carry away all dirt, rotten wood, decayed vegetables, and other accumulations that have gathered there. Brush down the cobwebs, and with a bucket of lime give the walls and ceiling a good coat of whitewash. If a whitewash brush is not at hand, take an old broom that the good wife has worn out, and spread the whitewash on thick and strong. It will sweeten up the air in the cellar, the parlor, and the bedrooms, and it may save the family from the afflictions of fevers, diphtheria, and doctors.—*American Artisan.*

Scarcity of Back Numbers.

Two months ago we put into execution a plan that we had been maturing for some time; viz., the issuing of a mammoth supplement to the CALIFORNIA ARCHITECT AND BUILDING NEWS. Twenty-five thousand have been distributed all over the Pacific Coast. Since the issuing of the supplement we have been more than pleased with the goodly number of new subscriptions that have poured in upon us, the result flowing from a judicious distribution of the mammoth edition of our supplement.

We were hardly prepared, however, for the large demand made upon us for back numbers of the CALIFORNIA ARCHITECT. We would say in all earnestness to those who wish to secure a complete series of this journal that they will have to send in their orders in a very short time, or else we will be unable to fill them. But few copies are left of several dates, notably that of September, 1881. In that number we gave the most complete HISTORY OF THE STEEL SQUARE that has yet been published. Nearly all of our leading journals copied the article, either in full or gave copious extracts from it. This fact alone shows that the time necessary to compose the article was well spent, and of substantial benefit to thousands of readers.

Forward your orders early. Thirty-two copies are all that remains of two different months, and twenty-one copies of the date referred to.

We have but very few bound volumes left. When these are disposed of it will be impossible for us to fill any more orders. We will send, post-paid, to any part of the United States a bound volume of either 1880 or 1881 for $2.50.

Its Influence for Good.

We do not desire to arrogate to ourselves any more credit than is our rightful due, in connection with the publication of this journal. But it must be clearly evident to every intelligent observer who is familiar with the conditions existing in this city, in connection with building, mechanical, and sanitary matters, prior to and during the first year of this journal's existence, and the very much improved state of affairs at the present time prevailing in the same connection, that a great change has by some means been brought about, better general understandings established, and a common desire created to correct abuses which had grown upon and insinuated themselves into every branch of the building interests. The architectural profession and the mechanical branches have never appeared to better advantage than at the present time, although there are still numerous improvements necessary to complete a reasonably perfected order of things, which we trust will, at least in part, be brought about in time through the columns of this journal.

The reason for this is self-evident. Prior to 1879, the year of its first issue, there had been no publication issued upon this coast in the architectural and building interests; and both the professional and mechanical interests were without any influence calculated to correct and hold in check the bad, or to encourage the better inclined in efforts to build up right and honorable methods of procedure; consequently a business demoralization ensued, and irregularities were as often the rule as the exception.

What we claim is this: that within the past three years, within which time this journal has gained its present enviable position as a representative publication, the members of the profession in this city and throughout the entire coast have been drawn more closely together, and relationships and friendships established which had never before existed; and hundreds of contractors in the various branches have acknowledged the goodly influence of our humble efforts.

We desire to be prudent and moderate in our claims, and make them a matter of comment at the present time with no more than prudently selfish motives; for neither our own nor the acts of any other human beings are entirely free from a degree of selnshness; but so long as that motive is controlled by fair and right considerations of the interests of others, it is legitimate and commendable. If, then, we have accomplished *some* good in the past, and rendered ourselves worthy of confidence, why should we not receive that undivided and hearty support which will enable us to accomplish still greater good, and secures to us the available means which will strengthen our hands and embolden our hearts in the work thus far so successfully prosecuted?

It should be borne in mind that whatever is done to create and sustain healthful influences of any character works to the benefit of those who lend the helping hand. And if, by our untiring exertions, we have rendered ourselves worthy of the approval thus far received, and our purse is replenished through our labors, our recompense is well earned and fully due; and none should do otherwise than congratulate us upon the success of the enterprise which returns us a little recompense in coin, and yields so many benefits to our kind readers.

☞ $4.25. ☜

We will send the "California Architect and Building News" for 1883, and one copy of American Cottage Homes," for $4.25.

To Build a Chimney that will not Smoke.

The chief point is to make the throat not less than four inches broad and twelve long; then the chimney should be abruptly enlarged so as to double the size, and so continued for one foot or more; then it may be gradually tapered off, as desired. But the inside of the chimney, throughout its whole length to the top, should be plastered very smooth with good mortar, which will harden with age. The area of a chimney should be at least one-half a square foot, and no flues less than sixty square inches. The best shape for a chimney is circular, or many-sided, as giving less friction (brick is the best material, as it is a non-conductor), and the higher above the roof the better.

Whiffs of Sewer-Gas.

A good deal has been said at various times about the terrible effects which may be expected to follow a whiff of offensive gas inhaled in passing a sewer grating in the open street. There are no facts known to medicine which justify the belief that such a whiff would have any effect at all. If stinks could kill, the inhabitants of London would speedily undergo a serious diminution of numbers, and many foreign cities would be left as desolate as the ruins of Palmyra. The high probabilty is that those sewer-gases which are the most offensive to the nose are the least likely to be deleterious, if *only on account* of the haste *which is made to escape from them, and of the impossibility of their presence being unperceived.* That they should be injurious to passers-by, except to the extent of producing nausea or disgust in some delicate person, seems inconceivable, especially when it is considered how largely and how rapidly they became diluted with air as they escape and are thus exposed to the chemical influence of the great purifier, oxygen. A far more subtle enemy to health, whether at home or at the seaside, is to be found in the oftentimes cherished presence of what may be comprehensively called household dirt. The dirt of an ordinary house, the dirt which may be wiped from the walls, swept off the furniture, and beaten out of the carpets, would be sufficient, if it were powdered in the form of dust over the patients in the surgical wards of a great hospital, to bring all their wounds into a condition which would jeopardize life. It cannot be supposed that such dirt is innocuous when it is breathed or swallowed, and it certainly possesses the property of retaining for long periods the contagious matter given off by various diseases.

Grimshaw on Saws.

A dear, good old friend, clothed in bright, new garments, has found his way to our desk. While engaged in answering our many correspondents, the postman gently deposited a neatly wrapped book on our mass of correspondence, and we dropped our letters in order to give friend Grimshaw's work a true California welcome. Robert Grimshaw has done nobly in producing such a work; and Claxton & Co. of Philadelphia deserve well-merited praise for the remarkably neat and clear style in which they have gotten up this book. It must have taken years of close study and inquiry to enable one to produce such a work as "Grimshaw on Saws." In it are given details of the manufacture of every kind of saws known to the trade; the proper methods of filing, setting, swaging, gumming, etc.; the care and uses of saws; tables of gauges; capacities of saw-mills; lists of saw patents, and other valuable information. The work contains 280 pages, and is illustrated by 354 cuts. The latter are far superior to those of any other work of a similar character published. We will take pleasure in showing this work to any of our patrons. The price of the book is $4.00. We will send a copy to any address upon receipt of the price. Every mechanic and millman on the coast should have one in his library.

Curiosity of Tree Growth.

An interesting observation on tree rings is recorded by Prof. Bachelart in *La Nature.* During a visit to the ruins of Palenque, Mexico, in 1859, M. Charnay caused all the trees that hid the façade of one of the pyramids of the place to be cut down. On a second visit in 1880, he cut the trees that had grown since 1859, and he remarked that all of them had a number of concentric circles greatly superior to their age. The oldest could only have been 22 years of age, but on a section of one of them he counted 250 circles. A shrub 18 months old at most, had 18 concentric circles. M. Charnay found the case repeated in every species, and in trees of all sizes. He concluded that in a hot and moist climate, where nature is never at rest, it may produce, not one circle a year, but one a month. The age of a monument has often been calculated from that of trees that have grown on its ruins. For Palenque, M. Larainzar calculated 1,700 years, having counted 1,700 rings in a tree. M. Charnay's observation requires the number to be cut down to 150 or 200 years, making a considerable difference, a matter of 1,500 years. Prof. Bachelart asks whether M. Charnay took account of certain colored rings which some tropical trees present in cross section, and which are to be distinguished from the annual circles.

BUILDER AND WOOD-WORKER, CARPENTRY AND BUILDING, BUILDING.

Either of these journals, in connection with the CALIFORNIA ARCHITECT AND BUILDING NEWS, will be sent to one address for $2.50 per year.

Give the Boys a Chance.

How many boys who, having chosen a trade and entered into their apprenticeship, have been doomed to remain inferior workman, because of being denied a fair opportunity of developing the best that was in them, would be hard to estimate. The young apprentice, if he is satisfied with the trade he has chosen, and has ambition to equal if not excel some of his fellow-apprentices, will naturally look for and expect to receive encouragement from some source. He looks up to the older apprentice, to the journeyman, to the superintendent, or to his employer for advice, and in most instances receives a cold reply to his inquiries. The best boys are generally the timid ones; the forward boy, in many instances, not being treated as kindly as the boy who seems to lack self-esteem. There is always a "spark of human kindness" extended to those who seem most dependent on others. And in no place should this generous feeling be so liberally shown as in the machine-shop, where the names of the tools and the nature and perplexing variety of the work to be done would puzzle the mind of a timid boy. Therefore, those having control of either men or boys should use civil and polite language in giving directions, keeping in mind the fact that, should the head get impatient and ill-tempered, every member will be affected in like manner. A boy should receive every encouragement and advice until he has sufficient self-reliance to depend on his own ability to do a job unaided; every chance should be given him to learn all that is requisite to make him a thorough mechanic, as it is as much injury to the reputation of a shop to turn out an inferior workman (a chunker) as it it to turn out an inferior and defective engine or tool. The employer or foreman should not be always watching the apprentice in hopes of detecting him wasting either time or material; for if a boy has an idea in his head which he desires to perfect—whether it be in the shape of a pair of legs made into calipers, a trysquare, in the "truth" of which he has implicit reliance, an accenter punch, hammer or tool, or, maybe, a valuable shop hint that had escaped your sight—you can rely upon it he will find (not steal) both time and material to do the job to his liking. He is boss of that job, and you may depend upon it.

Thomas F. Hagerty, in the *American Machinist*, says, relative to the last year of his apprenticeship: "The practice at that time was to employ many apprentices and very few journeymen. One of the partners of the firm generally acted as foreman—the reverse of this is the practice of the present day. A task of so many pieces was set before each boy or man as a day's work; all work over that number was paid for by the piece. The tools in use at the time were of the most inferior kind, and each hand had to keep his own lathe and bench tools in order in his own time. Any tool which could be devised to aid in performing the task in less time was eagerly sought for. One part of the work occupied two hours' time every day, which with the proper tool, specially designed for the purpose, could have been done better and with more uniformity in five minutes. I conceived the idea of inventing a tool to do this job, but fearing to receive the usual brutal rebuff from the boss, I set to work to perform the task in my own time. I devoted my spare hours at night to the drawing, and half the dinner-hour every day to the pattern, until it was finished. I had castings made, and the parts finished and ready to put together and try on the first opportunity I could get. The boss came 'nosing around' the boys' bench drawers, and in mine he found the prospective device, which would have given him a monopoly of one branch of his business had not his own meanness prevented it. His discovery embraced a frame and a few small shafts and screws, two little gooved wheels, and a bifurcated lever and handle. I am charitable enough to believe that he supposed that it was some kind of a toy I was making at the expense of his time and material; but without waiting for an explanations, he began to curse and fret, and finally broke up my device with a hammer, and threw the parts into the scrap heap. I had no redress left me, as to attempt a remonstrance with him would have led to fisticuffs; therefore I had to grin and bear it. I need hardly say that when my apprenticeship time expired I left the shop, and that a rival shop received the benefit of that and many other inventions, which enabled them to manufacture and sell their goods more cheaply than before. Several patents were issued years afterwards to other parties for the application of the principles embodied in my device, for other purposes. This is one of many instances which I could relate where the first efforts of the apprentice to bring out and apply his individual talent was checked by ignorant and unkind rebuffs. Therefore, I say give the boy a chance."
—*Western Industrial Journal.*

Any one sending us 5 new subscribers to the "California Architect and Building News," we will give one copy each of "American Cottage Homes" and "Model Homes."

Practical Scientific Research.

There is a growing conviction among thinking men that money is well spent in promoting really practical scientific investigations. The number of obscure points which are daily brought to the attention of busy men is much greater than might be surmised by those not called upon to meet industrial and commercial questions. The busy engineer, mechanic, electrician, and chemist are sure to meet problems of great importance at almost every turn, and many are the regrets that they express that the pressure of necessary routine work renders it impossible for them to study, and perchance solve, some of the questions they are forced to ignore.

The more wide-awake business houses are beginning to see the benefit to be derived from a thorough study of processes for manufacture, from more carefully made machinery, from a more thorough utilization of mechanical and chemical forces previously wasted, and from the positive guaranty which a competent expert can give that the goods they manufacture and sell are of exactly the quality demanded.

But few business firms, however, are willing to go so far as to employ men and furnish facilities for the more elaborate and generally useful investigations; such work has usually been performed by college professors.

Notwithstanding the eminent ability of many of the men who have thus contributed to science, it must be admitted that their results are frequently more or less unsatisfactory. For this there may be several explanations: college professors are often overworked; they are often embarrassed for want of means to procure necessary books and apparatus; and, lastly, they do not, as a rule, mingle freely with the busy practical men to whom industrial and scientific questions are daily being presented. The consequence is that very many scientific professors are devoting themselees to what they term "pure research," and are carrying their theories far beyond the limits of usefulness and common sense. It seems to be true that we must look outside the colleges for a large share of the practical scientific work now waiting to be done.

Much can be accomplished if each well-trained worker will give a small portion of his own time, outside of business hours, to the investigation of some one question which he deems of real importance. Let the work be done without haste, thoroughly, conscientiously, and without regard to preconceived theories, let results be minutely recorded when obtained, and, finally, let all be carefully digested and printed in some wide-awake journal for which it is appropriate.

The various scientific and trade associations can do much good in the same direction, by setting apart moderate sums of money to be judiciovsly expended for the promotion of scientific and practical investigation of the various questions presented. Most societies have among their members men who are fully competent to conduct elaborate and useful experiments, and derive therefrom results of real value to all. It is a good sign when such work is encouraged by associations of practical men, and we are glad to note that many societies now have funds, the proceeds of which are employed for the encouragement of original research upon practical questions.—*The Sanitary Engineer.*

Edge Tools.

All cutting and piercing edge tools operate on the principle of the wedge. A brad-awl furnishes an example which all can readily understand. The cutting edge of the awl severs the fibers of wood as the instrument enters, and the particles are compressed into a smaller compass, in the same manner as when a piece of wood is separated by a wedge. A chisel is a wedge in one sense; and an ax, drawing-knife or jack-knife is also a wedge. When a keen-edged razor is made to clip a hair or remove a man's beard, it operates on the principle of the wedge. Every intelligent mechanic understands that when a wedge is dressed out smoothly, it may be driven in with much less force than if its surface were left jagged and rough. The same idea holds good with respect to edge tools. If the cutting edge be ground and whet to as fine an edge as may be practical with a fine gritted whetstone, and if the surface back of the cutting edge be ground smooth and true, and polished neatly, so that one can disern the color of his eyes by means of the polished surface, the tool will enter whatever is to be cut by the application of much less force than if the surfaces were left as rough as they usually are when the tool leaves the grindstone. All edge tools, such as axes, chisels, and planes, that are operated with a crushing instead of a drawing stroke, should be polished neatly clear to the cutting edge, to facilitate their entrance into the substance to be cut.

Damage to Lead Pipes by Rats.

In the cellar of a house in Berlin, a large number of rats had recently taken up their permanent abode. Notwithstanding traps and poison, the vermin could not be got rid of. The brickwork was carefully examined, and a good many holes were discovered, which probably served as nests for the rats or led to the outside soil. All the openings were filled with cement, and the walls of the cellar pointed. The floor, which had hitherto been loose, was laid with bricks and cement. The rats disappeared; but after a short time a wet spot was observed in the brickwork, near where the water supply pipe ascended. On examination, a number of dead rats were found in a space of the cutting made for the pipe, which had not been filled up when the pipe had been moved, and close by, the lead pipe had been gnawed right through. The above may be very easily explained. A family of rats had settled in the cutting; exit had been cut off by the closing up of all the holes; the rats, trying to get out, had attacked the lead pipe as being the softest material in their prison. They gnawed until they had made an opening, when they were drowned by the outflowing water.—*The Builder.*

Sawed veneers preserve the natural color and grain of the wood better than sliced.

Market Reports.

PAINTS.—The price of paint has been reduced owing to the competition of Eastern firms. The best white lead can now be had for 6¼ cents per pound.

Building Intelligence.

Although we present a full report, our list shows a falling off from those of the past few months. The elect on just concluded has so engrossed the minds of many of our citizens and capitalists that but little attention has been paid to building operations. The early advent of winter has had considerable to do with the partial stoppage of improvements, while the high prices of mason's labor and materials have materially affected the building of brick houses. The latter is a matter that will be regulated entirely by the demand. As far as we can learn, there is little probability of any large jobs being commenced this winter.

SAN FRANCISCO.

Pacific, nr Steiner. Two-story attic and basement frame.
O.—Lathrop.
A.—W. J. Smith.
C.—J. Robertson.
$7,500.

Steiner, x Pine and California. Two two-story frame.
O.—W. Frost.
A.—G. E. Voelkel.
C.—P. Laherty.
$7,000.

Bush, x Scott and Devisadero. Four two-story frame.
O. & B.—Geo. Edwards.
$10,000.

Market, nr Seventh. Two-story brick building.
O.—F. S. Wensinger.
A.—Swain & Cleaveland.
C.—McCann & Jeffars.
$17,000.

Twenty-first and Treat Ave. Two-story frame.
O.—G. Krebs.
A.—Kemitzer & Raun.
C.—G. R. Lang.
$9,500.

Folsom and Twenty-fourth. Two one-story frame and improvements.
O.—N. B. & N. R. R. Co.
Days' work.
About $9,000.

Jackson, x Sansome and Montgomery. Two-story brick building.
O.—Presidio R. R. Co.

In San Francisco, November 17th, 1882, after a lingering illness,

Mary A. H., wife of James E. Wolfe,

Aged sixty-eight years and nine months.

Since our November issue, and after a companionship of nearly forty-five years, the wife of the senior editor of this journal has passed to a realization of that which lies beyond the limits of human life. During the prolonged and severe illness of months preceeding her death, she suffered patiently, as one sustained by faith in a glorious immortality beyond the grave; and while loved ones mourn her loss, their sorrows are mellowed by the sweet reflection that their loss is, in truth, her eternal gain.

Retrospect of 1882.

The year of 1882 has been one of general prosperity, not only in San Francisco, but in all parts of California and the Pacific States and Territories; and the demand for skilled labor has at times far exceeded the supply of good mechanics, and at no time during the past twelve months has there been an excess of *competent* workmen in any of the branches connected with house building, and as a general thing contractors have been forced to employ second to tenth rate men at wages greater than the value of the services rendered. And when this is the case it may be regarded as a fact that "times are lively"; for the engagement of inferior workmen is the result of pressures and the absence of a sufficient number of the better class to fill the demand. This same state of facts exists in all other mechanical operations. The number of *first-class* workmen in San Francisco is sufficient only to meet the emergencies of moderate activities; so that, when brisk times set in, contractors are frequently bothered to find a full force of *good hands*, and as a consequence the more or less worthless class find employment.

The building improvements for the year have been confined mainly to family residences and tenement houses, among which two-story "*flats*" are numerous. The number of brick structures erected during the past twelve months has not been large nor costly, the most expensive being that owned by Wm. M. Lent, situated north-east corner Post and Dupont Streets, and costing about $100,000; James G. Fair's building, situated on Pine Street beween Montgomery and Sansome Streets, costing approximately $100,000; W. J. Somers' building, Market Street opposite Dupont Street, approximately $100,000; Schroth and Westerfield's building, north-west corner of Turk and Mason, costing about $50,000; T. H. Blythe's, Dupont and Geary, costing approximately $90,000. These constitute the principle brick constructions, with a limited number additional, costing $25,000 and less.

Master masons have at times been "driven to their wit's end" to secure competent help. And should there be an increased number of brick structures erected during 1883, it will be necessary to secure additional labor from abroad. The reason why this seeming scarcity of journeymen brick-layers exists, with but few brick edifices under way, is found in the fact that owners are becoming more and more convinced of the folly of inserting wood mud sills and foundations, which last but for a limited time, and the wisdom and economy of adopting brick. Hence a majority of the wooden constructions are now erected upon the more durable foundation; and as this view of matters becomes still more general, scarcely a frame building of any importance will be constructed without brick foundations. So that with a brisk season of entirely wooden buildings, the whole present force of brick layers in San Francisco will find constant work.

Additional to all this, there are the following factors, in part respectively accounting for the scarcity of brick masons' help. Fresno, Red Bluff, Willows, and Truckee have been nearly entirely destroyed by fire, and the rebuilding has been mainly of brick. The prosperous state of things generally has led to the erection of brick buildings in nearly every town and city in the State. The property abounding throughout Oregon and Washington Territory has induced the erection of very many brick edifices at Portland, Seattle, and other places, all of which have drawn upon San Francisco for brick layers. Beside this, the matter of erecting one or two fire protection brick walls, and the partition walls, and brick nogging of frame buildings in San Francisco in so many cases, have required millions of brick, and engaged the labor to lay them. As showing approximately the total of the year's improvements in San Francisco, we have compiled the following from the monthly issues of this journal, which may be relied upon as approximately correct. Owing to the difficulties in obtaining from architects and owners correct statements of costs, and the fact that we may have failed to obtain a full list of *all* the buildings commenced, and the extras, in very many cases reaching from five to twenty per cent. on the contract prices. Our monthly reports may be reasonably set down as averaging fully ten per cent. less than the actual sum of outlay.

The following table will show the number of frame and brick buildings, with the number of repairs and alterations that have been made during the year 1882:

	Frame Build'gs.		Brick Build'gs.		Repairs and Alterations.	
	No.	Cost.	No.	Cost.	No.	Cost.
January	6	$13,000	2	$35,000	4	$8,000
February	13	53,387	1	35,000	2	12,500
March	19	47,850	1	8,000	3	5,500
April	55	185,650	1	20,000	23	38,700
May	49	141,300	4	117,000	17	39,450
June	54	344,750	..	.....	27	46,000
July	66	250,750	5	189,000	34	160,900
August	68	329,865	2	10,500	19	48,750
September	68	219,900	3	154,000	35	85,324
October	89	313,435	3	137,600	24	60,100
November	33	198,300	4	58,000	22	22,351
December	20	55,500	1	25,000	8	12,600
Total	540	$2,153,087	27	$848,100	218	$540,225

Total number of building operations of all classes during 1880 397
Total cost of same $1,754,435

Total number of same 1881 533
" cost " " " $3,790,732

Total number of same 1882 785
" cost " " " $3,896,212

In the above estimate for 1882 we have allowed ten per cent. for value of buildings that may have been missed by our reporters, improvements too small to be mentioned each month, and for value of extra work on cost of contracts reported.

Although the number of buildings exceeds that of last year by 252, the *value* of them shows but a small advance over 1881. This is owing to the fact that in the latter year there were many large buildings erected, the aggregate cost of which was over a million dollars; while in 1882 but few large buildings were built, and none to approach in value as in 1881 the Phelan Building, Sugar Refinery, etc. All in all, the year just closing has been the most prosperous one that we have seen for ten years, and the indications at present are that the year 1883 will exceed the present one in value of building improvements.

The Past, Present, and Future of this Journal.

The present number closes its fourth volume, including the quaterly of 1879, and we extend to our patrons hearty thanks for the very liberal support received, hoping that each succeeding monthly issue may not only merit a continuance of present success, but gain for it such reputation for excellence as to insure a subscription list equaling any class journal published in the English language.

Its issuance as a monthly in 1880 was received with gratifying favor, yet but few entertained the thought that it would become a permanent publication. Our best friends doubted its permanency, while expressing kind words of encouragement with wishes that prosperity greater than our highest ambitions might be realized. Prophets and the sons of prophets predicted its early demise, and knowing ones fixed the limits of its existence within the bounds of six months; within which time we were to be laid in our editorial casket, and over our ashes were to be placed the tablet of failure. But we can afford to forgive, while we smile at those who wished us well but feared we would not succeed; and to those who would have rejoiced had we gone down under the numerous adverse and disadvantageous conditions and circumstances of almost continued personal or family affliction, and the death of two loved ones within the last past eighteen months, together with the difficulties and arduous labors required in

overcoming the many obstacles encountered in working up and utilizing facilities necessary to better success; we simply ask that they lay aside all unkindnesses in the future, and like true and good men lend a helping hand in making sure the foundations of this the first journal ever published within the Pacific States in the interest of architectural, mechanical, sanitary, and house-building sciences.

If all the facts of its history were related and made the basis upon which to repeat a similar enterprise, it is doubtful whether within the entire territory of the United States a man or set of men could be found who would be willing to undertake the venture. At its inception as a quarterly, Kearneyism was rampant, business of every class and character depressed and demoralized, thousands of workmen unemployed, poverty and distress almost universal, and the then outlook one of a discouraging character. And even after the gods of evil had withdrawn their inspirations, and the sand-lot conclaves began to wither and sink into merited oblivion, it required the genial sun of nearly two years' bettered state of things to reinstate and restore the era of prosperity with which California is now and has been blessed since the crushing out and destruction of the never-to-be-forgotton evil days or 1879. In addition to all this, no journal of its character had ever been attempted upon this coast, and the undertaking was looked upon as chimerical. The avenues of information were unopened, and the fields of knowledge in matters necessary to make the enterprise a success remained unexplored. Architects, owners, and mechanics had learned to live without a home journal devoted to their interests, depending upon such as might be sent from abroad—overlooking the fact that this coast in nearly all of its building requirements differs widely from those of other States and cities, with scarcely a corresponding feature in either styles, plans, materials, or methods of construction.

It is generously and generally conceded that this journal has, during its publication as a monthly, exercised a material influence for good in architectural and mechanical circles; and it is and will continue to be the purpose and aim of its managers to increase and enlarge its influence; and whatever can be will be done in that direction.

Our greater cause of complaint and regret is, that while it is commended and recommended by architects generally, enjoys the enviable position of being the recognized official organ of the profession upon this coast, receives the liberal patronage of so large a number of mechanics in this city and all parts of the United States, and there being so large a number of those well qualified to write up instructive articles for publication, yet but few employ their leisure and talents in that direction. While we cheerfully feed our patrons with the best we can prepare for them, at the same time it affords pleasure to be able to introduce a new dish of intellectual viands and furnish our readers with a change of diet. We hope that in the future there will be an improvement in this connection, and that our architettural brethren, mechanics—among whom there are hundreds well qualified to present new or discuss old theories and subjects—and our friends generally, will devote some of their leisure in writing up articles. There are many practical-minded parties who, feeling that they lack the educational qualifications, neglect to exercise their talent through fear of failure to clearly express their views. To such we say: Do the best you can; and so far as necessary we will repair and strengthen, whenever a word or line needs correction or improvement. We propose this for the purpose of encouraging the efforts of those who lack confidence, yet in mind and thought are rich in valuable suggestions; practical men who have gathered largely from the prolific fields of experience, from whence to the world has from time to time come many of its truest and most valuable lessons. Full of hope and bright in prospects for the future, we close the volume for 1882; asking that its defects, omissions, and errors may be forgotton, and that the volume for 1883 may excell in every department those of former years. We wish one and all of our kind readers prosperity, health, and every blessing, and hope that at the end of the coming year but few of their number shall have been called to pass to scenes beyond mortal life, and that those who are spared yet another year may at its end be the better from its enjoyment, and the better prepared to meet the inevitable, whenever the time shall come to each to lay aside the cares and toils of life to enter beyond the veil which to mortal mind enshrouds the future in solemn mystery.

San Francisco Chapter American Institute of Architects.

The regular monthly meeting of the Chapter was held in the rooms of the Art Association on Friday evening, December 1st. A goodly number were present. In the matter of attendance, this Chapter, we think, will compare favorably with any belonging to the Institute.

The members were called to order by the President, J. Wright, Esq. Reading of the minutes and preliminary work were proceeded with as usual.

Committee on "Articled Students" were granted further time. Mr. W. Ferris was elected a member as draughtsman. The report of Mr. Eisen, while acting as secretary was received, and ordered spread in full upon the minutes.

Under the head—"For the good of the Chapter"—a member referred to the fact that carpenters and contractors were in the habit of retaining the originals, or making tracings of the drawings intrusted to them for execution, and whenever found convenient, of palming off such tracings either as their own, or as just suitable for an owner's use, with the remark that by using such tracings, the value of an architect's services could be dispensed with. Houses of the value of more than $10,000 have been built by plans furnished the owner by contractors, at no cost whatever for the plans to the owner.

It is a custom with some mill prorpietors to copy parts of details intrusted to them for execution, and to profit by their use in other connections than those for which the details were made—thus virtually defrauding the originator of benefits which should accrue alone to him. The compliment to the architect producing something so neat and beautiful as to be selected and placed on exhibition in planing mills for the selection and use of others, without cost for the design, is a specie of compensation not calculated to meet office rent and expenses, nor supply daily requirements.

"Nipping" things of even far less cost and value in other connection is punishable under the laws regulating community life; but unfortunately there is no law that shields and protects the labor and production of architects from being "nipped" by any one who may have access to them.

The introduction of this subject caused a lively interest to be taken by all the members present, and various remedies were proposed.

One member gave as his views that the proper way to stop the evil was to require full fees from all contractors for plans, specifications, and details when ordered by them. Also all contractors to be required to return all drawings and specifications to the architect.

Another member contended that it was impossible to prevent contractors copying plans, details, etc. He made it an invariable rule that before giving the certificate of the last payment, every drawing, memorandum, etc., should be returned to the architect. The only way possible to shut off the pilfering of designs was by educating the people to perceive the difference between the work of the professional architect and of his imitator. One of the grand principles for which this Chapter was founded is the education of the members to a higher and nobler standard in the practice of architecture. From the nature of his profession the architect should be a thorough mechanic; a popular error being that the architect is merely an educated carpenter. Our mission as a chapter is to show the difference between the architects—educated mechanic though he be—and a contractor's plans. It will be difficult for the Chapter to remedy the evil of contractors' copying plans, so long as the latter conceives it not to be dishonorable to filch the labor and skill of architects, without right and proper compensation.

The president made a few well-timed remarks, arguing that everything possible should be done by the Chapter to correct all irregularities of practice on the part of all parties concerned in general building operations, and to discourage the practice of plan and detail copying by either builders or mill-men. Correct and practical plans and details are not the work of a moment, but require study, care, time, and labor in their production; and it cannot be claimed as just or honest on the part of those who wrongfully appropriate such productions to their own uses and purposes without fair and just remuneration. The necessities of the case are a higher moral sentiment, favoring the rights of each and all and discouraging irregularities in every form. Architects are entitled to the enjoyment of all the profits and advantages arising from the exercise of their professional skill and labor; and it is but an act of common fairness and justice that contractors, mill-men, and owners should concede this equitable proposition and govern themselves accordingly.

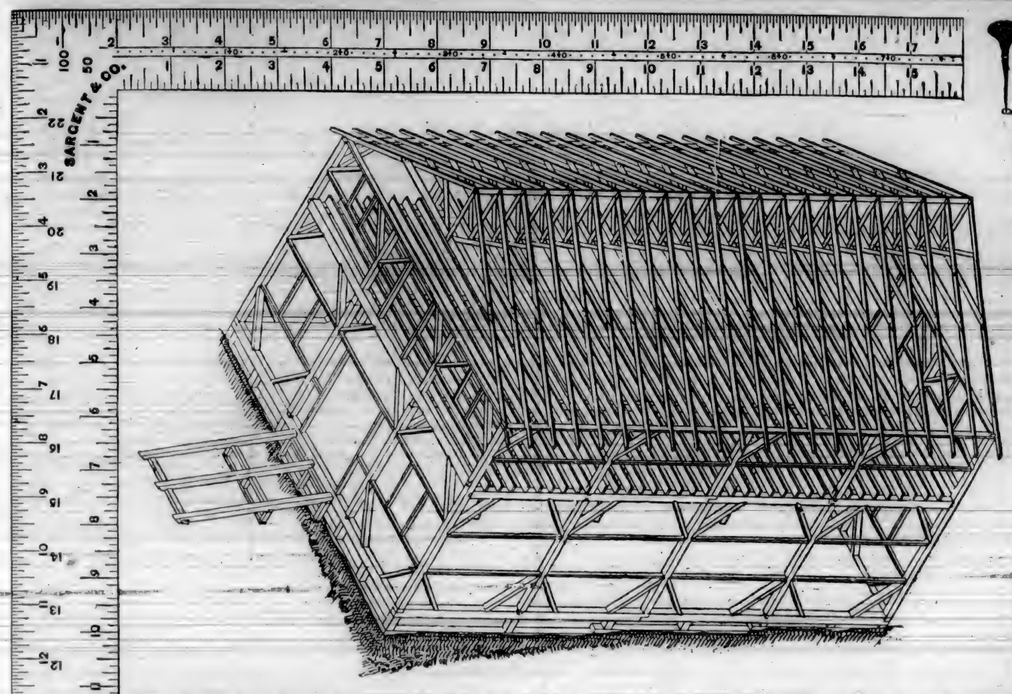
In harmony with the views expressed, a committee of three were appointed to take into consideration the subject-matter, and report at the next regular meeting.

The subject of a national style of American Architecture was introduced by Mr. Macy. It was argued that America, as the offspring of England, continued to a large extent to ape the architecture of the barbaric ages. Not a sacred edifice was erected where the worshipers did not assemble under pagan lines of architecture: Even upon our business streets sea-side cottages are being erected. The æsthetic craze is upon us, and until its reign is over, Americans cannot lay claim to founding a style peculiarly their own.

The secretary was instructed to notify the members of the Chapter residing outside of this city of the proceedings of this Chapter, and to request them at their earliest convenience to forward papers to be read at the regular meetings.

The Good Work Goes On.

We gladly welcome to our subscription list the large ingathering of new subscribers, and the renewal of old subscriptions. The conclusion is rapidly gaining ground that the best interest of all parties engaged in the erection of buildings, whether as architects, builders, workmen, or owners, are best and substantially subserved by perusing the monthly issue, of this journal. Let the good work go on, and soon we will produce an architectural publication unexcelled by any of its kind published within the United States. In both heart and hand, we are prepared for the better and greater work, and are eager for the day to arrive when we shall feel justified in laying aside a profitable professional business to enter upon exclusively editorial carear.



The above cut was intended to accompany the engraving given in our last number; but for the reasons then given its presentation was delayed. We show the frame-work of a substantially built barn. In order to carry out the principles laid down in our October number, we have placed our building on uneven ground.

The size of the mud sills will depend greatly on the character of the ground. Should the latter be soft and yielding, 4x16 inches, sound red wood, free from sap, would be the proper size timbers, in absence of brick or stone foundations. This size can be varied if the ground is firm. On a stiff, cement soil, even 2 inches would be thick enough for the sill. Be sure and have every part of your sill rest firmly on the ground. In order that it may do so, put your sill in its place, and with a piece of timber held perpendicular, strike several blows on the top of the sill; turn the latter over and remove the dirt from the *smooth spots*, placing it in the depressions. A little practice will enable any one to get the sill right on the second or third trial. *Be sure your sill is level across the grain.*

We will commence from the front corner and place our sills along the side of the barn. Lay the first piece as shown, level both ways. Let the second piece of sill lap over the first piece, and the third piece over the second. Secure the ends together by means of spikes. Place the sills all around in a similar manner.

Foundation being now ready, the main sill should next be placed in position. It should not be less than 8x10. Generally the longer lengths are preferable for sills on account of a less number of splices being required. Where the sill is near the ground it is the usual custom simply to halve the joints together. When this is done, they should be well nailed together. Too much care cannot be given in having the main sills level across the grain.

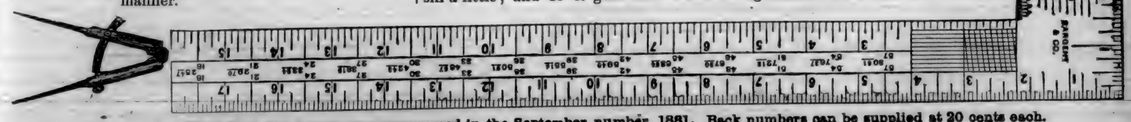
Right here we will call attention to a simple fact that has been the cause of more hump-backed, crooked barns and buildings than any other thing that we can mention. Great care, perhaps, has been exercised in having the foundations perfect; the sill picked out on account of its regularity and placed properly in position; posts placed here and there to keep the sill level, etc., etc. And here is where the fault comes in. The sill is up, and "Here, John and Tom, you finish the underpinning while the rest of us rush the joist on"; and so the "rest of them" will pile up a great weight of lumber on the sills, while John and Tom are cutting in the underpinning. John happens to be where the weight of the joist is the heaviest, and does not allow for the sag in the sill caused by the weight above; and so cuts his underpining in *snug*. Tom happens to be in a place where no weight has been placed, and he cuts *his* posts in *snug*, and perhaps raises the sill a little; and so it goes all around the building. You can rest assured that the top plate will have just as many little depressions as the sill must needs have from following the course laid down.

And again, in following the usual way of cutting studding, one stud is very apt to be an eighth of an inch longer or shorter than its neighbor; and if the shorter studs should happen to be placed in the little depressions mentioned above, the top plate will be! either decidedly out of level, or else there will have to be a *Dutchman* between the top of stud and the plate. Long studding, especially, should be cut in a miter-box, one set of men doing the gauging and sawing, and another taking out the gains with a chisel.

The correct way to do is to cut in all the underpinning, bracing, etc., before any weight whatever is placed on the sills. Then sight along the top of the sills, and if all is right, then go ahead.

In the cut as shown we have not represented as many posts in the underpinning as there should be, as we did not want to confuse the reader by too many lines. On the side, one post between those shown is amply sufficient.

Although we show a run-way from the front door, it is not calculated that teams will *go in* thereby. They can go around and the barn so arranged that a clear drive through the building can be made, so that hay and other materials can be placed in any part of the barn without being handled more than is necessary.



This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

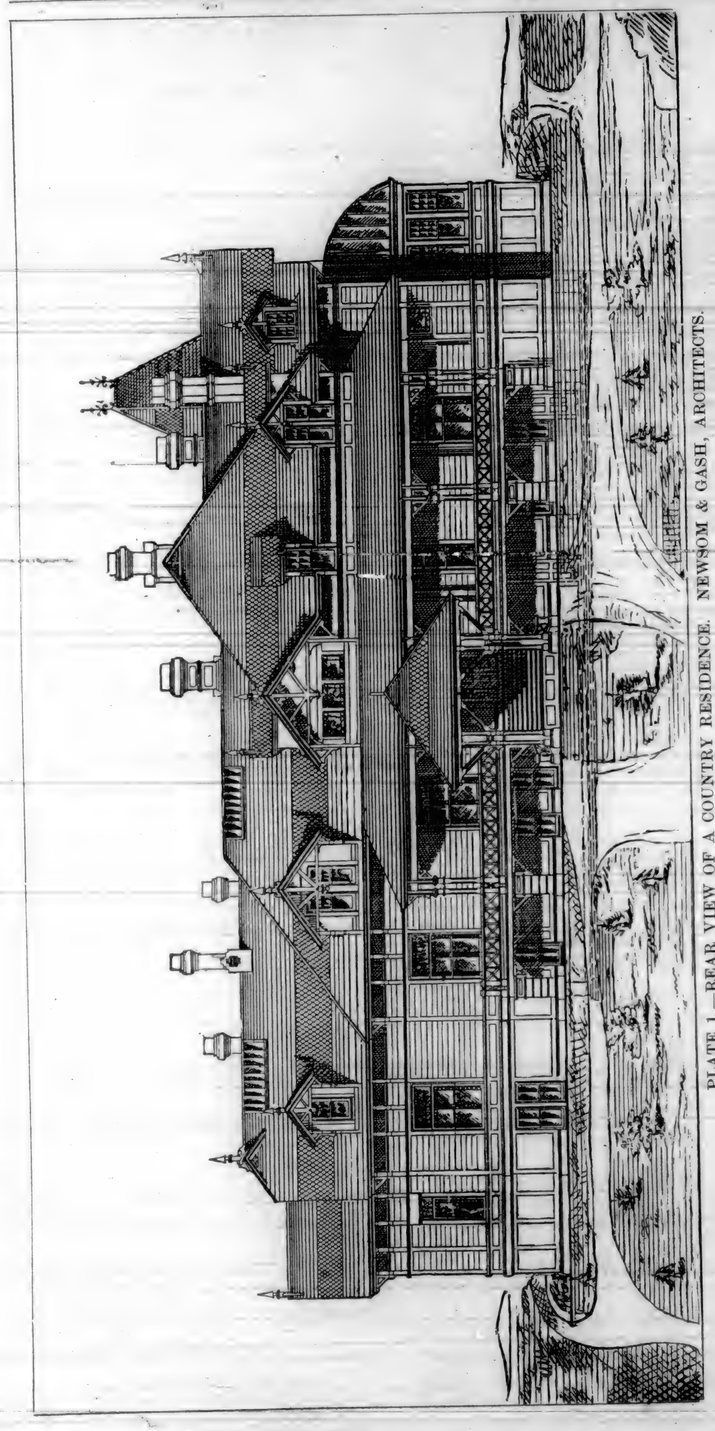


PLATE 1.—REAR VIEW OF A COUNTRY RESIDENCE. NEWSOM & GASH, ARCHITECTS.

ERRATA.

Under the cut on page 171 the words "Rear View" should be "Front View."

Our Illustrations.

Plates 1, 2 and 3 are the front and rear views with plan, of a commodious suburban residence. It can be built for $20,000. This figure may be changed either way according to the style of finishes used. Newsom & Gash are the architects.

Plates 3, 4 and 5 are the plans and elevation of a very convenient country home. It can be built for about $3,500. The arrangement of the rooms is all that can be desired in such a house.

Next year we will show our readers a decided improvement in regard to our cuts. We have made arrangements by which the drawings sent to us for reproduction will be given in a style not inferior to any journal published. We will also give a full description of each illustration, and the figures for which the buildings can be erected in California at the time of each issue. The latter fact is important to bear in mind, as the country home published in this issue would have had a smaller amount placed in its value had it been given in our issue of the same date last year.

Royal Institute of British Architects.

Through the kindness of its secretary we have been furnished full reports of the proceedings of the ROYAL INSTITUTE OF BRITISH ARCHITECTS, which we shall notice at length in the January number of this journal. A cursory review of its pages reveals a large amount of valuable matter, and demonstrates the fact that the architects of the mother country are alive to their truest interests as men, and to the interests of the profession to which their time, energies, and talents are devoted.

In this connection we again call upon our friends—architects, mechanics, and owners alike—to rally to the support of this journal, as by its greater financial success its management will be able to reach beyond all present attainments, and make it what this coast really needs, a supremely representative journal. Its circulation has heretofore reached to nearly every State in the Union, and to many cities and places beyond the limits of American territory; and its rapid augmentation of subscription patronage during the current year points to the time as near at hand when its circulation will be unsurpassed by any journal of its character, and we hope that none whose interests are represented in its columns will permit any opportunity to pass, to aid us in the consummation of the grand results in contemplation. We have demonstrated the sincerity of promises heretofore made by the improvements incorporated during the past twelve months; yet what has been done in comparison with that intended is but as the dews of night as compared with copious showers.

A Neat Answer.

"What is the use," contemptuously said a poor woman to a lady candidate of an important school board, "of teaching our girls drawing when they are only going to be servant-maids?" "Well," replied the lady candidate, "the great objection to servant-maids of the present day is, that through rough handling they break valuable glass and china put into their hands. They lack the delicate touch necessary for the right handling of them, and there is nothing so calculated to cultivate this delicate handling as the art of drawing, and hence it qualifies them for whatever may be their position in life."

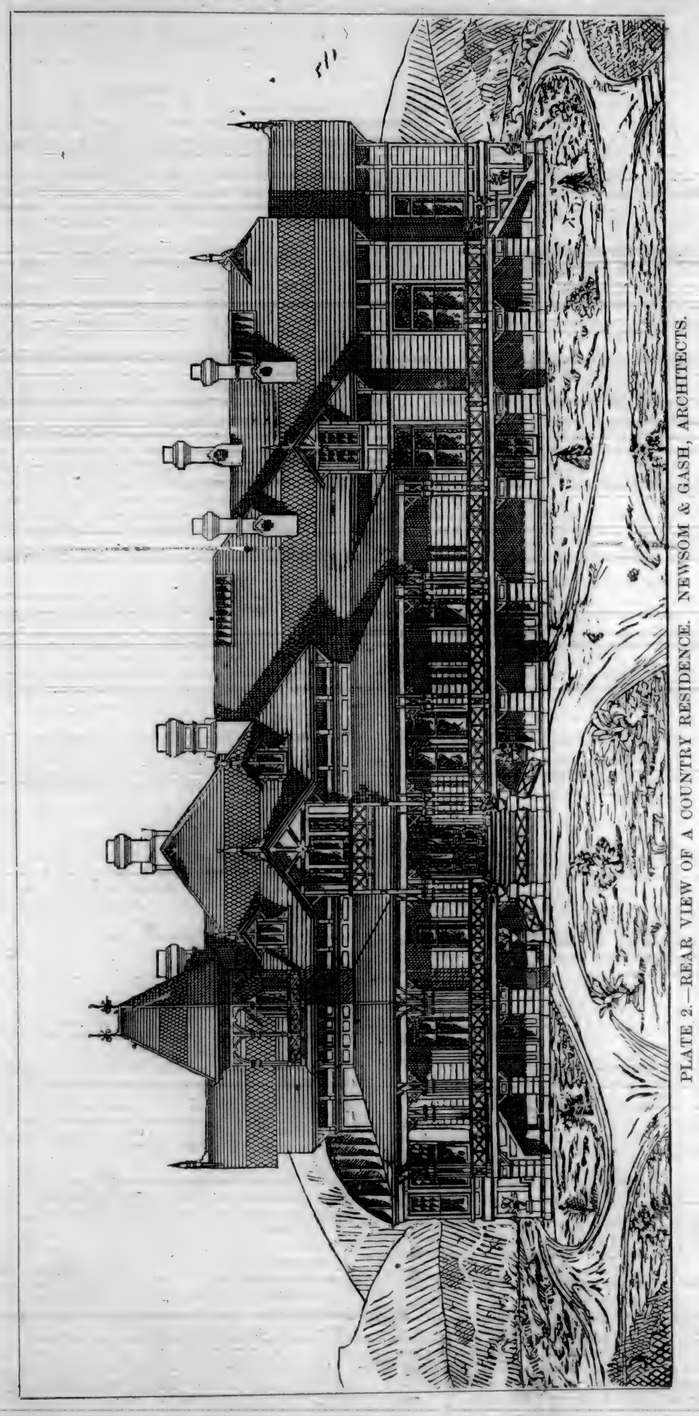

PLATE 2.—REAR VIEW OF A COUNTRY RESIDENCE. NEWSOM & GASH, ARCHITECTS.

EXTRA INDUCEMENTS

TO

SUBSCRIBERS FOR 1883,

TO THE

California Architect and Building News.

We will send either of the following journals for one year in connection with the CALIFORNIA ARCHITECT for the amount opposite their names:

	Price of paper alone for one year.	Price of paper and CAL. ARCH. and B.N.
American Architect (weekly Ed.)	$6.00	$7.00
" " (monthly Ed.)	2.00	3.50
Carpentry and Building	1.00	2.50
Builder and Wood Worker	1.00	2.50
American Artisan	1.00	2.50
Brick, Tile and Metal Review	.50	2.25
Carpenters' Journal	.50	2.25
Building	1.00	2.50
North-Western Lumberman	4.00	5.00
Scientific American	3.20	4.50
" " Supplement	5.00	6.00
Scientific American and Sup	7.00	8.00
Leffel's Mechanical News	1.00	2.50

Select any one of the following list of books, forward us the amount, and we will send you the book, together with the CALIFORNIA ARCHITECT AND BUILDING NEWS for one year:

	Price of Book alone.	With CAL. ARCH. and B. N.
Steel Square Problems	$ 0.50	$2.15
Steel Square and its Uses	.75	2.25
Builders' Price Book and Estimators' Guide	2.00	3.50
Palliser's Useful Details	2.00	3.25
American Cottage Homes	3.00	4.25
Modern Architectural Designs and Details	10.00	11.00
Detail Cottage and Constructive Architecture	10.00	11.00
Village and Country Homes	5.00	6.00
Science of Carpentry	5.00	5.50
Plasterers' Manual	.75	2.25
Artistic Homes	3.50	5.00

Francke's Monuments and Tombstones	9.00	10.00
Wither's Church Architecture	10.00	11.00
Sewer Gas and its Dangers	1.25	2.75
Workshop Companion	.35	2.10
Reed's Houses for Everybody	1.50	3.00

Any one sending us the names of three new subscribers, with $6, will receive a copy of the CALIFORNIA ARCHITECT AND BUILDING NEWS free.

Any one sending us the names of ten new subscribers, with $20, will receive a copy of the CALIFORNIA ARCHITECT AND BUILDING NEWS free, and $5 worth of books selected from the above list.

A club of twenty-five new subscribers entitles the sender to a copy of the CALIFORNIA ARCHITECT AND BUILDING NEWS, and $20 worth of books selected from the above list.

The Use and Abuse of Screws in Wood-work.

Archimedes is credited with the invention of the screw, but whether the famous geometrician's labors extended much further than the enunciation of the scientific principles and the mechanical power of the screw, it is difficult to say. If he made a screw, he certainly must have tried its effect, and was probably well pleased with its performance, for in the whole range of mechanical appliances in the constructive arts there is not a more useful article than the screw. Archimedes is further reported to have said, "Give me a prop, a position, and a lever strong enough, and I will move the world," and, no doubt, if these conditions could be granted to him, he, as well as others after him, could lift the earth, or aught upon the earth, by a combination of the tremendous lifting and driving powers exercised by a series of screws, apart from the lever. Screws are various, and of various sizes, forms, and materials, but the same principal runs through them all, whether they be manufactured for use in metal or wood-work, or for expecting a lifting, driving, or pressing power separately. Our object here is not to treat of screw-cutting, but rather screw-driving in wood-work, and to throw out some useful hints to the building constituency, and particularly workmen. The use and abuse of screws is a matter of importance to architects, builders, and their clients, for it is according to the way screws may be applied in several building and kindred operations that good or bad workmanship will be evidenced.

Screws are more extensively used than formerly in putting together various kinds of wood framing, and even in cabinet and chair work screws are pressed into service in places where their use would not have been tolerated by manufacturers in the earlier portion of the present century. Although their existence is generally concealed in furniture and fancy work, they are often present, nevertheless, and too often they are used as a substitute for dowels, dovetails, and tenons in the manufacture of cheap work. It is an instructive and remarkable fact that our building workmen of a century or two back, in many operations in carpentry and joinery, discarded, as far as was possible, the use of nails or screws, depending more on carefully jointed work, put together by means of mortise, tenon, dovetail, hard-wood dowel, or oaken pin. Their work might have taken a longer time to execute than that done by our present race of joiners and wood-workers, but it was infinitely more lasting, and kept together so long as the timber or wood continued sound. The nearly universal remedy now for every broken article on the part of the jobbing joiner and cabinet-maker is to repair it with the aid of a nail or a screw. Glue is even often dispensed with, or used where it will exercise little sustaining power, and colored putty is not only made to cover the heads of sunken nails and screws on the face of a piece of work, but used also to hide bad joints and workmanship. Some years ago the writer examined an old oaken staircase and hand-rail in a college, which work was executed more than two centuries since, and in the construction of which not a nail nor a screw was used. From time to time, over long years, some slight repairs were made, but the workmen during their operations were never able to discover that a nail had been used in the original construction. There were mortises and tenons, grooves and tonguing, wooden pins or dowel work, but no iron fastening of any kind. The writer also examined more than one old roof in which the use of iron spikes, nails, and other iron fastenings was dispensed with, and the joining of the timber was effected without their aid. In the hinging of doors and other framework it is necessary to use screws, but, unfortunately, many workmen, if not watched or cautioned, will not do the screwing properly or in a workmanlike manner. In deal, pine, and other soft woods a brad-awl is sufficient to make an opening for the screw, which opening, of course, should be less than the thickness of the body, and short of the length of the screws used. It will be found, however, that most workmen, not content with tapping the screw a fourth of an inch or so to give it a hold before applying the screw-driver, will actually drive the screw into the wood two-thirds of its length with the hammer. This the workmen will do to save themselves trouble. If there be two hinges upon a door, and if each hinge has eight screw-holes—four in each plate—the chances are that the workmen will drive half of the screws nearly home in the door-stile and frame with his hammer rather than take the trouble of driving them gradually home with the screw-driver. Hence, if the door be a massive or heavy one, the weight of it will tend to the hinges loosening, and after a time will follow a train of other ills—the "dragging" and "rubbing" of doors, and their makeshift cure is what is known as "easing" them. If remonstrated with for driving a screw nearly home with the hammer, the workman may probably say (as some workmen certainly think) that a few turns of the screw in the wood are sufficient. This is an erroneous and michievous idea. A screw that is nearly driven its whole length with a hammer cannot make a regular and corresponding thread or spiral in the wood, and therefore its binding and maintaining power in keeping the hinge in its place is all but gone. Workmen should be made to drive every screw home gradually with the screw-driver, and not only an odd one. In hardwood operations as well as in soft woods, particularly in hinge work, screws should be properly driven, and the aperture or opening made for the passage of the screws should be much less than the thickness of the screw to be driven. The screw will bite a sufficient passage for itself. In hard wood, however, it is necessary to give a little more freedom of entry to the screw than in soft wood, and a gimlet is needed for making the suitable opening instead of the brad-awl.

A difficulty is often experienced by persons who wish to withdraw a screw, by finding that though it will turn round under the application of the screw-driver, yet it will not unscrew out. In this case a well-grounded suspicion may be entertained that the screw in question was driven, or nearly driven, home originally by the hammer, instead of gradually by the screw-driver, and that no regular thread corresponding with the screw exists in the wood. Under such circumstances it becomes necessary often to wrench off the hinge or hinges by force, at the risk of their breaking, and this often happens. When hinges have lain undisturbed for years on old doors or other framings, perhaps for a quarter of a century or double that time, it becomes difficult to extract the screws, although they may have been originally properly driven. This arises from the screws rusting in the wood and sometimes from other causes. Workmen themselves often fail to withdraw a screw, and are forced to break the hinge to enable them to get under the head of the screw, and wrench it out. They often split, and break too, fancy and delicate woodwork articles in their efforts to take off hinges, locks, mountings, and other finishings, despite that simple methods exist for extracting screws that have rusted in the wood. One of the most simple and readiest methods for loosening a rusted screw is to apply heat to the head of the screw. A small bar or rod of iron, flat at the end, if reddened in the fire and applied for a couple or three minutes to the head of the rusted screw will, as soon as it heats the screw, render its withdrawal as easy by the screw-driver as if it was only a recently inserted screw. As there is a kitchen poker in every house, that instrument, if heated at its extremity, and applied for a few minutes to the head of the screw or screws, will do the required work of loosening, and an ordinary screw-driver will do the rest without causing the least damage, trouble, or vexation of spirit. In all work above the common kind, where it is necessary to use screws, and particularly in hinge-work and mountings, fancy fastenings and appliances affixed to joinery or furniture work, we would advise the oiling of screws or the dipping their points in grease before driving them. This will render them more easy to drive and also to withdraw, and it will undoubtedly retard for a longer time the action of rusting.

As matters obtain now in carpentry, joinery, furniture, and other wood workmanship, with regard to screws, although they cannot be dispensed with, yet it would be advisable in sundry classes of wood-work to minimize their use, and in other cases to do without them altogether. They can seldom be used with advantage to the displacement of mortise and tenon or good dovetail or dowel work. The growing practice of putting together wood with screws bespeaks a decadence of skilled labor, and of nails and screws there are far too many pressed into service in workshops and dwellings. While admitting the usefulness of the screw in various ways, we have here endeavored briefly to show its abuse in wood-work, and at the same time to afford some hints for better methods of procedure in building and kindred workmanship. —*Ex.*

To Young Achitects.

A worthy literary friend, having a taste in early life for the violin, was told by his master that to succeed he must serve an apprenticeship of seven years, practicing ten hours a day, and then he might expect to know a little. Let young architects likewise realize what is before them, and cultivate the power of executing artistic sketching and design in all their multifarious branches, Gothic and Classic, Mediæval and Ancient, and practice the modes of excuting such work in pencil and pen, color and crayon, and likewise seek acquaintance with the most natural as well as approved methods of construction ; and acquire a facility to calculate the various strains, breaking, crushing, and safe weights of all the known materials under their varying circumstances; understand the many kinds of timber and stone, metals, and materials of all descriptions; acquire familiarity with all the various artificers' work, bricklayer and mason, carpenter and ironfounder, slater and plasterer, plumber and painter, glazier and decorator, efficiency to any one of which it takes the artificer himself a lifetime to acquire; and learn the technicalities of the measuring and pricing in these various trades, of which the artificer himself is in many cases uninformed; study sanitation, ventilation, and the jurisprudence of building, Building Acts, Fire Prevention Acts, Sanitary Acts, and all the Local Government Board requirements, the light and air, the party-wall and compensation cases; start with the level and theodolite, and study the technicalities of land surveying; and by the time they have further learned what are the requisites for good planning, in all the known requirments of modern dwellings, ecclesiastical, manufacturing, and public buildings, they will, at any rate, be ready for starting business on their own account,

Knowledge is power, and the duly qualified architect should not be among the least powerful in the community.

Advice to apprentices : Begin at the bottom of your business and work up. N. B. Well-diggers excepted.

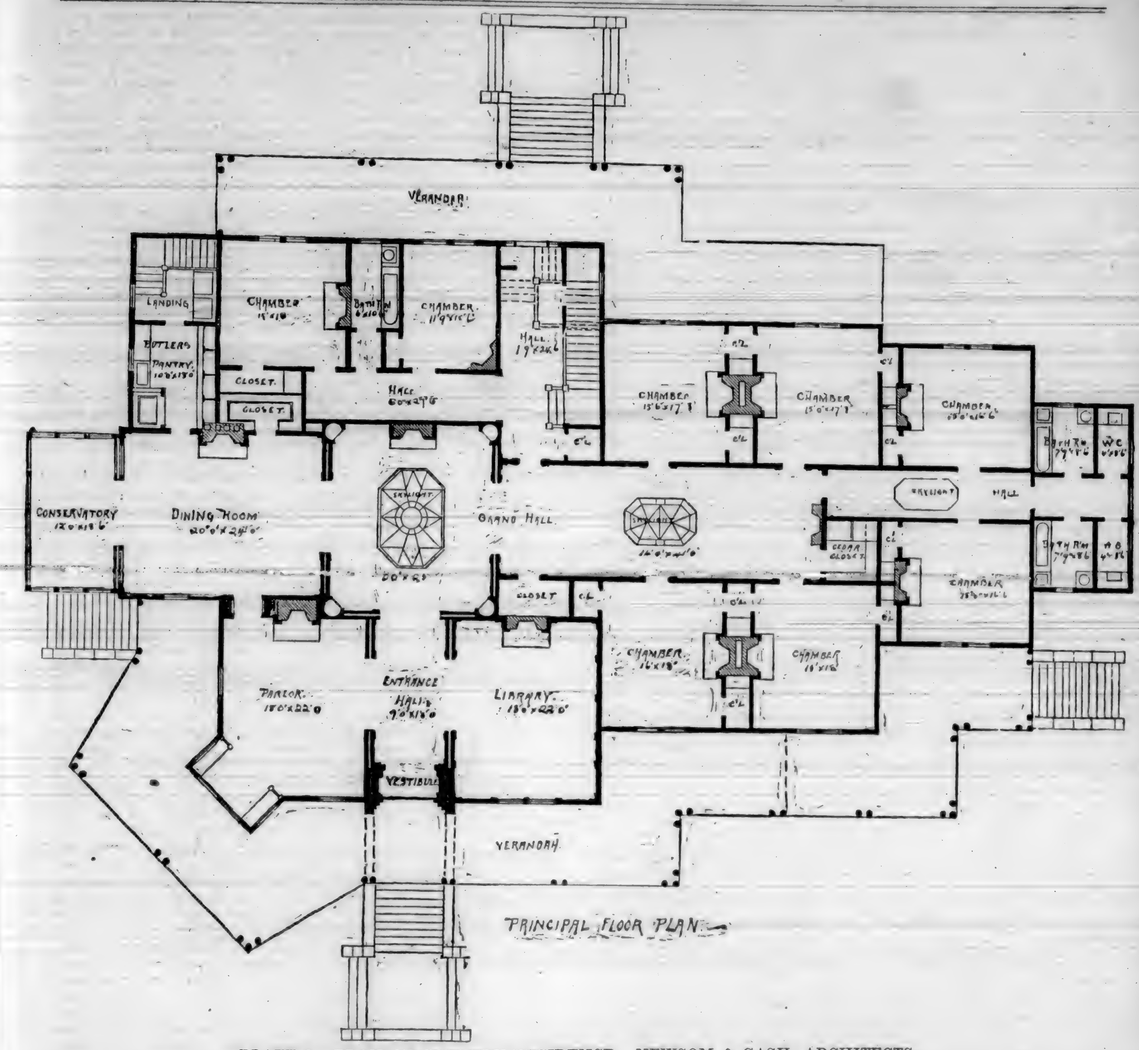

PLATE 3.—PLAN OF COUNTRY RESIDENCE. NEWSOM & GASH, ARCHITECTS.

How to Clean Pens.

A writer in a German paper states that it is a custom in offices in that country to have a sliced potato on the desk in commercial houses. He does not state whether the esculent should be raw or not, but as it is not for the purpose of making kartoffel-salat, it is probably raw. It is used to clean steel pens, and generally acts as a pen-wiper. It removes all ink-crust, and gives a peculiarly smooth flow to the ink. He also states that the Hamburg clerks pass new pens two or three times through a gas flame, and then the ink will flow freely.

The pleasant odor of cedar seems inseparable from the wood. Pieces of white cedar stumps which had long been under water at the entrance of New York harbor had the odor of newly grown wood.

Scandinavian Floors.

The chamber floors found in the northern parts of Sweden and Norway are laid with boards cut from the tree without being sawed parallel, and consequently retaining all the taper of the tree. The edges of the boards are tongued and grooved, and the joiners who cut the tongues and grooves work in pairs, one pulling and the other propelling the tool that does the work. In consequence of the boards tapering, they are laid with a broad and narrow end, meeting alternately, and thus a dovetail is effected along the whole length of the boards, and a very curious appearance is the result.—*Timber Trades Journal.*

We will send the "California Architect and Building News" for 1883, and one copy of "American Cottage Homes," for $4.25.

IVES' PATENT DOOR BOLTS.

Sold by all Hardware Dealers.

(APPLIED WHOLLY BY BORING.)

HOBART B. IVES, NEW HAVEN, CONN.

Sole Manufacturer and Patentee.

As we predicted a year ago, the introduction of the above celebrated bolts is driving all the poorer quality entirely out of market; and wherever one goes on the Pacific Coast, he will find the Ives patent to be *the* popular safeguard against the intrusion of burglars. They are for sale by all of our principal hardware dealers.

☞ $3.50. ☜

We will send the "California Architect and Building News" for 1883, and one copy of "Palliser's Useful Details," for $3.50.

Ambiguous Specifications.

Ambiguous specifications are due either to carelessness or want of practical knowledge. In either case they are to be condemned. In the former case they are especially to be condemned. There may be an excuse for a want of practical knowledge; there is none for carelessness. Orderly arrangement and adequate description are naturally to be expected. The specification is as needful as the drawings, and if it be incomplete the architect's work is imperfect, and so in all probability will be the work of the builder. The incompleteness of a specification is a sure sign of an unstudied building. A well-prepared specification proves thought, and makes the architect master of his design. But if he do not himself understand it, he cannot expect others to understand it. They may, guess at his meaning; but guesses, when money, appearance, and durability are at stake, are not advisable. Obscure intentions cannot be embodied in lucid instructions. Nor can obscure thoughts. Want of knowledge may sometimes be concealed in generalities; but in specifications, when concealed, it is often revealed. The studious avoidance of practical details tells its tale; and when generalities soar, the result is not invariably happy.

Stereotyped specifications are likewise the cause of confusion. Stereotyped specifications are mostly ambiguous specifications. Specifications to be serviceable should be adapted to requirements; and, as the requirements of no two jobs are alike in every respect, the stereotyped specification will only apply in part. Cutting out and inserting in no way improve them. Every job requires its separate specification. The outline, or general arrangement, of specifications may be—in fact, should be,—similar, so far as the test of practice stamps it with approval. But all the nice explanations of details required for each job should be strictly original, and introduced at the right places, that the estimator and the foreman may readily comprehend the architect's wish or intention.

Ambiguous specification are downright evils. They offer loopholes for evasions and furnish grounds for exactions. To them is doubtless attributable the great difference frequently seen in tendering. As read by some, certain works are suggested; as read by others these works are overlooked. The shrewd, careful reader notes that certain works are necessary, but he does not provide for them, knowing to a certainty that others will not. Were he to provide for them the job would be lost, and if he lost the job he would for certain nothing gain; whereas, by taking it in its incompleteness he has at least the possibility of gain. The bareness of the possibility is a strong temptation to wrong. Thus it is that swindling occasionally begins with putting in the foundations and ends with scrubbing the floors. Where lies the fault? In the architect's office or the builder's? The truthful answer is—in both.

Keenness of competition means lowness of price; lowness of price entails cutting of work; cutting of work is another name for theft; and theft by rights should send man to prison. When a builder takes work in the full consciousness of the specification's incompleteness, he burdens himself with the responsibility of the due performance of all things needful. However loose or vague a specification may be, it is pretty well sure to contain some such stipulations as these: "The contractor shall provide for all works, and do all the several matters and things required for the thorough performance of the contract"; and "the contractor shall hand over the building clean and perfect throughout on completion." In submitting his tender, he announces his determination to execute the work in accordance with the specification, and since the specification requires thoroughness, honor asserts that thoroughness should be had. This, however, is no excuse for the architect. The work should be clearly specified in his office, then all would tender alike; fair prices should be obtained, and the evils of sharp practice should be banished. There will be a certain amount of sharp practice under any circumstances so long as men are in haste to get rich, but the fault and the blame would then rest with the evil-door. If when a specification is clear, or tolerably clear, the shifty contrived to disregard its plainness and wrest its obvious meaning, much worse must the case be with a specification that even the honest can barely understand. This proves the need of clearness. If the work of the ambiguous specification is honorably performed, the builder has to pay the penalty of the architect's negligence.

Hammers.

To most persons a hammer is simply a hammer, but every mechanic knows that there is a great variety of hammers, from the tiny lump of steel with which the watch-maker taps the mandril of a balance-wheel to the huge trip-hammer under which tons of hot iron are molded into shape. The hammer, in fact, plays an important part in the mechanic arts, each one presenting its peculiar form, size, weight, and material. In some trades there is great skill and dexterity required in the use of the hammer. Any one who has seen the operation of riveting a boiler has admired the sleight of hand with which the strikers round up the head of a rivet in less time than it takes to write about it. The blows follow one another with wonderful accuracy and rapidity, and when the rivet-head is finished it looks as smooth and regular as if it had been cast in a burnished mold. Take even the process of driving an ordinary nail, and it is remarkable what a difference there is in the method of a novice and that of a carpenter. The one hits one side, often bends or breaks the nail, or bruises the finger that holds it. The carpenter hits with precision, and drives the nail home with well-directed blows. The deft hammering of coppersmiths is proverbial, pounding metal into any required shape. The copper plates that are used by engravers are hammered hard in long strips by the use of large steel hammers with faces as smooth as that of a mirror. The most accurate hitting is required in this process, because the hammer-face is flat, and must be held perrectly level to avoid cutting deep gashes in the plates. When it is necessary to make bevels on these plates, a skilled workman will make a bevel with a hammer in a few minutes that would require hours if made by filing and polishing. Silversmiths learn to be very expert in the use of the hammer. Spectacle-makers can take the temples of a pair of ladies' spectacles and temper them by dexterous planishing between hammer and anvil. A blacksmith always has an assortment of hammers with which to shape the ductile iron. File-cutters are required to use hammers with great judgment. Each tooth in a hand-made file is made by the burr raised by tapping a sharp chisel held to the soft file. After each blow the chisel is set up against the burr of the last stroke and another burr is raised, and so on until the file is finished. The force of the blow measures the size of the burr raised, so that the regularity of the file depends upon the evenness of the hammer-stroke. Many files are made by transferring processes by machinery, but the hand-made files command the highest price, while with many peculiar forms of files the hand-work is indispensable, and the regularity of hammer-work a necessity. One of the most difficult jobs to be done with a hammer is to straighten large flat plates of metal. An expert workman will here do, with a few strokes of the hammer well directed, work that a non-expert cannot do at all. Indeed, without great skill, the attempt to straighten plates with a hammer generally results in making the crookedness worse. The gold-beater's hammer is wielded day by day by the trained hand, although an hour of it would fatigue the novice. The calker has a peculiar long hammer. The ax and the adze are but sharpened hammers. Machinists use great copper hammers for work where they wish to strike blows without marring the object struck. Among the queerest hammers in use is a magnetic hammer. There was once a Yankee peddler who used one of these to great advantage. He was peddling a fancy soap. He would go into a store, pull out his advertising card, "Buy my unequaled soap," and before the astonished store-keeper could remonstrate he would tack up one of his cards on a rafter or wall where it could not be taken down without a step-ladder. The way he did it was to hold up his card to the required spot with one outstretched arm, standing on tiptoe. He had a magnetized hammer with a long handle, and in his mouth a few tacks. He put one tack on the hammer, point outward, and with one tap sunk it into the required place to secure his card out of reach. Recently, in South Brooklyn, a tall bill-poster pursued this plan of posting advertisement-cards on telegraph poles so high that it required the line-men to climb up the poles to get the cards down.—*Ex.*

Extra Work on Buildings.

It is of course open to the builder to prefer a claim for extra work. Then come other evils. The claim is perhaps compromised. Omissions are made to set against extras; this may be just as between the architect and the builder; but is it just as between the architect and the proprietor? If the "extras" were necessary, and the "omissions" were likewise necessary, the house must orginnally and eventually have been a long way removed from the requisite completeness. If the claim is allowed, the builder receives justice. But how stands the case with the architect and the proprietor? It is then the latter who pays the penalty of his adviser's negligence. If, as sometimes happens, the claim is disputed, an angry controversy ensues; and the architect being his own arbitrator, the builder goes to the wall. What then becomes of justice between the architect and the builder? If, as sometimes happens, the claim is wholly ignored, the architect carries the point, the proprietor has his house—but what becomes of justice between the three? Whatever works are necessary in the opinion of the architect, but not shown on his drawings, or set forth or implied in his specification, are justly deemed extras, justly claimed as extras, and should be justly paid as extras. To withhold payment for work executed is theft, as much as the willful omission of contract work is theft. It is all very well to point to the clauses of an ambiguous specification, clauses wide enough to embrace everything under the sun, and show that the building is to be given up perfect. Ideas differ widely as to perfection. The man who has tendered from an ambiguous specification thinks his work perfection when he has executed soundly all necessary works. The author of the ambiguous specification may include in his idea of perfection many other works not actually necessary. This, therefore, should be an axiom in the composition of a specification. Every essential work, and every work of opinion and taste, and all nice points of construction, should be clearly specified and explained; while all minor works, if not described at length, should be explicitly mentioned, or at least, clearly implied.

☞ **Subscription price of this journal is $2.00 in advance.**

Book Notices.

The Builders' Guide and Estimaters' Price Book.

This work is chiefly intended to assist the BUILDER AND CONTRACTOR, in making estemates of the cost of work they may be competing for. A great deal of information often required by contractors cannot be obtained without trouble and serious loss of time, consequently their, estimates are frequently guessed at, and then tenders for construction are either absurdly too high or ridiculously low. This little book is intended, in a measure, to remedy this defect in estimating, by bringing before the estimater the details to be estimated as far as possible, and their approximate cost. It is impossible, however, to quote prices that will suit every locality, or all time, but we have provided for this by leaving a blank column where prices may be entered in pencil to suit locality and time. The prices given in this book are only intended to form a basis upon which the contractor can place a percentage; they are approximately correct, but in all cases we advise a comparison with the prices current. We will send a copy to any address upon receipt of the publisher's price, $2.

The Modern House-Carpenter's Companion and Builder's Guide.

By W. A. Sylvester. Pocket size, 114 pages, 35 full-page plates. Cloth, price, $1.25.

Many workmen have wondered why some practical carpenter did not get up a hand-book on carpentering for the coat-pocket, which contained rules and illustrations for doing such jobs of work as are constantly required, with reliable information to assist in estimating the cost and other matters essential to carpenters and builders, that could be sold at a price within the reach of every workman. Here is just that book. It has much information not usually given in large and costly works on carpentry (of from $5 to $15), and will be of great convenience to workmen. Among the illustrations and descriptions of the different kinds of work are the following: Pitch, hip, valley, mansard, and French roofs, tresses, the angle rafter on a French roof, straight and winding stairs, splayed and circular work, mitering circular moldings, rake moldings, gothic and elliptic arches, etc.; also information to assist in estimating on stone work, brick work, framing and boarding, lathing and plastering, clapboarding and shingling; thickness and weights per sq. ft. of sheet lead and zinc for flashings, table of board, plank and scantling measure, table of braces, table giving the sizes, thicknesses and weights of sash for 2, 4 and 12 lighted windows, sizes of frames, and amount of line required for each weight; also sizes of sash for skylights and cellar windows; table of square roots of numbers from 1 to 100, table of diameters, circumferences and areas of circles, from 1-64 inch to 24 inches; table of decimal parts of feet and inches, with fractional equivalents, etc.; rules for estimating sizes of bins to hold a given number of bushels of grain, apples, or potatoes; or a given number tons of coal; for estimating size of tank to hold a certain number of gallons; table giving the weights of various materials, besides a few arithmetical rules and tables, including the metric system tables of weights and measures—making the handiest and most complete for the price yet published. It is a book which every workman should own, in order to accomplish his work properly, and to thereby fit himself to become a master of his trade, whether he intends ever going into business on his own account or not. The book is actually indispensable to the master carpenter or builder who would avail himself of every advantage that can be of service to him in his business. Copies mailed to any part of the United States on receipt of price.

The Slide Rule, Simplified, Explained and Illustrated.

Showing its wonderful powers of calculations, and its rapidity in solving all questions relative to MECHANICAL TRADES. Designed especially for the instruction of YOUNG CARPENTERS AND JOINERS.

The design of this work is to furnish a cheap and simple illustration of the marvelous powers of the SLIDE RULE, an instrument capable of giving the young carpenter a most thorough and practical instruction in the principles of his art, and clearly imparting the means by which difficulties may be overcome, and yielding an inexhaustible source from whence he may continually draw supplies to enable him to consummate his designs with vigor and success, thus preventing a waste of time, labor and material, which everywhere arises from want of knowledge and skill.

The slide rule is not a modern invention. It was known about the time Wm. Penn landed in Pennsylvania, and founded the city of Philadelphia. Yet, strange to say, after the lapse of so many years, an instrument combining so much of everything that a workman should know, has, in this country, been allowed to remain almost unknown, except as a tool for the most common purposes, entirely different from what was intended by its ingenious inventor.

We can heartily recommend this work to our mechanics, as par excellence the best book treating on the Slide Rule yet published. It is a large-sized book, illustrated by 32 full-page plates descriptive of the problems involved by the use of the Slide Rule, with a clear explanation of all the principles connected therewith.

We will mail a copy to any address upon receipt of the publisher's price, $3.

Proposed Plumbers' Registration Law.

In previous issues we have noticed the fact of a movement among the plumbers of San Francisco, having for its object the passage of a law by the legislature at its next session, which will confer certain powers upon the Board of Health, in reference to the sewerages and plumbing work of all buildings which may be erected after its passage, and requiring the registration of all master and journeymen plumbers, etc.

This is a movement in the right direction, but it will require very sound and far-reaching judgment on the part of those managing the matter, to so frame and shape the intended enactment, as to render its working and enforcement both practical and certain. It is a matter of question whether a law or "an act" of the character proposed by the printed form issued by the plumber's organization would furnish the remedy sought for, unless improved and strengthened in several particulars. While the object aimed at is to introduce and impose such restrictions and regulations in the execution of plumbing work as will prevent the terrible botchery heretofore so extensively practiced in this city and State, and while all competent and qualified plumbers will readily comply with the requirements of such a law, the tinsmiths, stove-dealers, tailors,. and other frauds who style themselves "practical plumbers," while enjoying no practical knowledge of the plumber's art, will also assume the forms of registration for the purpose of securing a legal badge as plumber, although in practice a mechanical ass. This feature should be guarded, and covered by the provisions of the law, so that those only who are qualified by thorough, practical experience as plumbers, or who have made plumbing and sanitary science a matter of intelligent study, should be permitted to undertake plumbing work. We contend that in all the mechanical departments of labor, where human life and health is to any considerable extent dependent upon the manner of execution, it is right and proper that laws should be enacted calculated to protect the public health. To prevent malpractice, and save communities from fraudism in medical science, the law provides that those who claim to be doctors must possess certain evidence as to their qualifications, in the form of diplomas, before they are permitted to avail themselves of the privileges conceded and accorded to those fortified with the necessary emblems of qualification. In numerous other connections, the right to practice and pursue is properly restricted and regulated by national and State laws; and there are numerous good and sufficient reasons why individual rights should be restricted by law in the matter of plumbing work, as its improper execution is one of death's most effective weapons in separating loved ones forever. We are aware that this more serious view of the matter does not receive the attention its nature and importance demands; still the great fact that tens of thousands die yearly through the agency of sewer-gas machinery—i. e., poorly executed plumbing work—remains and repeats itself every moment of time; and if the intelligent gentlemen engaged in the matter under notice succeed in securing the enactment of a law which will remedy the evils complained of, they will be entitled to everlasting remembrance by the community at large, and by the reputable architects in San Francisco in particular.

☞ **$10.00.** ☜

We will send the "California Architect and Building News" for 1883, and one copy of "Francke's Celebrated Work on Monuments," for $10.00. Every architect and marble-worker should have a copy of this work.

A GREAT MISTAKE.

Special to Those Who Advertise.

The advertiser who reaps the harvest from advertising is the man who keeps his announcements before the world all the time, year in and year out, when business is good and when business is dull. It is the spasmodic advertiser, the man who goes in for two or three months and then drops out for six months, who will tell you that advertising does not pay. Probably it does not pay him, but it pays his competitor who has the shrewdness and courage to keep his name and address staring people in the face all the time. If everybody was ready to buy a certain article at a certain season, and wouldn't buy at any other time, then advertising in this particular season would completely cover the ground; but people buy at all times, and if you want their business you mustn't drop out of sight, even for a day.

Fairbanks, the scale man, knew what he was about when he gave an advertising solicitor an order, although he had more business than he could attend to, remarking that his reason for doing so and for keeping his name constantly in print was to so familiarize people with his scales, that when a school-boy in the backwoods spelt *scales* he would think or *Fairbanks*. He knew, further, that the boy who connected his name with scales would sometime become a man and a possible purchaser.

We heard of a salesman not long since who happened to be traveling for a firm that didn't believe much in advertising. He said it took him longer to explain to customers who his firm was than it did to sell the goods, when he succeeded in making a sale.

The indirect effects of advertising are often far greater than the direct results. The head of a large house once told the writer that while his firm advertised to the extent of many thousands of dollars yearly, they received no orders to speak of direct from their advertising. The indirect results, however, were all that could be desired. No salesman has any occasion to waste his time in a historical and biographical description of the members of his firm. They are known wherever the English language is spoken and in other foreign countries.

The moral is plain—keep your name so prominently before the public in connection with the special article you manufacture, that when that article is wanted your name will instantly be thought of as the maker.

Sewer Gas in Barber Shops.

A new danger has been discovered by the *Lancet*, a danger of breathing sewer gas from the waste pipes of barber's basins, when being shampooed. The danger is the more serious, because the whiff of germ-laden gas would pass unnoticed among the scents and sweet odors of the barber shop, and the unconscious victim, while breathing rose and jasmine, would also be absorbing the bacteria of various diseases. Probably the basins of the aveage barber shop are no better plumbed than other fixtures, are untrapped wastes and syphoned traps may make as many open connections with the drain as are found in the average of other buildings, but, on the whole, we regret that the *Lancet* has directed attention to this subject, because it gives opportunity to the barber to ask the man in the chair to take one more article than is on the list now. When the present category of oils and scents, bay rum and hair reviver is gone through, there will hereafter remain the inquiry, whether the m. c. will not take a little disinfectant through an atomizer. On behalf of the shaved community we protest.

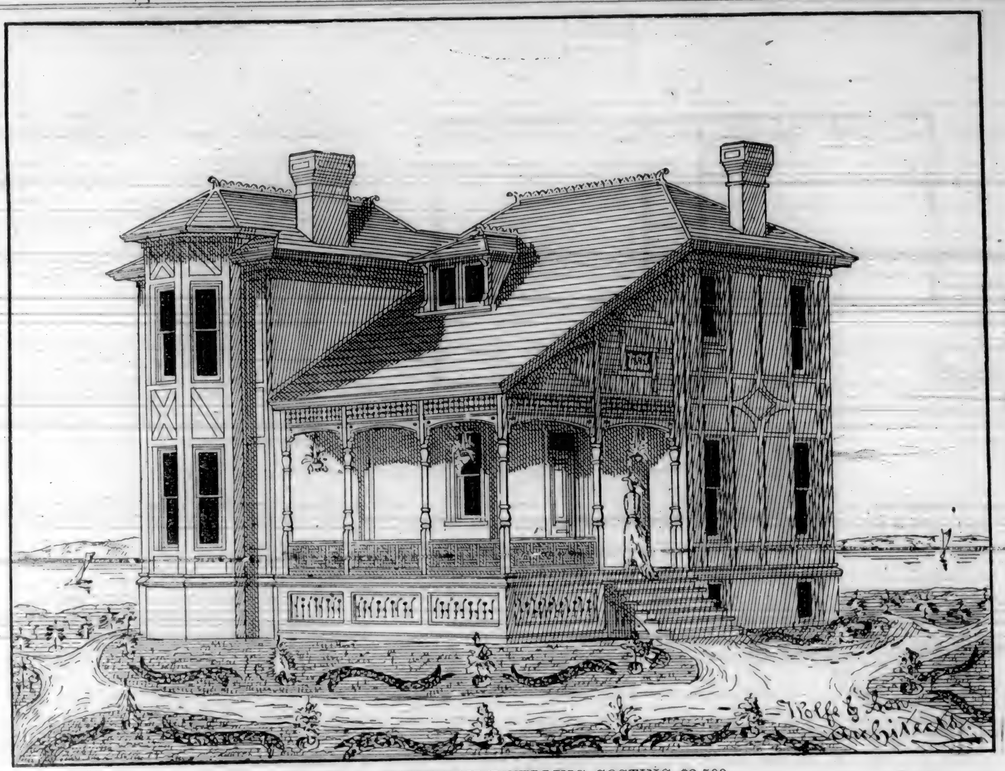

PLATE 4.—SUBURBAN DWELLING COSTING $3,500.

Tar Roofs.

The London *Builder* says that the German government has on several occasions pointed out to farmers and others interested in agriculture that too great an expenditure of capital on buildings is a mistake. With a view of illustrating the application of this principal of economy to roofing, the *Cologne Gazette* points out that the system of using tar for roofing purposes is at the same time economical and suitable for agricultural buildings, and what is said may serve as an answer to a recent inquiry in our own pages. The framework of the roof can be of relatively slight construction on account of the nature of the covering it is intended to support, and the perpendicular height of the roof can be one-eighth to one-tenth of the entire depth of the building. The distance of the rafters is arranged according to the width of the covering material, the scale being that from the middle of one rafter to the middle of another. The distance should be $2\frac{3}{8}$ inches less than the width of tar roofing sheets.

Immediately upon the rafters comes boards, and upon these (exactly in the center of the separate rafters) are placed strong laths, about 2 in. wide and $1\frac{3}{4}$ in. thick, the upper edges being taken off. The roofing sheets are now placed so as to cover the spaces between the laths, and are nailed. Over the laths are placed strips of paper, 5 in. to 6 in. wide, fastened with nails at intervals of $2\frac{3}{8}$ in.

In order to make the sheets lie smoothly upon the boarding, it is suggested, in case they are too dry, to soften them by immersion in water. It is recommended that the workmen should not wear heavy-nailed boots, and also, that if the rain comes on, the roof should not be walked upon immediately after. When the entire surface of the roofs is covered with sheets, the strips of paper (or caps) already named, as well as the joints, are painted over with a hot mixture of coal tar and pulverized lime. Pure dry sand is at once sprinkled over this coating, and particular care must be taken that all the nail-heads are well covered. When the paint is dry the whole surface of the roof is once more coated with the same mixture, and is sanded.

The object of this careful method of overlaying the roof with several coatings of specially prepared solutions is to preserve in the tar those oleaginous and fatty properties which it soon loses if exposed to the air, and the retention of which is an indispensable condition of its resistance to water. Clay and sand do not afford sufficient protection, and they are removed by violent winds.

Reference is made to various systems of coating the tar roof with protective substances, for the purpose indicated. One of the most successful methods consists of a mixture of cow dung and thin white lime, which is spread over the entire surface of the roof. If such a coating is not applied the tar paint must, during the first four years, be annually renewed, which enhances the cost of the roof. If the last-named protective composition is used, and renewed every two years, the coating of tar and lime can be dispensed with. Particular mention is, however, made of a coating of tax mixed with Portland cement, the tar being well heated and used in the proportion of 111 pounds to 200 pounds of cement. The mixture should be kept well stirred during the preparation, and should be applied as soon as made. This particular method has been tried in many cases in Germany, and, according to the journal quoted from, its satisfactory results have caused its adoption upon a scale of progressive importance.

Re-gumming Circular Saws.

It is estimated that three times re-gumming a non-perforated circular saw costs nearly the price of a new saw. Perforations in the line of the gullet lessen this cost. The metal in the track of the perforations is softer than the teeth, because the sawdust left in them when the plate is scoured, after tempering, burns when the plate is flattened, and draws the temper of the holes.—*Grimshaw on Saws.*

Breathe pure air, if you would have sound lungs. It is wicked for a young girl with weak lungs to sit on the anxious seat in a house of prayer, where the exhalations of a thousand bodies and the poison of carbonic oxide fill the closed room, even if the preacher seems to her like God's angel. Pure air in the house, pure air in the hall, pure air in the workshop, pure air in the church—this is the prime necessity, and without this, upholstery and painted glass, and labor-saving inventions, and the prayers of the man of God, are all mockery. The gospel of pure air is the saving gospel to those who mourn that so many are cut off in the morning of their days, and that consumption is the scourge of the race of man.—*Herald of Health.*

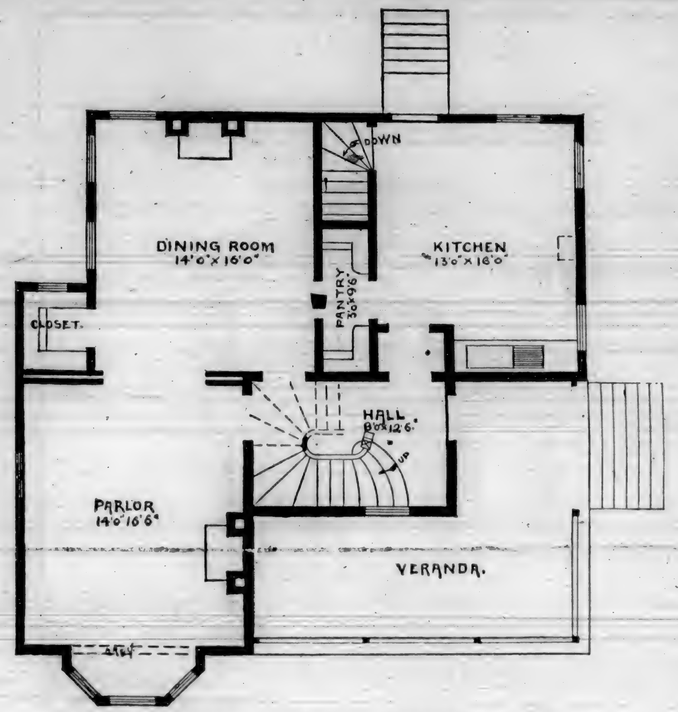

PLATE 5.—FIRST FLOOR PLAN OF SUBURBAN DWELLING.

EVERYBODY'S COLUMN.

"FAS EST AB HOSTE DOCERI."

"To find the inclination of roofs that the shingles may last the longest."

The shingles will last the longest (other things being equal) when the roof dries more quickly which will be the case when the water runs off as rapidly as possible.

We have not space to print the full algebraical solution, but the result shows that the height of the roof above the eaves should equal half the width of the house—that is, one half pitch. In practice, however, roofs are seldom made so steep in this part of the country.

FRIEND ARCHITECT: Please tell me how to compute the number of joists it takes in a building when spaced 16 inches from centers.

AMATEUR.

ANS.—Multiply the length of the building in feet by 3, and divide the product by 4. For instance: the building is 124 feet long = $124 \times 3 = 372 \div 4 = 93$, the number of joists required. This rule is applicable, no matter what the thickness of joints may be, as long as they are spaced 16 inches from centers. Allow one extra, except when the end sills are utilized in place of joist. Of course deduct when the latter is the case.

During a recent tornado in Brewer, Me., a plank was blown with such force against a cistern with wooden walls an inch and a half thick, that the board penetrated some distance through the wall into the water. It was found that the board was wedged in so closely that the water did not leak, and the owner simply sawed the plank off, leaving the wall in the cistern all right.

We will send the "California Architect and Building News" for 1883, and one copy of "Palliser's Useful Details," for $3.50.

The Gig Saw.

The spring strained saw, commonly known as the gig, jig, fret, or scroll saw, has a pull cut only; the return being effected by the same means that keep it strained. It is light running, and generally used for cutting out fine curved or scroll work, although of late years the band saw is superseding it for outside work.

Gig sawing really divides itself into two branches—sawing in irregular shapes on the outside of a piece of material, and the same process on the inside, known as fret work.

The short and readily detachable blades of the strained gig saw can be so quickly withdrawn from one cut and inserted in another starting hole, that the band saw has no chance to enter the field of fret work.

It may be said to have influenced American architecture, which seems largely to have been arranged so as to give every opportunity possible, from crest and barge board to porch and railing, for the display of scroll sawing.

Regarding the antiquity of the saw, it is instanced that a frame saw is shown in a painting of Herculaneum. The sawyers are at each end, one standing and the other sitting. The bench to which the timber is secured by clamps is supported by four-legged stools. The saw blade is strained in the middle; the teeth stand perpendicularly to the plane of the frame. Frame saws were common in Egypt many centuries previous to this time.

We will send the "Science of Carpentry Made Easy" and the "California Architect and Building News" for one year, for the sum of $5.50.

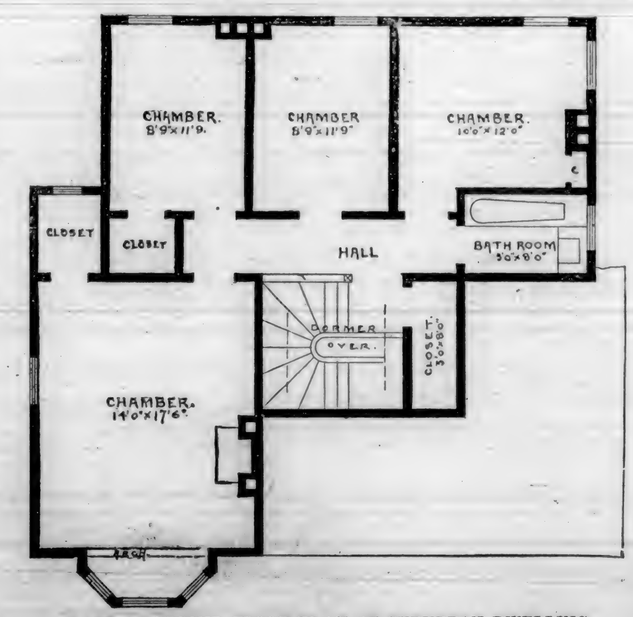

PLATE 6.—SECOND FLOOR PLAN OF SUBURBAN DWELLING.

Sixteenth Annual Session of the American Institute of Architects.

The Institute convened in annual session at Cincinnati, Oct. 26th, 1882. In the absence of President Walter, E. S. Littell of the New York Chapter presided, A. J. Bloor performing the duties of his office as Secretary. The annual address was delivered by Col. George Ward Nichols of the Cincinnati College of Music. The various reports of officers, trustees, and committees were received and duly acted upon; also the names of new members elected since the session of 1881 as Fellows of the Institute, among which are the following from San Francisco: Seth Babson, G. W. Sanders, James E. Wolfe, John Wright, William Curlett, Thomas J. Welsh, (Augustus A. Laver has also been a Fellow member for many years, and it is mainly through his influence that the union between the San Francisco organization and the parent institution was brought about. This representation of seven members in the grand body gives to California rather more than its quota, as the total membership of the Institute is restricted by its laws to seventy-five). Various subjects and matters of interest were introduced, discussed, and considered, bearing upon the numerous important features involved in the science and practice of architecture in its more intelligent and comprehensive senses. The matter of increasing the limit of membership to one hundred Fellows (without limitation to Associate membership) was discussed at length, together with other changes in the present rules and organic laws of the Institute.

At two o'clock the officers and members and invited guests of the Institute sat down to a sumptuous repast and enjoyed the hospitalities of Cincinnati Chapter. The remaining hours of the afternoon were spent in visiting the various more important buildings of the city; and, by special invitation of Mrs. George Ward Nichols, the Rockwood pottery. The citizens of Cincinnati seem to have vied with each other in extending invitations and hospitalities, and the Merchantile Library threw open their doors for the free use of the members of the Institute.

The evening session was called to order by the president *pro tem.* The nominating committee reported the following as officers for the ensuing year: For President, Thomas W. Walter of Philadelphia; Treasurer, O. P. Hatfield, New York; Secretary, William R. Ware, New York; Board of Trustees, H. M. Congdon, I. C. Cady, A. J. Bloor, Napolean Le Brun, all of New York; Committee on Publication, A. J. Bloor, New York; H. H. Holly, New York; John McAuthur, Jr., Philadelphia; Geo. C. Mason, Jr., Newport, Rhode Island; Committee on Education, Professor W. R. Ware, New York; Professor N. Clifford Ricker, Champaign, Illinois; H. Van Brunt, Boston, Massachusetts; Alfred Stone, Providence, Rhode Island; A. Potter, New York; Secretary of Foreign Correspondence, T. M. Clark, Boston; all of whom were unanimously elected. The thanks of the Institute were expressed by a rising vote to retiring Secretary Bloor, for his efficiency as Secretary during the term of his office.

The second day of the session was opened at 10 A. M. A salutary letter from San Francisco Chapter, and communications from other sources, were read.

The report of the Secretary for Foreign Correspondence was read, giving among other things an account of the discovery of the remains of an important Roman town near the City of Thomar in Portugal, made by the Chevalier de Silva, of Lisbon. It was known that Thomar was situated upon or near the site of the Roman town of Nabactia, but no important traces of the latter have been found until M. de Silva, amusing himself during a morning walk in the fields by turning over a few sods with his cane, almost immediately exposed a fragment of mosaic pavement. The discovery was followed up, and it appears from his last letters that other pavements have been found, and the forms and situation of the principal buildings of the ancient city ascertained.

Mr. Clem Olhaber, smoke inspector of Cincinnati, made statements in reference to smoke consumers. He stated that there were 400 smoke consumers within the circuit of his duties, working well and satisfactory to all parties, and that he met with but little opposition to the enforcement of the smoke ordinance. (It is about time that smoke consumers were ordinanced into use in San Francisco. We see no good reason why persons or companies should enjoy rights and privileges in the erection of smoke stacks and chimneys, to the injury of large districts of valuable tenement property and residences. And as our cable-street railroads and others disregard the interests of the cummunity in this respect, they should be compelled by imperative laws to comply with the laws of equitable rights, which recognize no privilege in any person or persons to enhance their own interests to the injury of others.)

Mr. A. C. Nash of Cincinnati read an able paper "in regard to the establishment of a valid test of professionable ability," in which was urged the establishment of a board of examiners, composed of gentlemen eminent for their professionable attainments, whose duty it should be to ascertain by rigid examination the qualifications of candidates for degrees, with vested rights to grant diplomas in accordance with the rank and standing of the applicants.

(There should be National and State boards of this character, established by Congress and State Legislatures, so as to prevent the assumption of the title of architects by those who arrogate to themselves the name of architect, while grossly ignorant of the grand principles and science upon which architecture rests. We shall revert to this subject hereafter.—Ed.)

An elaborate paper by Glenn Brown of Washington, D. C., in reference to "water-closets," was presented by Secretary Bloor. (It will be remembered that a series of articles written by Mr. Brown especially for this journal appeared in its columns during the past few months.)

On motion of Mr. Crapsey, the convention adjoined to meet at Providence and Newport, subject to the call of the Board of Trustees.

The session throughout appears to have been pleasant in a general sense to those attending, and especially profitable in the numerous valuable matters and subjects introduced. The Institute is certainly doing a good work by its organization, and the intelligent and educated of the profession should to a man, by their membership and attendance at its yearly gatherings, assist in the grand objects of the Institute, thereby, to some extent at least, helping to resist and hold back the tide of degeneracy which has to so large an extent flooded in upon the profession through the encroachments of unqualified pretenders and the indifference of the truly qualified to defend and sustain their high calling in life.

An old Hungarian miller is reported to have given this rule for telling a good millstone: "When about to select a stone, take a flask of gin and pour it upon the stone; if the stone absorbs the liquor so that the surface appears dry, it is a good one; but if the gin remains on the surface, the stone is good for nothing."

We would suggest that the same rule will not apply to the selection of a miller.

☞ **Subscription price of this journal is $2.00 in advance.**

More Railroad Inventions Wanted.

With the rapidly increasing traffic on American railroads there is a demand for greater facilities for loading and unloading freight. It would seem that an improvement in the construction of warehouses might be made that would render the rapid handling of heavy freight an easy matter, as compared to the present clumsy and inconvenient structures.

There is hardly any country station but has more or less heavy freight to handle, and frequently much trouble is experienced for the want of proper appliances for the work. Of course at terminal stations something has been done by way of cranes and derricks, hoisting machinery, etc., but even the best regulated warehouses are open to radical improvemeuts in apparatus and appliances for moving heavy as well as light and bulky freight. This is worth the study of inventors.

There is also a chance for improving platforms, so that moving goods from the cars to the warehouses may be an easy matter, without the use of the ordinary trucks.

Another thing that interferes with the rapid handling of freight is the location of the doors of freight cars midway between the ends. Ordinarily, this is the proper place for the door, and is preferable for a single door. But if a car were so constructed that goods could be loaded in any part of its length, it would certainly be more convenient than with a central door. This might be accomplished by constructing the car with a system of slide doors the entire length of its sides, so that a car might be loaded in sections, and much sooner than if loaded from the middle. This would also facilitate unloading. Appliances for loading and unloading goods from platform cars are nearly satisfactory, but may be improved.

This is an inviting field for the inventor. But if any American inventor would reach the top of the ladder of fame at a single bound, let him produce a station indicator that will inform railway passengers where they are when they arrive at a station. How well the human machine fails to do this is well known by every railway traveler. For a brakeman to speak the name of a station so that any human being can understand it seems to be one of the lost arts, and it remains for the inventor to produce a substitute to perform this duty. This has already been accomplished so far as "braking" is concerned. Now let us have a reliable station indicator.

Then there is a want of a humane invention to prevent people being caught in frogs and switches, guard rails, etc. Hundreds of people are killed or maimed every year by being caught in the "boot-jack" portion of frogs and held fast, and run down by cars or locomotives. This trap is a peculiar one. A person slides his foot into the wedge-shaped opening, where it is held in horizontally, while the rail heads prevent his lifting his foot vertically, and before he can extricate himself he is a mangled corpse. Some devices have been tried to prevent these horrors, but none is effective. It will not do to fill this space with any rigid substance, for the wheel flanges must have room. Some yielding substance, as a spring, may be made to fill the space, so as to keep the feet out of the trap and yield to the pressure of wheel flanges. This is a serious evil, and there is no doubt that the railway community will reward the inventor who will produce an effective remedy.—*W. S. H., in Scientific American.*

A log was recently cut on Skagit waters, Puget Sound, which was nine feet in diameter at the stump. The first cut was 24 feet long, and the next log 32 feet in length, and 78 inches in diameter at the big end, while the third was 36 feet long, and measured 63 inches—in all 92 feet of logs, and an average diameter of over five feet.

ACME VENTILATOR

This is of double the usual power for producing a vacuum for the Exhaustion of Sewer Gas, Foul Air, or for increasing Chimney Draft, and the Principle is equally applicable for raising water as in that of a Steam Injector, and with increased power to those in general use.

By reference to the illustration it will be seen that the chamber C is for the exit of the contents of pipe or pipes D, which is in communication with the apartment or apartments below to be acted on. The chamber C is surrounded by the atmospheric current BB, passing by its mouth between the COWLS, and it also surrounds the atmospheric current passing through the center at A. By this means the inside and outside, (all around) the mouth of the exit chamber C is acted on to produce a partial vacuum by both atmospheric currents of double the usual power for exhausting the sewer gas, foul air, or increasing the smoke draft, or other gaseous substance to be drawn up and floated away in space. In some devices the mouth of exit pipe C is only surrounded by one passing atmospheric current BB, and in others it surrounds and receives only the influence of the atmospheric current at A passing through the center, neither combining but the single feature and acting on one edge only; while this device combines both features, acting on both edges to draw and drain the whole. In the devices mentioned having the influence of but one atmospheric current, may be likened in a degree to that of a stream of water quiet in one-half its width, and the other half, by an incoming stream, may be moving rapidly forward. The action of the water at rest where the moving current impinges on its side is not to move it forward as a whole, but to reverse the motion in part as it approaches the bank or shore, as the shore retains its hold in its quiet state, as that of the moving current opposite is to move it forward, hence reverse action takes place near the shore to that of the moving current which cause the eddies we see along the shores of our rivers. The point or line of inertia of a large body acted only upon at its rim or edge, instead of effecting to move its whole area, is likened to the instance mentioned. The atmospheric pressure at the earth's surface is fourteen and three-fourths pounds per square inch, or 2124 pounds per square foot. The passing through of the two atmospheric currents B and A, shown in the drawing, creates a partial vacuum by its operation on both sides of the mouth of the chamber C, and the atmospheric pressure at the lower end or connections of pipe D, being fourteen and three-fourths pounds to the inch, forces up the foul air, sewer gas, or whatever may be the contents of the apartments below to restore the equilibrium.

The principle of this device is equally applicable as an improved steam injector, the steam passing through the chambers B and A, which are of diminished size and enclosed at one end, creating a vacuum in chamber C, which will have great power for lifting liquids as well as gasses.

FRANKLIN GIRDER

The Most Economical Construction Made.

It is so proportioned and equalized that the opposing forces and strains in a great measure neutralize each other, by which means the material in use is economically employed, so that the price for them for buildings is **about one-half of those in common use in this city.** They are made of any length and to sustain any desired load: the proportion of the safe to the breaking load being as 1 is to 3, or for a girder to sustain 100 tons, the breaking load will not be less than 300 tons, and guaranteed as such in every case. The scientific Press of this country and Europe have most favorably commented on this invention, as the Scientific Press, Scientific American, Railway Review, The California Architect and Building News, and Architect and Builder; also the London Engineer, and Paris and German scientific Papers. Two of these girders, 25 feet long, sustain the front wall, 17 inches thick, of Mr. Somer's new building on Market Street, opposite Dupont Street, this city. The rise or verse sine of these girders for the bay windows over them can be kept within any limit usual in such cases. They are made of any length **for buildings** not to exceed 50 feet, and to sustain any load not exceeding 1000 tons. For Bridges, the length and sustaining capacity may be increased.

Architects' Superintendence.

A case of considerable importance to architects and employers came before the Nottingham County Court recently, and is reported in the *Building News*. The simple facts of the case were these: An architect of the above town sued a local physician for the balance of an account owing for professional services. The defendant instructed the plaintiff to prepare plans for a house in the "Æsthetic style." A tender was accepted, and the plaintiff informed the defendant that it was necessary to appoint a clerk of works, as it was not expected that an architect could visit the building more than twice or three times a week, and it was the duty of the clerk of works to superintend the minor details. The defendant, however, thought a clerk of works unnecessary. The building was finished, and the plaintiff sent in his account; but the defendant paid only a portion of it, as he contended there were certain details not properly carried out, that the drains were defective, and the house consequently unhealthy. It was contended at the trial that these were details which could not properly come under the architect's notice; but that would have been obviated by the employment of a clerk of works. His honor took this side of the matter, and ultimately a verdict for the plaintiff was given for £25 and costs. The case has more than one point of interest for the architect and the employer: there is a certain amount of supervision expected from the architect, under the ordinary and customary usage of the profession. What does this consist in, and how many visits ought an architect to make a week to a building which he has undertaken to superintend? It so happens there is no written or traditional rule of the profession which defines such attention, and that in point of fact architects have to consult their own time and convenience in superintendence of works under their charge. It is a hard thing to say how much attention an architect ought to give to a work. The answer would necessarily depend on various considerations: the kind of contractor employed, his character for honesty and integrity, the class of building, whether it required more than usual care in details, the size and cost of the building, etc. It would be simply impossible to lay down a hard-and-fast rule: each case must be judged on its merits. Of course it is no excuse for an architect to plead a large practice, and that in consequence he could not make so many visits to a certain building; the cost of the building ought not also to have anything to do with the superintendence: for if an architect, in however an extensive a practice, takes a work, he is expected to carry out his engagement as much as any less busy practitioner. And men of large practices can well afford to leave small works to small men. An employer at least expects to receive from his architect such a fair amount of supervision as will guarantee to him that the work has been carried out in accordance with the design and intention of the specification; and yet it is possible to conceive such an amount of supervision inadequate to detect errors in workmanship or scamped work, such as bad drainage details. For example: no ordinary amount of supervision on the part of the architect can obviate such a blunder as giving a drain a deficient fall, of making a clumsy or imperfect junction with the sewer, of seeing that every pipe is sound and well jointed, or that the joints and workmanship of the interior sanitary arrangements are perfect in every detail. These are things likely to be neglected directly after the architect's back is turned. Nor, for the same reason, could an architect be charged for negligence in not detecting every bad brick or piece of timber introduced. It would be clearly out of reason to expect him to be always present on the works and watch everything done or every material brought into the building; so that the superintendance of an architect can only be reasonably understood to mean a general inspection of the works, and this is the opinion the judge of the Nottingham County Court formed upon the evidence adduced. Referring to the details, he said "these were clearly the duties of a clerk of the work, and if the defendants did not choose to engage one, he must abide by the consequence, for an architect could not be expected to be present to superintend these details."

The law affecting building contracts is not very explicit with regard to the question of the architect's duties in this respect. The law imposes on an architect, that he should be duly qualified to practice his profession, and that he should use a reasonable amount of care and skill in its practice. In ordinary contracts there is nothing said about what an architect's superintendence means. No case appears to have been decided, which defines the limits of the architect's authority in the general superintendence of works, and in the absence of such terms the duty has to be implied, and the law, indeed, dictates what any prudent man would consider fair. When an architect undertakes to superintend the erection of a building, he is supposed to exercise a reasonable amount of skill and attention, and the law would imply neither more nor less. The case we have quoted so far defines the limit of the architect's duties in respect of general superintendence, and, in the absence of an express agreement, the evidence of usage only is admissible. It is to be regretted that we have no decisions or legal authority which define the architect's duties with regard to superintendence, for them is ample evidence in the architect's practice to prove that much of the success of a contract work depends upon the attention given to details. Yet the case decided the other day shows what the legal mind would understand as reasonable in similar cases, and to this extent it will be useful as an authority.

Our readers may ask what is implied by reasonable superintendence. It is quite certain, as we have said, that an architect can only be required to exercise a general supervision over the works. The setting out of the building correctly, the construction of the walls and floors and roofs, so far at least as they relate to their proper thickness, materials, and strength to resist pressure or weight, are all matters which strictly come within the architect's duty to see properly executed, as these are all matters for which his skill as an architect has been retained. They are matters also which always upon the proper carrying out of the drawings and specifications, for it is very evident if a wall blew or fell down, or a floor gave way, it would imply a want of due skill in proportioning the thickness of the wall or the beams of the floor; and as these things are shown in drawings, the architect is reasonably expected to see that they are carried out. But it may be fairly surmised that he cannot be held responsible for the introduction of inferior materials, or even for the bad workmanship of any part of a building over which he can only give a general supervision. If a wall gives way or a floor breaks down from bad material introduced in the substance of it, or from an imperfect connection or detail, which could not reasonably have been inferred from the specification and intention of the architect, he is clearly not liable, but the builder is the responsible party. Of course, we are supposing no case of negligence on the part of the architect to be proved. By the French code both the architect and the builder are liable during ten years for negligent construction, and a similar code, we believe, is in force in Lower Canada. With regard to drains, they are generally left to circumstances, and the architect rarely does more than indicate their position on the plan. The levels, joints, and junctions, are points which, however important to be attended to, cannot fairly be said to come within the architect's general superintendence, as usually implied in building contracts. The law, in fact, holds the architect responsible for all relating to design and construction, but cannot require him to exercise the same care as regards workmanship, as it would be unreasonable to suppose he could always be on the works. The question, indeed, is of such vital importance to architects, that it naturally brings to the front another of considerable moment; namely, the employment of a clerk of works. It seems to us that architects whose practice is extensive should require in all cases the employment of clerks of works. In country practice of a moderate kind it is usual to do without their services, yet the saving is dearly purchased, and the demands made on the architect become more onerous. It is to the interest of the architect that a clerk of works be employed, and it is certainly to the interest of the employer. In no building is it possible to see that all the materials and labor are of the nature described in the specification and shown in the drawings, without one; and we think it the duty of the profession to lay down some rule by which they may place themselves in a position of independence. When ought the clerk of works to be employed, and on what kind of work? are questions that might very well be left to an architect's discretion. In the case we have mentioned the plaintiff informed his employer that a clerk of works must be engaged, as an architect could not be expected to visit a building more than twice or three times a week. The defendant refused to have one, and the result was that the drains were defective. The judge observed, with much truth, that a clerk of works could not be considered merely as an ornamental appendage, for, as a matter of fact, the duties he was expected to perform were of a very important character. If architects desire to maintain their position as general supervisors of buildings, the sooner they come to a decision on these questions the better; and the employment of an efficient clerk of works ought to be considered almost as necessary a condition of good building as the employment of an architect.

Items of Interest.

A new form of window is being introduced in London, England, for preventing accidents in cleaning, and securing good ventilation. The two side-bars of each of a pair of ordinary sash frames are divided into two parts vertically, and the part carrying the glass is swiveled or pivoted in the side pieces, at a point central to its height. The frame with the glass is held in position by two small bolts in the top rail, which shoot into the side strips. When this latter fastening is effected, the two sashes may slide up and down in an ordinary way. It will be seen that to clean this kind of window there is no necessity for servants to go outside.

The placing of the plumbing business of New York under control of the Board of Health is working a much-needed reform in that city. Instances are constantly coming to light showing that unscrupulous plumbers have greatly hazarded the health of their customers by dishonest work. This fact appears as often in the dwellings of the better classes, where expense has not been spared, as in the residences of poor people. Suits for damages have been successfully prosecuted against plumbers, in a number of instances. This new law requiring scientific inspection of plumbing works admirably in New York, and it would be well if it were enforced in all large cities.

☞ $10.00. ☜

We will send the "California Architect and Building News" for 1883, and one copy of "Francke's Celebrated Work on Monuments" for $10.00. Every architect and marble-worker should have a copy of this work.

Gas Traps.

Innumerable efforts have been continued for many years past, in the development of a perfect trap for the purpose of resisting the inlet of sewer gas at sinks, wash-basins, etc. Many of the attempts have been entire failures, only a few being found worthy of application. Among the very best in use is the device known as the *Garland Gas Trap*, which has met with extensive adoptions, is a California invention, and enjoys a good reputation, backed up by strong recommendations from those who have used them. Its construction is designed to complete a perfect seal against sewer gas, even after the trap shall have syphoned or the water forming the seal evaporated.

Index to Volumes I. to IV.

We are having carefully prepared a full index to all articles in volumes I. to IV. It will be of the same size as our regular journal, so that those who preserve their monthly issues for binding at the close of the year, by securing an index first, can have it bound with their monthly numbers. We will send one to every subscriber. Any one failing to receive it should notify us at once.

Mulay Saws on the Pacific Coast.

Mulay saws are very little used on the Pacific Coast. As far as we can learn, none are in use on Puget Sound, and only a few in Mendocino and Humboldt, the great redwood districts of California. There they are employed in a few mills only, to take the slabs off the largest logs, to reduce their size.—*Grimshaw on Saws.*

Indexed Atlas of the World.

But one copy remains of this magnificent work. They are not for sale in any bookstore, and it is but seldom that a copy can be had. This last copy is bound in half-morocco, and will be sent post-paid upon receipt of the price, $35.

Publication Notices.

All books noticed in these columns can be had at publishers prices at this office. Sent post-paid to any address.

PAINTS.—The price of paint has been reduced owing to the competition of Eastern firms. The best white lead can now be had for 6¼ cents per pound.

Building Intelligence.

The year just closing has been a very busy one in regard to building operations. In an article on the first page in this issue we give a *resume* of the year's work. We are preparing a general statement in regard to building activities on the Pacific Coast, and will give it in our January number. Our advices are up to the 5th of this month, and as we wish to give a report for the full year, we delay the information until the next issue. But few contracts have been let the past month. 1883 promises to exceed the present year in number and value of building improvements.

SAN FRANCISCO.

Market, x Seventh and Eighth. Two-story brick.
O.—Geo. T. Mayre.
A.—C. Geddes.
O.—W. E. Stevens.
$25,000.

Vallejo, nr Gough. Four one-and-one-half-story frame.
O.—Capt. Raymond.
A.—H. D. Mitchell.
C.—M. Lynch.
$3,500.

Geary, nr Buchanan. Two-story frame.
O.—A. P. Stanyan.
C.—Drury.
$3,500.

Pacific, nr Steiner. Repairs.
O.—Brown.
Days' work.
$3,000.

Waller, nr Webster. One-story and basement frame.
O.—C. Shephard.
C.—Wiseman.
$3,000.

Howard, nr Twelfth. Three-story frame.
O.—W. Patterson.
A.—W. H. Bayles.
C.—J. Dutton.
$5,500.

Greenwich, nr Webster. Four one-story frame.
O.—Mrs. Ring.
C.—H. A. Sheldon.
$4,000.

Pine, nr Mason. Three-story and basement frame.
O.—S. Burbridge.
A.—McDougall & Son.
C.—Cogswell.
$8,000.

Austin, nr Franklin. Two-story frame.
O.—J. Toothaker.
Days' work.
$1,500.

Foot of Taylor St.—Repairs.
O.—Triton Boat Club.
A.—T. A. Eisen.
C.—F. Acker.
$900.

Golden Gate Avenue, x Franklin and Gough. Alterations.
O.—Mrs. Mocker.
A.—Townsend & Co.
Days' work.

Union nr Steiner. Additions.
O.—F. Pixley.
$1,000.

Julian Avenue, nr Fifteenth.
O.—T. H. Bonney.
C.—J. H. McKay.
$3,000.

Nevada, nr Utah. One-story frame.
O.—P. Biggins.
$2,000.

Montgomery and Sacramento. Repairs and additions.
O.—A. B. Crogan.
A.—J. Marquiz.
C.—J. V. Lawrence.

Stockton and Post. Additions.
O.—Staahl & Maack.
$500.

Steiner and Jackson. Repairs to school-house.
C.—N. Murphy.
$1,200.

Ohio, nr Broadway. Repairs.
O.—F. Beger.
C.—J. Bonde.
$700.

Seventh, nr Bryant. One-story frame.
O.—E. Painter & Co.
Days' work.
$2,500.

Sutter, above Dupont. Fitting up store.
O.—M. Gray.
A.—H. D. Mitchell.
C.—Jas. Geary.
$1,900.

Devisadero, x Ellis and O'Farrell. Two-story frame.
O.—J. McDonald.
A.—T. J. Welsh.
Days' work.
$5,000.

Fremont and Harrison. R. C. church.
A.—P. J. Welsh.
C.—A. G. Fitzpatrick.
About $12,000.

Twenty-third, nr Valencia. Two two-story frame.
O. & B.—F. Crowley.

Lyon, x Clay and Washington. One-story and basement frame
O.—L. P. Rixford.
A.—R. Warren.
C.—Bruce & Rose.
$2,000.

Beale, No. 123. Three-story Frame.
O.—J. R. Sims.
Days' work.
$3,000.

SACRAMENTO.

Twentieth and I. One-story and basement frame.
O.—F. H. Coffman.
C.—J. L. Atwood.
$2,000.

Twentieth, x I and J. One-story and basement frame.
O.—N. G. Eldred.
C.—J. L. Atwood.
$1,000.

Twentieth, nr I.—Improvements.
O.—Siebenthaler.
$600.

H, nr Seventeenth. Two one-story and basement frame.
O.—F. Kern.
C.—Vandercook.
$3,400.

Twelfth, nr G. One story and basement frame.
O.—C. Estee.
O.—W. H. Mead.
$1,200.

H, nr Seventeenth. One-story and basement frame.
O.—Y. W. Gunn.
Days' work.
$1,400.

Seventh, x M and N. Two one-story and basement frame.
O.—Bates & White.
A.—T. J. Hamilton.
C.—Vandercook.
$4,000.

N, x Seventeenth and Eighteenth. Two-story frame.
O.—H. Elliot.
Days' work.
$2,500.

J and Eighteenth. One-story frame.
O.—W. Kass.
C.—U. M. Reese.
$1,200

Twenty-third, x F and G. One-story frame.
O.—G. S. Nichols.
C.—W. J. Renfro.
$900.

STOCKTON.

Washington, nr Pilgrim. Two-story frame.
O.—E. Peyton.
A.—C. Beardslee.
C.—L. Furry.
$5,000.

Center, nr Market. Additions.
O.—W. R. Clark.
$1,200.

Fremont, cor Sutter, Two-story frame.
O.—Wm. Wrench.
C.—H. F. Larribee.
$4,500.

Sutter, nr Fremont. One-story frame.
O.—W. Wrench.
O.—H. F. Larribee.
$1,800.

Market, cor Pilgrim. Two-story frame.
O.—Hasson.
Days' work.
$3,000.

ALAMEDA.

Park, cor Encinal. One-story cottage.
O.—Adler.
C.—A. C. Gilbert & Co.
$2,000.

Park Avenue, nr Encinal Avenue. Additions.
O.—J. B. Vosburg.
Days' work.
$2,500.

Santa Clara Avenue. One-story cottage.
O.—Mrs. Schmedeka.
C.—James Millington.
$2,000.

OAKLAND.

Madison, x Fifteenth and Sixteenth. Two-story frame.
O.—Dr. Merritt.
Days' work.
$4,000.

Harrison, nr Tenth. Repairs.
O.—Waite.
C.—McKillican.
$3,000.

Tenth, nr Franklin. Alterations.
O.—R. P. Thompson.
A.—W. Patton.
C.—C. A. Ingerson.
$7,000.

Twentieth and Curtis. One story and basement frame.
O.—N. R. Holinquist.
$1,000.

Fourteenth, nr Castro. Repairs.
O.—G. W. Martin.
$600.

Jefferson and Fourteenth. Two-story and basement frame.
O.—I. E. Thayer.
C.—F. A. Brown.
$4,500.

MISCELLANEOUS.

Santa Rosa. One-story brick.
O.—Overton.
C.—T. J. Ludwig.
$5,100.

Lathrop. One-story frame.
O.—J. Geraty.
Days' work.
$600.

Vacaville. Two-story and attic frame.
O.—Burpee.
A.—Taylor & Copeland.
$2,500.

Menlo Park. Lodge building.
O.—R. Burke.
A.—T. J. Welsh.
$2,500.

Extra Inducements to Subscribers for 1884.

Mechanic's Geometry, or the Science of Framing by the Aid of Card-board Models. With the aid of card-board models, and the rules and explanations given, the mechanic can readily learn the method of getting the length and bevels of every description of rafters, hoppers, etc. Stair work is also treated in a manner that at once arrests the attention of the student, and becomes an attractive study. This book will also be found useful, though possibly in a less degree, to those who have already become mechanics, but who have not learned the science involved in their trade. The main object of this work is the elevation of the working man to the dignity of the master mechanic. Price, $5.00.

One copy of the above and one year's subscription to the CALIFORNIA ARCHITECT for $6.00.

The Artisan. Among the practical ideas in this work will be found the utility of the right angle, and its application in a lying many useful problems. By means of a right angle the exact circumference of a circle is determined, once. It also shows a simple and correct method for the measurement of boards, floors, and other surfaces. It is applied to lines of any length, and divides them into equal parts. It gives the cuts and lengths of rafters, braces, and other timbers in framing. There can be no doubt as to the value of a right angle and its utility in this connection. It is clearly illustrated in the *framing square*, a tool which solves nearly every problem in practical geometry. Price, $5.00.

Book and one year's subscription for $6.00

American Cottage Homes. This work has had an unprecedented sale in the United States since the reduction in price. The book is a large one, and contains many illustrations in the prominent later styles of architecture. Prices are given for which each design can be built. In California, however, the price in nearly every instance would have to be almost doubled to correspond to cost of work in this State. Being sole agents on this coast for the above work, we are prepared to make liberal terms to agents. Price, $3.00.

Book and one year's subscription for $4.25.

Complete and Comprehensive Details. This is the first work of its kind ever published in this country. The author justly remarks, "Ideas are as necessary as tools. Tools have no edge without them." These details furnish the mechanic with nearly eleven hundred ideas, and practical ideas that you want every day. Forty plates, 20x26 inches in size, are given for the small amount of $2.00. AGENTS CAN MAKE $5 00 PER DAY STEADY, HANDLING THIS WORK. Being sole agents on this coast, we are prepared to make liberal terms to canvassers.

Book and one year's subscription for $3.25.

Modern House Companion and Builders Guide. A hand-book of carpentry for the coat pocket. Among the illustrations and descriptions of the various kinds of works are the following: Pitch, hip, valley, and mansard roofs, angle rafters on French roofs, mitering circular mouldings, sash work, etc. Every mechanic should possess a copy, and thereby fit himself to become a master of his trade. Price, $1.25.

Book and one year's subscription for $3.00.

Grimshaw on Saws. The most complete work of its kind as yet written. A description is given of the manufacture of every kind of saw in use, with full directions for keeping them in order. Its chapters on filing and setting of saws, with descriptions of the best *nets* manufactured, are well worth the attention of every practical mechanic. New and enlarged edition. Price, $4.00.

Book and one year's subscription for $5 25.

Foundations and Foundation Walls. For all classes of buildings, pile driving, building stones, and brick, pier and wall construction, mortars, limes, cements, etc. Practical explanations of the various methods of building foundation walls for all classes of buildings, use of piles in building, etc. Price, $1.50.

Book and one year's subscription $3.25.

Lakey's Village and Country Homes. This is a large work, and just suited to those parties in the country who live too far away from an architect to secure his services. Designs are given for all prices of village and country homes. Several pages of details are also introduced. Price, $5.00.

Book and one year's subscription $6.00.

Builder's Guide and Estimator's Price Book. This work is chiefly intended to assist the Builder and Contractor in making estimates of the cost of work they may be competing for. It is written by the author of the "Steel Square and its Uses," which fact is a guarantee that the book is practical in its character. Price, $2.00.

Book and one year's subscription for $3.50.

Steel Square and Its Uses. Enlarged Edition. This work is just from the press, and those wanting copies should at once order them. It is a great improvement on the author's former work, containing much that is new to mechanics—some of the problems presented never having before appeared in print.

We are agents on this coast for this celebrated work, and will mail a copy to any address upon receipt of $1.00.

Book and one year's subscription for $2.50.

Science of Carpentry Made Easy. The work, *par excellence*, for every mechanic to have in his possession. It is thoroughly practical in its character, and contains much information not to be found in any other publication. It excels in its methods of obtaining the length and bevels of every description of rafters, both common, hip, and valley. Price, $5.00.

One copy of the above and one year's subscription to the CALIFORNIA ARCHITECT for $6.00.

Moor's Universal Assistant and Complete Mechanic. This book contains 1,016 pages. There is hardly a mechanical subject that does not receive the attention of the author. Receipts are given for *shop secrets* in every branch of the trade. Well worth the price, $2.50.

Book and one year's subscription $3.75.

Gould's Carpentry Combined with Steel Square Problems. The author, being a practical mechanic, has endeavored to make his ideas so plain that any one by reading, with a little study, can thoroughly master all the problems incident to the use of the Steel Square. Price, $2.50.

Book and one year's subscription $3.50.

Plaster, How to Make and How to Use It. It contains accurate descriptions of all tools and materials used in plastering; description and action of every variety of lime and cement; instructions for making all kinds of mortar, and doing all kinds of plain and ornamental plastering; many important recipes given. Price, $1.00.

Book and one year's subscription $2.60.

Workshop Companion. A collection of useful and reliable recipes, rules, processes, methods, wrinkles, and practical hints for the workshop. 164 pages of useful reading matter to all. Price, 35 cents. By mail, 40 cents.

Book and one year's subscription $2.15.

Practical Lessons in Architectural Drawing. There is not a draughtsman in this country but that will be benefited by the possession of this work. As its name implies, it is strictly a PRACTICAL WORK. Price, $2.50.

Book and one year's subscription $3.75.

Interiors and Interior Details. A large work, and as its name implies, contains details for every style of interior finish. The plates are all handsomely lithographed. Price, $7.50.

Book and year's subscription $8.75.

Hand Saws and the Art of Saw Filing. This book gives full information for putting in order all kinds of saws, from a carpenter's panel saw to a steam saw mill. Illustrated profusely. Price, $1.00.

Book and one year's subscription $2.60.

Lumberman's Hand-Book. Every carpenter, mechanic, lumber dealer, etc., should have this work in his pocket. Upward of 260 pages, filled with the most practical and useful information. Price, $2.00.

Book and one year's subscription $3.25.

Modern House Painting. A new work of novel design, presenting numerous elevations of houses in colors precisely as they will appear when finished. Price, $5.00.

Book and one year's subscription $6.00.

Modern Perspective. A perfectly new work. Should be studied by those who seek to excel. It is intended for the architect as well as the draughtsman. Price, $6 00.

Book and one year's subscription $7.25.

Monckton's Practical Geometry. A completely new work, comprising problems of practical utility to the workmen. Price, $1.00.

Book and one year's subscription $2.50.

Carpenter's Pocket-Book. The price of this work has been reduced to 50 cents.

Book and one year's subscription $2.25.

Modern Architectural Designs and Details. The plan of this work is very comprehensive in its character. Numerous designs are given illustrating the Eastlake, Elizabethan, and Queen Anne styles of architecture. Complete plans of each, together with full and comprehensive details, are produced in a manner that will gratify the tastes of any architect or property owner. Price, $10.00.

Book and one year's subscription for $11.00.

Detail Cottage and Constructive Architecture. To the general country mechanics, this work is invaluable. Every part of a building is thoroughly detailed including store fixtures, counters, fences, etc. Price, $10.00.

Book and one year's subscription $11.00.

Artistic Homes. A. W. Fuller, a well-known architect, has given to the general public, for a small price, a very neat work containing 44 plates in the Queen Anne style of architecture. Price, $3.50.

Book and one year's subscription $4.75.

Rural Church Architecture. Mechanics and others, in the country, will find in this work a great many plans for churches of moderate cost. Price, $4.00.

Book and one year's subscription $5.25.

Practical Perspective. With thirty-six Double-page Illustrations. Cloth $1.50.

Street, Store, and Bank Fronts. This book is complete upon the subject of which it treats. Price, $3.50.

One copy of the above and one year's subscription to the CALIFORNIA ARCHITECT $4.75.

Wooden and Brick Buildings. Two volumes, forming a larger collection of designs for buildings than any work yet issued. Price for the two $18.00.

Two volumes and one year's subscription $18.50.

Village Builder. The editions of this work are almost exhausted, and copies are scarce. Price $10.00.

Book and one year's subscription $11 00.

Practical Carpentry. As its name indicates, this work presents practical answers to those questions that so frequently vex the mechanic. Price $1.00.

Book and one year's subscription $2.60.

American House Carpenter. This work, by Hatfield, is justly regarded as the standard work on carpentry. Price, $5.00.

Book and one year's subscription $6.25.

Architect's and Builder's Companion. A new edition, by Vodges. Every mechanic should have one in his pocket. Price, $2.50.

Book and one year's subscription $3.50.

Model Homes. A work containing a great many designs in the prevalent New England styles. Price, $1.00.

Book and one year's subscription $2.50.

Building Superintendence. A new work and one that should be in the hands of every architect, contractor, and student. Price, $4.00.

Book and one year's subscription $5.00.

Cottage Homes. A new work containing numerous designs of styles in vogue in New York and vicinity. Price $5.00.

Book and one year's subscription $6.00.

Handrailing and Staircasing. A complete set of Lines for Handrails by "Square-cut System," and Full Practical Instructions for making and fixing Geometrical Staircases. By FRANK O. CHESWELL, of the Liverpool School of Science, Medallist for Geometry. With upwards of One Hundred Working Drawings. Cloth $1.50.

Book and one year's subscription $3.00.

Drawing for Carpenters and Joiners. With Elementary Lessons in Freehand and Object Drawing. Containing 250 Illustrations and Drawing Copies. Cloth, $1.75.

Book and one year's subscription $3.25.

Drawing for Bricklayers. With the Elements of Freehand, Object and Plan Drawing. Containing Two Double and Thirty-two Single Pages of Illustrations adapted for Architectural Drawing. Cloth $1.50.

Book and one year's subscription $3.00.

Drawing for Cabinet-Makers. With Lessons in Ornamental and Object Drawing; Elementary Instruction in Water-Colored Drawing. Containing Twenty-four Single and Five Double-page Plates. Cloth $1.50.

Book and one year's subscription $3.00.

Drawing for Stonemasons. With Elementary Lessons in Freehand and Object Drawing and a concise History of Masonry. Containing six Double and Twenty-five Single Pages of Illustrations. Cloth $1.50.

Gothic Stone Work. Containing the History and Principles of Church Architecture, and Illustrations of the Characteristic Features of each Period, the Arrangement of Ecclesiastical Edifices, etc. With Seven Double and Eighteen Single-page Plates. Cloth $150.

Building Construction, The Elements of and Architectural Drawing. With 130 Illustrations. 128 pp., Cloth $1.25.

Book and one year's subscription $3.00.

Linear Drawing and Practical Geometry. With about 150 Illustrations, and six Whole-page Diagrams of Working Drawings. 128 pp., cloth, $1.25.

Linear Drawing and Projection. The Two Vols. in one. By E. A. DAVIDSON. Cloth $1.75.

Cutting Tools Worked by Hand and Machine. By R. H. SMITH, Professor of Mechanical Engineering, Sir Joseph Mason's College, Birmingham. Price $1.50.

Book and one year's subscription $3.00.

Carpenter and Joiner. This most excellent work, by Riddell, is well worth study by every one who desires to become proficient in the mechanic's trade. Price, $7.50.

Book and one year's subscription $8.50.

American Stair Builder's Guide. With the aid of the rules and illustrations given, the young mechanic can, in a very short time, be enabled to lay out any and all kinds of stair work. Price, $3.00.

Book and one year's subscription $4.50.

Systematic Drawing and Shading. By CHARLES RYAN. Giving Practical Lessons on Drawing. Cloth, $1.25.

Building Prospects for 1883 in San Francisco.

At no time within the past ten years has the general business and monetary outlook, and the universal feeling of confidence among all classes, indicated more favorably than at the present time, particularly in building circles. There are numerous rumors of contemplated costly structures and business buildings afloat, which, if only in part carried into effect, will give employment to the greater number of house operatives, and absorb the entire working forces of really *qualified mechanics*.

In 1879, the number of unoccupied dwellings in San Francisco were variously estimated at from 1,200 to 3,000. During 1880 the greater number of these found tenants, in addition to the 397 new buildings erected during that year. In 1881, 533 additional houses were added, all of which were readily rented, but few of any class remaining unoccupied. During 1882, 785 new improvements were made, scarcely any of which remained empty one month after completion; and, as a rule, was rented prior to or immediately after completion, leaving still a large number of "house hunters" who have not been able to obtain satisfactory homes. Many desiring a change of residence have been required to hunt long and diligently, and in numerous instances, have been compelled to accept unsatisfactory places until more suitable could be found.

The question is frequently asked, What causes the recent and present demand for houses? The answer is found in the fact that the immigration to San Francisco, and the natural increase of population, have largely augmented the number of inhabitants; in addition to which, since the paralyzation of the mining-stock system of robberies, people generally have devoted their time, energies, and means to legitimate pursuits, and have made money. Instead of sinking their earnings in the bottomless pit of stock gambling, ninety out of every one hundred dollars put in being a clean loss to those silly enough to risk their means in stock ventures, the surpluses of earnings over current expenses have been placed in banking institutions, until the accumulation of coin in the bank vaults has reduced the interest upon deposits to so small a figure that the purchase and improvement of real estate is deemed far more profitable; and in hundreds of cases people of moderate means, who have kept themselves poor to feed the stock fiend, have recovered from the mad folly of overreaching to acquire rapid wealth, and have adopted the wiser course of taking care of their means, and investing safely in building improvements. Beside which, there are but few who cannot now afford to live better, and occupy more commodious houses, than they could three years ago.

Under the existing state of things, the fact is well assured, that any reasonable number of dwellings erected during 1883 will be readily rented, and at rentals paying satisfactory interest upon moneys invested in the improvements. We have systematically rebuked the wild and unsustained "boom" statements of the daily press, and shall continue to do so whenever they are made, believing that the truthful presentation of actual conditions will serve a better and more healthful purpose, and be more appreciated by our readers and the public generally.

Being the only journal devoted to architectural and building matters upon the Pacific coast, and our reports being always as nearly correct and reliable as it is possible to make them, with the uncertainties surrounding the gathering of information upon building matters, making due allowance for the misrepresentations sometimes designedly or otherwise imposed upon us, and typographical errors, which seems almost unavoidable, we ask our fellow-citizens whether we are not entitled to their individual support, without distinction as to profession, business, or avocation.

In one of the decisions rendered by the Supreme Court of Winsconsin recently, a point of interest to builders was brought out, showing the necessity of carefully preparing a contract. The builder upon demanding his money was confronted by the owner, who claimed that he used rotten timber. The contract, however, had stipulated the fact that the decision of the architect as to the quality of the material should be final. The latter having approved the timber, the owner had to foot the bill.

A Misrepresentation of Building Operations in San Francisco for 1882.

In the December issue of this journal we gave a summary of the number and cost of buildings erected in San Francisco during the year 1882, showing the increase in number of buildings erected over 1881 to be 252, with an increase in outlay of only $105,489. This result and showing were based upon our monthly reports, in the making up of which all reasonable care had been exercised, and may be relied upon as approximately correct.

But, as has frequently been the case, the *Evening Bulletin*, in its issue of December 22nd, seven days later than our publication, preferred to set aside our statements, and gave its readers a rehash of "*Buildings in Progress*," which was and is both silly and untruthful. Our summary gave the total expenditures for the year to be $3,896,212, as against $3,790,723 for 1881, making the gain as above stated; while our contemporary, in the article referred to, says: "A rough computation places the excess in value at $2,000,000," a difference of just $1,894,511. The statement of the *Bulletin* was a decidedly "rough" deal on facts, and a little "rough" on the man who penned the article, as he furnishes in the same article the proof of his misstatement of "Buildings in Progress" as follows: "*Sugar Refinery at South San Francisco, etc., $1,500,000.*" *Facts:* This refinery building was reported in the May, 1881, number of this journal as in progress, and was one of the larger improvements of that year, with but little to be done in 1882, except its machinery work; so that it cannot in any sense be included in the progress movements of 1882, having been a factor in reports of 1881. But as our contemporary needed something to make up its $2,000,000 "rough computation," it selected the building in question at $1,500,000, regardless of the facts that by so doing it produced evidence sufficiently conclusive to expose its utter disregard of truthful statements, as every one familiar with the building interests of San Francisco knows that the refinery was built in 1881, and that to place it among the "Buildings in Progress" in December, 1882, was a terrible leap into the vortex of untruth.

"*South-east corner of Fifth and Mission, etc., —$200,000.*" *Facts:* At the corner designated, the old drug-store building of many years' standing still remains, and is occupied as a drug store. But on Mission, between Fifth and Mary Streets, west of Fifth Street, there is a block of buildings in progress for Mr. Donahue, which will cost not over $135,000. The contracts figure up at less than $125,000.

Various other buildings heretofore duly reported in this journal are then itemized, ending the list with—"*Larkin near O'Farrell Street. Modest frame building. Cost $2,500.*" *Facts:* No such structure within sight of the corner named. There is one on the lot forming the south-west intersection of Larkin and O'Farrell, owned by G. G. Burnett, Esq., Wolfe & Son, Architects, which will cost about $10,000. Also one on Larkin, one and one-half blocks north of O'Farrell Street, costing $9,500. But none in the vicinity mentioned, costing $2,500. It is unnecessary to criticise further, the above showing sufficiently clear the unreliableness of the *Bulletin's* "Buildings in Progress" article, and removing the pins from under the "rough computation" of $2,000,000. Brother Fitch and his adjutants would do well to accept the

reports of this journal, both monthly (which it has done sometimes without giving us credit) and our yearly summary of Building Intelligence.

Holiday Slaughter of Trees.

At Christmas time even the humblest have their few pennies to spend in buying a Christmas tree. Churches are decked with evergreens; the fronts of stores are literally hidden by the large quantities of young trees before them; in nearly every dwelling, one or more of the young saplings may be found; and to furnish the immense number of wreathes and garlands required for ornamenting windows, etc., many of the infants of the forest are annually cut. The markets in San Fransisco are principally supplied from the region around Guerneville, Sonoma County. How many have ever thought that this immense drain, year after year, will ultimately cause a large vacant space in the forests that by right ought to be filled with young trees? We hope that the Legislature now in session will pass a law forbidding the cutting of young trees for ornamental purposes. The *Northwestern Lumberman* has the following upon this subject:

"The spruce and fir forests of Maine are now suffering extensive inroads to supply Christmas trees and evergreen for the holidays. The business is particularly heavy along the line of the Knox & Lincoln road, having grown to an important extent year by year. The trees leave the State at the rate of many car loads a day while the holiday traffic lasts, and, as everybody knows, are used in a variety of ways for trimming stores, churches, public places, homes, etc., before the conventional Christmas eve arrives. The State of Maine is a main source of supply, though evergreen is obtained from various sections of the country. The supplies have been so drawn upon that the forests are showing it, and the sacrafice continues, and will so long as people cry for luxury, and handlers can coin money, as many do at present. If 100,000 young trees were swept away yearly, even in Maine alone, it would be only the conservative and sensible ones who would lament. The merry-makers rarely reflect that they are denuding more of nature's tree store for one item of general enjoyment than all the forestry societies in the country could replace in years. Warren is one of the great distributing points in Maine for the sale of evergreens for Christmas, and scattered through the State are several firms doing an immense business."

Articled Architectural Students.

One of the objects of San Francisco Chapter of Architects is to establish classes for architectural students, to be conducted by gentlemen of recognized abilities in teaching the art of sketching, drawing, mathematics, geometry, modeling, carving, etc.

All articled students engaged in the offices of practicing architects, members of the Chapter, may avail themselves of the advantages of the classes, without cost or charges of any kind, except that those who desire to unite with the Chapter as student members have an opportunity to do so at the nominal changes established by the By-Laws. This, however, is optional with students.

The term *Articled Students* is intended to include those only who are under written contract or agreement to serve a term of years in the offices where engaged. Lads and young men who are under no such engagements may, by entering into written agreements with their employers, become entitled to the privileges offered in this connection. All such are requested to hand their name to the Secretary of the Chapter, George H. Wolfe, without delay, so as to expedite the formation of classes.

San Francisco Chapter, A. I. A.

The regular montly meeting of this Chapter was held on Friday evening, January 5th, 1883, President John Wright presiding. Minutes of the preceding meeting were adopted as read.

The committee on Articled Students presented a full report; the report was ordered to be printed in the form of a circular, that endeavors may be made to carry out the ideas suggested.

The committee on incorporating the Chapter was granted further time.

A communication was received from H. Saxon Snell of London, England, presenting the Chapter with a volume of his work entitled, "Charitable and Parochial Establishments." On motion, the same was received, and the Secretary instructed to thank the donor.

G. H. Wolfe was appointed Librarian for the remainder of this year.

On motion, a committee of three were appointed to draft laws in reference to the underpinning of buildings. Committe appointed, J. E. Wolfe, Macy, and Babson. The President was added to the committee.

Small Bed-Chambers.

There is reason to believe that more cases of dangerous and fatal disease are gradually engendered annually by the habit of sleeping in small, unventilated rooms than have occurred from a cholera atmosphere during any year since it made its appearance in this country. Very many persons sleep in eight-by-ten rooms, that is, in rooms the length and breadth of which multiplied together, and this multiplied again by ten for the height of the chamber, would make just eight hundred cubic feet, while the cubic space for each bed, according to the English apportionment for hospitals, is twenty-one hundred feet. But more, in order "to give the air of a room the highest degree of freshness," the French hospitals contract for a complete renewal of the air of a room every hour, while the English assert that double the amount, or over four thousand feet an hour, is required. Four thousand feet of air every hour! and yet there are multitudes in the city of New York who sleep with closed doors and windows in rooms which do not contain a thousand cubic feet of space, and that thousand feet is to last all night, at least eight hours, except such scanty supplies as may be obtained of any fresh air that may insinuate itself through little crevices by door or window, not an eighth of an inch in thickness. But when it is known that in many cases a man and wife and infant sleep habitually in thousand-feet rooms, it is no marvel that multitudes perish prematurely in cities; no wonder that infant children wilt away like flowers without water, and that five thousand of them are to die in the city of New York alone during the hundred days that shall include the fifteenth of July, eighteen hundred and

Another fact is suggestive, that among the fifty thousand persons who sleep nightly in the lodging-houses of London, expressly arranged on the improved principles of space and ventilation already referred to, it has been proven that not one single case of fever has been engendered in two years! Let every intelligent reader improve the teachings of this article without an hour's delay.—*The Builder.*

"Hose Drainage and Sanitary Plumbing."

This is the title of a neat little handbook of 205 pages, edited by Mr. Paul Gerhard, and published by D. Van Nortram, N. Y., containing many valuable suggestions upon the subject-matter indicated by its title. Every architect, plumber, and owner should possess a copy. Price, 50 cents; to be had at the office of this journal. Owing to the crowded state of our columns, we delay criticism till next issue.

EXTRA INDUCEMENTS

TO

SUBSCRIBERS FOR 1883,

TO THE

California Architect and Building News.

We will send either of the following journals for one year in connection with the CALIFORNIA ARCHITECT for the amount opposite their names:

	Price of paper alone for one year.	Price of paper and CAL. ARCH. and B. N.
American Architect (weekly Ed.)	$6.00	$7.00
" " (monthly Ed.)	2.00	3.50
Carpentry and Building	1.00	2.50
Builder and Wood Worker	1.00	2.50
American Artisan	1.00	2.50
Brick, Tile and Metal Review	.50	2.25
Carpenters' Journal	.50	2.25
Building	1.00	2.50
North-Western Lumberman	4.00	5.00
Scientific American	3.20	4.50
" " Supplement	5.00	6.00
Scientific American and Sup.	7.00	8.00
Leffel's Mechanical News	1.00	2.50

Select any one of the following list of books, forward us the amount, and we will send you the book, together with the CALIFORNIA ARCHITECT AND BUILDING NEWS for one year:

	Price of Book alone.	With CAL. ARCH. and B. N.
Steel Square Problems	$ 0.50	$2.15
Steel Square and its Uses	.75	2.25
Builders' Price Book and Estimators' Guide	2.00	3.50
Palliser's Useful Details	2.00	3.25
American Cottage Homes	3.00	4.25
Modern Architectural Designs and Details	10.00	11.00
Detail Cottage and Constructive Architecture	10.00	11.00
Village and Country Homes	5.00	6.00
Science of Carpentry	5.00	5.50
Plasterers' Manual	.75	2.25
Artistic Homes	3.50	5.00
Interiors and Interior Details	7.50	8.50
Practical Lessons in Architectural Drawing	2.50	4.00
Gould's Carpentry	2.50	4.00
American Stair Builder	3.00	4.25
Modern House Carpenter's Companion	1.25	3.00
Art of Saw Filing	.75	2.25
Grimshaw on Saws	4.00	5.00
Carpenters' Pocket-Book	1.00	2.50
Foundations and Foundation Walls	1.50	3.00
Ames' Alphabets	1.50	3.00
Old Homes made New	1.50	3.00
Francke's Monuments and Tombstones	9.00	10.00
Wither's Church Architecture	10.00	11.00
Sewer Gas and its Dangers	1.25	2.75
Workshop Companion	.35	2.10
Reed's Houses for Everybody	1.50	3.00

Any one sending us the names of three new subscribers, with $6, will receive a copy of the CALIFORNIA ARCHITECT AND BUILDING NEWS free.

Any one sending us the names of ten new subscribers, with $20, will receive a copy of the CALIFORNIA ARCHITECT AND BUILDING NEWS free, and $5 worth of books selected from the above list.

A club of twenty-five new subscribers entitles the sender to a copy of the CALIFORNIA ARCHITECT AND BUILDING NEWS, and $20 worth of books selected from the above list.

Uses of the Steel Square.

The mechanic's success as a *foreman* depends greatly on his ability to keep the men employed under him busy all the time; not a minute must be allowed for men to wonder what is next to be done, and so that no delay may be made in the raising of the frame of the barn, it is necessary that men be set to work framing the various timbers required, while part of the gang are completing the foundations. The rafters being the part, for young men, the most difficult to frame, we will see how they are being prepared. The building is 40x60 feet. Size of rafters 2x6 inches. Roof ¼ pitch. The length being the first thing required, we will find it by several different ways, and see if they agree. First, the old way of obtaining the length of the hypotenuse of a right-angled triangle, two sides being given. In this case the two sides would be 20 and 10. Squaring 20 and 10 and adding the products together gives 500, the square root of which is 22.36 or 22 feet 4.32 inches—22 feet 4⅜ inches. This is as near correct as is practical.

Or, let one inch on the square represent one foot. Then 10 inches on the tongue of the square and 20 inches on the blade will represent the two dimensions as above. Then place the point of your rule on the figure 20 on the blade of the square, allowing it to cross the tongue at the figure 10. You will notice that the length is 22⅜ inches scant, or allowing one foot to the inch, 22 feet 4⅜, the same as the previous method. This is the quickest and most practical way of getting the length of the rafters; by using a smaller scale as ½ inch to the foot, ¼ inch to the foot, etc., you can easily get the length of rafter for any width of building.

A scale of 1½ inches to the foot will also be found to be very convenient, as each ½th of an inch on the square will represent one inch on the rafter.

Still another way is by means of a "*fence.*" We well remember when we were first shown this way of getting lengths of rafters and braces. Hodgson, in his work on the square, has fully described the process. As we used the "*fence*" long before his work appeared in print, we may be pardoned if our language partakes somewhat of the character of that author's writing. Our "*fence*" was made somewhat different from those in general use. One day, while sauntering around the foundry at Santa Rosa, we came across two pieces of iron three feet long, 1½ inches wide, and ⅜ of an inch thick. A row of holes ¼ inch diameter, and spaced one inch apart, went directly through the center of the two pieces from end to end. My companion suggested that they were just the thing for making a "*fence.*" The owner kindly gave us the two pieces, provided we would let him see the "*fence*" after it was made. A strip of wood 10 inches long, just the thickness of a common square, was procured, and fastened between the two iron pieces, so as to be in the middle. The holes gave us the means of securing the piece of wood. The square was then inserted in the openings caused by the wood, so that the tongue was one side and the blade on the other, a small bolt, with a thread for a nut on one end, was placed in one of the holes near each end of the square, and the nut put in so as to draw the two pieces of iron together, thus firmly securing the square. That was the kind of "*fence*" we first saw used. It was, however, too heavy to be carried around in a tool chest, and after a short time it was discarded. A much handier and lighter one can easily be made from wood, using screws to draw it together to hold the square.

Now let us apply our "*fence.*" Select a straight piece of timber for a pattern. The roof is to be ¼ pitch; so place the square that the figures 12 on the blade, and 6 on the tongue are directly even with the top edge of your "*fence.*" The two sides of the square and the edge of the fence will form a right-angle triangle, bearing the same proportions precisely as the triangle formed by half the width of the building, the height of the roof and the rafter. Now if the same proportions are found in one of such measurements, twenty times (or ½ the width of the building), those figures would give us the exact length of the rafter.

Commence at one end of the piece you have selected for the pattern, and lay your fence against its edge. With a sharp-pointed *awl* mark on the pattern the exact shape of the square that is exposed outside of the fence, the long bevel of the square being towards the heel of the rafter. Then move the fence along, placing it so the long bevel will commence again precisely at the point of the short bevel, opposite the right angle of the square. Mark again as before; do this twenty times; the last mark will be the upper-end cut of the rafter, and will show its exact length.

If the roof is ½ pitch, take 12 on the blade and 8 on the tongue; if ½ pitch, then 12 on blade and 12 on tongue. A general rule to be used, and one easily to be remembered, to mark the bevels for any pitch of roof, is to place the 12-inch mark on the blade even with the top edge of your *fence*, and that mark on tongue that corresponds with the rise of the roof in feet even with the same edge, you will then have the exact angle for the rafter of one foot in length. Proceed as above. Thus, if the roof has 5 inches to the foot, place square at 12 and 5. If 11 inches, then at 12 and 11, and so on.

When the length of the rafter is equal to the width of the building, the pitch of the roof so formed is known as the GOTHIC.

Several precautions must be observed in using a *fence*. See that the fence is held firmly against the edge of the pattern, and that the figures used are precisely even with the edge of the fence. A *scratch awl* sharply pointed should be used, and the aim should be to use exact measurements.

The way we have described is to be used when no projection of rafter is required. In the case the latter is necessary, gauge a line the width of the required projection the full length of the pattern. *Gauge always from the crowning edge.* Then proceed as before, using the gauge line instead of the edge of the pattern.

If a ridge board is used, deduct ½ of its thickness from the length of the rafter, measuring the distance square from the end of the upper bevel.

If there is a fraction of a foot, proceed as follows: If the roof is quarter pitch, and there is a fraction of say 8 inches, place the square with the 4-inch mark on the blade, and the 2-inch mark on the tongue, in the same manner precisely as before, and the distance between these points will be the extra length necessary. No matter what the pitch may be, the same rule will apply.

We have just received two new works which should be in the possession of every mechanic:

THE MODERN HOUSE COMPANION AND BUILDER'S GUIDE. Price, $1.25.

THE BUILDER'S GUIDE AND ESTIMATOR'S PRICE BOOK. Price, $2.00.

Each one written by a *practical* man, and well worth the price.

SCIENCE OF CARPENTRY MADE EASY. Price, $5.00.

Or, by special arrangements with the author, we are able to send one year's numbers of the CALIFORNIA ARCHITECT AND BUILDING NEWS together with the above work for

$5.50.

This series of articles on the square was commenced in the September number, 1881. Back numbers can be supplied at 20 cents each.

Something about the Saw.

Few people know the meaning of the figures which are stamped upon the heel of the hand-saw. Experts doubtless imagine it is to represent the number of teeth to the inch. However, this is not correct, for the figure is always one more than there is teeth to the inch. For instance, if a saw is marked "9," there will be just one tooth for each one-eighth of an inch. Consequently there will be only eight teeth to the inch.

Perhaps the best saw-set is a good vise; a vise that has straight and smooth jaws; jaws that will pinch thin paper their entire length.

By placing the saw in such a vise as this, with not more than one-half of the tooth projecting above the jaw, and using a nice punch and suitable-sized hammer, the saw can be set better, perhaps, than with any other saw-set ever invented. Of course, a *wide* saw cannot be set in a common-sized vise; but *wide* hand-saws or any other kind of wide saws do not work as well as *narrow* ones. A saw should only be of sufficient width to give it strength and stiffness, and *all* saws should be thinner on the back than on the edge. There is no economy in using a poor saw.

In filing "cut-off" hand-saws, *always* point the file *upward*, and towards the *point* of the saw. The more the file is inclined upward and *forward*, the better the saw will cut, provided the saw is filed by an expert. It must be borne in mind, that the more the file is inclined the more difficult is the filing.

"Rip saws" should be filed exactly the reverse of a "cut-off" saw, only the *less* inclination the better. A rip saw will do good work filed *straight across*, and is very much less work to keep it in running order.

Rip circular saws, as well as *cut-off* circular saws, should have a fly-wheel when they can be used without being in the way; and when saws of different sizes are used on the same shaft, there should be pulleys of different sizes that could be changed in an instant. As the verge of all saws require the same speed(?), which is, perhaps, about from 7,000 to 9,000 feet per minute, if the power is limited, 7,000 feet per minute will do very well.

Saw tables should be made to raise or lower in an instant to any desired point, not only for sawing rabbets, grooves, etc., but to place the table so the saw will just reach through the lumber. It requires only about one-half of the power to saw inch lumber with a 12 or 14 inch saw when the table is raised so the saw will only reach through the lumber than with the same saw when the table is down to its lowest. The saving of power is not the only advantage in having the saw just reach through the lumber, for lumber can be sawed much straighter, and far less liable to heat the saw.

SOMETHING ABOUT THE FENCE.

It is always better to have the *fence* the whole length of the table, but there should be an offset from the center of the saw to the farther end of the fence of not less than an eighth of an inch. There should also be a "relieving lever," to throw the fence *out of line*; as in case there is to be *fine* sawing done of thin pieces, for instance, strips for lattice work, where a good many pieces are to be sawed from one piece of plank. In this case the fence should be thrown *out of line* so that the lumber will *hug* the fence, and saw each piece exactly the same thickness. But if rough sawing is to be done, the lever must be reversed, and the fence thrown out of line in the opposite direction, so that the lumber will pass along freely without binding between the saw and fence.

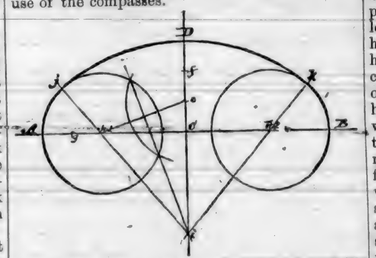
Rollers that are put on springs to press the lumber to the fence should have a slight inclination *forward*, which will make them have a tendency to *climb* the lumber, and keep it firm upon the table.

A *cutting-off* saw, either hand, band, or circular, should never be used in sawing obliquely across the grain, of more than 25 or 30°. All *miters* should be sawed with a *rip saw*, either by hand or with power. A common-sized tooth circular *rip saw*, if properly filed and set, will make better miter joints than any *cutting-off saw* that ever was hung.

E. H. DAVIES.

Santa Clara.

We promised a correspondent to illustrate in this issue how an ellipse could be made by the use of the compasses.



Draw any line. Mark any two points as A B. Bisect the line between the points by perpendicular C, D, L. The distance C D is to be one-half the width of the required ellipse. Divide C D into 3 equal parts. Measure off from A and B the length of 2 of these parts as points, *h* and *z*. Join *h* and *e*. Bisect line *g e*, and continue the line until it intersects with the line D C L. At L is the center from which to describe the sides of the ellipse, and the points *h* and *z* are the centers from which to describe the ends.

To BEND A GOOSENECK.—Fill the lead pipe full of sand, ram it in well, and plug up both ends, bend it carefully over your knee or around a barrel.

To A. L., of Healdsburg: A good thing to use in patching small scars in plastering is plaster of Paris mixed with common flour paste. If the plaster is mixed with water it sets almost instantly; but when mixed with paste, it sets quite slowly, giving time to use it as may be desired.

A flour barrel is 28 to 30 inches high, and 20 or 21 inches in diameter at the largest part. This note may be of use in fitting up closets and pantries.

Mr. F. A. Rollo Russell, an English sanitary engineer, has come to the conclusion that the upper parts of buildings are by far the most healthy, and that even second stories possess decided advantages over ground floors. He finds that the climate undergoes less variation on hills and on the tops of lofty buildings, being cooler in the summer and warmer in the winter than on the surface of the earth. It has been observed that frost strikes the valleys first, and that in cold weather the thermometer on the hill-tops does not fall as low as in the valleys.

The Man-hole Scare.

The outcry against the system of open ventilation of the public sewers into the center of the carriage-ways, lately raised, has had a powerful effect in alarming the minds of the general public, whose confidence in such matters is based on the opinions of experts. Its example has caused medical officers of health to be so bold in their statements concerning the evils arising from the gases escaping from the man-holes, that the average member of the community half believes that the sewerage systems of our best towns, instead of being the means of carring disease away from our homes, are actually the carriers of it to our very doors.

The Medical Officer of Health for the parish of Chiswick startled his Board a few weeks ago by stating that he knew of no other cause for a case of enterie fever in the parish than the exhalations from the man-hole ventilator in the street where it occurred. The Board promptly ordered an inquiry into the case, with a view to knowing if their sewerage system, just completed at a cost of nearly 80,000*l.*, was really a means of distributing disease and perhaps death. Dr. Corfield, Professor of Hygiene in University College, was called in, and has presented his report on the case. The man-hole ventilator alleged to be the cause was about 40 ft. from the house in which the case occurred. Inside the house he found that the scullery sink-stone was connected directly to the sewer, and that the only protection from the inrush of gas into the house from it was a small bell-trap with a water-seal of at most ½ in. When he removed the top of the trap, and held a lighted wax match over the mouth, the indraught was sufficiently powerful to cause the flame to flicker violently. He further found that the water service was intermittent, and that one cistern alone supplied the water-closet and the taps inside the house. He stated that, in his opinion, the disease was more probably caused by the sanitary defects inside the house than by the exhalations from the man-hole. In this moderate opinion, experts will join. In such a case comment is needless. We will only venture to say that it raises in the mind an uneasy suspicion that medical men look upon the man-holes as a cause to which they can refer every case presenting a difficulty of explanation, or in which they are too careless to make diligent search for the real cause.—*Ex.*

Specimens of Letters Received.

SEBASTOPOL, SONOMA CO., Dec. 14th, 1882.

Dear Sir—I wish to make my husband a Christmas present, and, as he has expressed a wish for the "*Science of Carpentry*," I cannot give him anything that will be more acceptable; so please send it as soon as you can, together with your excellent journal for 1883. I send you $6 by express to-day. MRS. ——.

We received a gratifying number of similar missives during the holidays, from the wives and mothers of mechanics, and we hope to win the kind consideration of thousands more.

RIVERSIDE, SAN BERNARDINO CO., CAL., December 18th, 1882.

Dear Sir—Supplement No. 1 noted and appreciated, more especially the enterprise prompting same. Accompanying find $2, in consideration of which please send the ARCHITECT AND BUILDING NEWS to S. & S.

We might add hundreds more of similar import from all parts of the Pacific coast and the Eastern States, but give the above as sufficient to illustrate the rapidly increasing interest felt in this journal. Let the good work go on, until every mechanic and owner of real estate in the land shall have his name entered upon our subscription list.

PLATE 1.—ELEVATION OF A COMMODIOUS DWELLING COSTING $10,000.

A Proud Record.

PERMANENT ADS.

The success of a journal of this description depends greatly on the character of its advertisments; and when business men continue to to keep their wares before the public by a judicious use of printers' ink, it follows that the parties inserting the "ads" are being greatly benefited. We present below a list of the firms who have advertised continuously with us since the first issue of this journal, in 1879.

Weed & Kingwell, California Brass Works.
Bigelow & Morris, Western Iron Works.
F. H. Rosenbaum & Co., plate-glass, etc.
Turner, Kennedy & Shaw, lumber dealers.
J. Kemp & Co., turning, sawing, carving, etc.
Whittier & Fuller, Pioneer Lead Works.
W. W. Montague & Co., mantles, tiles, etc.
Pacific Rolling Mills.
J. R. Sims & Son, iron doors, girders, etc.
J. Mallon, Pacific Glass Works.
W. Holst, Glass Works.
Commercial Insurance Company.
Lucas & Co., Golden Gate Plaster.
Kellett & McMurray, plaster decorations.
Renton, Holmes & Co., lumber dealers.
J. Marquis, standard hoppers.
C. H. & G. W. Burr, premium hoppers and weather strips.
W. E. Stevens, patent chimneys.
J. Browell, patent chimneys.
Spaulding & Co., Pacific Saw Works.
Dunham, Carrigan & Co., bronze, hardware, iron, steel, and mechanics' tools generally.

In addition to the above, the principal plumbers in the city have kept their cards in permanently.

The plasterers have been well represented, as a glance at their column will show.

The carpenters have done nobly in sustaining their part of the good work in supporting a home journal. Many of them have been greatly benefited by their "ads," as we know of parties in the country who have obtained help through the aid of those advertising.

The principal stair builders in the city have the satisfaction of knowing that their business has been increased by keeping their cards in the proper place.

In fact, brick layers, masons, metal roofers, asphaltum workers, etc., all testify to the great value of this journal as an advertising medium.

We sincerely thank our brother professionals for their cordial indorsement of the CALIFORNIA ARCHITECT, and their generous support, as shown by the large number of business cards.

Trusting that the future course of this journal will be such as to give entire satisfaction to those who have so worthily enabled us to build it up to its present standard, we present this initial number of a new volume with its many improvements to our readers, promising them that it will be our aim to make still further changes for the better in each successive issue until we can boast that we have no superior in all the broad range of journalism.

THE ARTIST'S ALBUM.

A large work, beautifully illustrated; will be forwarded to any address, upon receipt of price—$8.00.

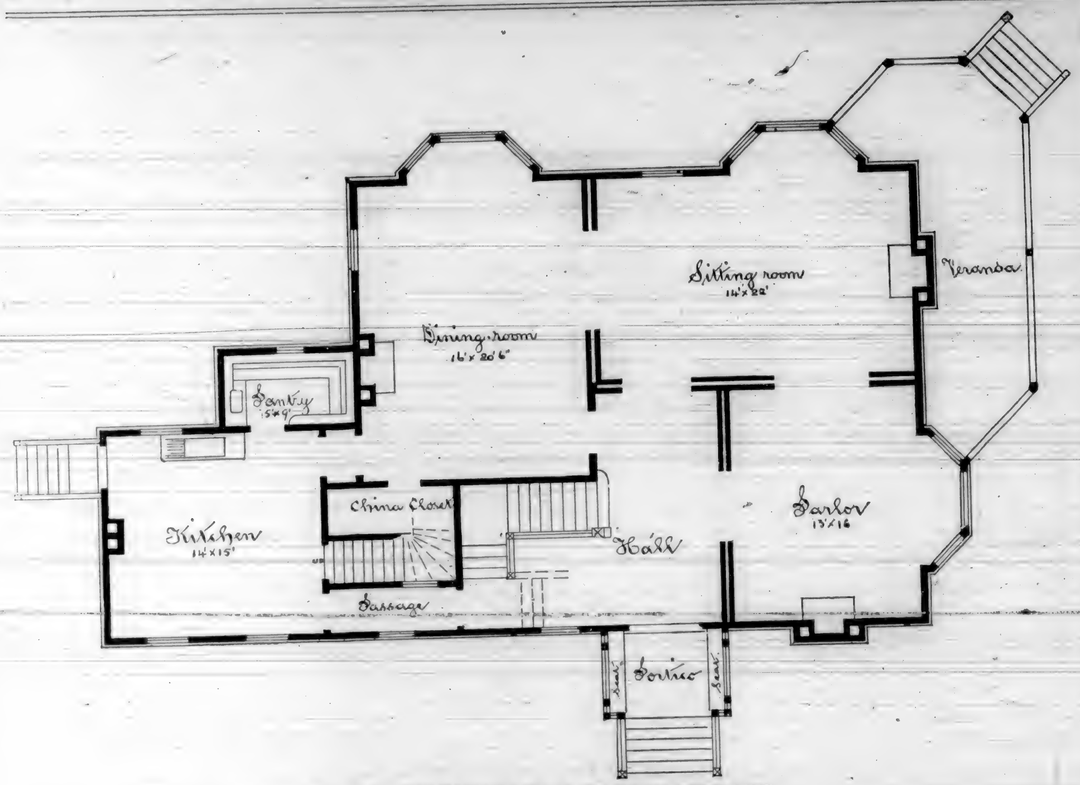


PLATE 2.—FIRST STORY PLAN OF $10,000 DWELLING.

Some Facts About Bricks.

An average day's work for a bricklayer is 1,500 bricks on outside and inside walls; on facings and angles and finishing around wood or stone work, not more than half of this number can be laid. To find the number of bricks in a wall, first determine the number of square feet of surface, and then multiply by 7 for a 4-inch wall, by 14 for an 8-inch wall, by 21 for a 12-inch wall and by 28 for a 16-inch wall. For staining bricks red, melt one ounce of glue in one gallon of water; add a piece of alum the size of an egg, then one-half pound of Venetian red, and one pound of Spanish brown. Try the color on the bricks before using, and change to light or dark with the red or brown, using a yellow mineral for buff. For coloring black, heat asphaltum to a fluid state, and moderately heat true surface bricks and dip them. Or make a hot mixtute of linseed oil and asphalt; heat the bricks and dip them. Tar and asphalt are also used for the same purpose. It is important that the bricks be sufficiently hot, and be held in the mixture to absorb the color to the depth of one-sixteenth of an inch. —*Railroad Journal.*

Hotel Plumbers.

Our attention was called to the following advertisement in a daily paper:

"A situation wanted by a young man as porter; understands plumbing and gas-fitting; a handy man around hotel, or as watchman."

It is just such handy men that in attempting to do plumbing sometimes cause a great deal of trouble. If this advertiser was a good plumber he could earn from three to three and a half dollars a day. A porter's wagers are about two dollars; the advertisement, therefore, implies that he is a better porter than plumber.

The average hotel plumber is a dangerous man to have around, and if the registration provisions of the plumbing law were strictly enforced in this city, these men would be prevented from tampering with work that none but a skilled plumber should touch. If the plumbing societies want to perform a real service they should appoint a first-class committee, which should make it its business to look after men not registered, and see that the law is carried out. The medical societies are constantly hunting out the frauds and quacks, and they are vigilant in seeing that the law for such cases is enforced. This is what reputable plumbers should do.—*Sanitary Engineer.*

Substitutes for Lumber.

While on the one hand numerous practical men are setting forth the imminent danger of total exhaustion of the available timber supply of this country in the not very distant future, and are energetically striving to establish a correct public sentiment as to preserving and planting trees, on the other hand inventors appear to be bending their energies toward making wood entirely unnecessary for building, manufacturing, or fuel, or indeed for any purpose whatever. When the possibility of making lumber out of straw, which should fill the place of that obtained by "slaying the monarchs of the wood," was first suggested, many were disposed to regard it as a canard, pure and simple, or at best, nothing more than an impracticable idea. To-day this is an accomplished fact. Not only this, but other materials are rapidly supplanting lumber in all directions. Wire is taking its place in fences; metal, slate, and felt are employed for roofing; machinery is constructed more of metal and less of wood, and wire laths, iron posts, joists, beams, and ceilings are coming into more general use. Among the latest inventions is a glass veneer, which, it is said, can be made in so close imitation of the ornamental woods as to defy the closest inspection. With the discovery that the glass can be so made as to lose its customary fragility, is revived the suggestion of the entire feasibility—even advisability—of constructing houses entirely from glass. All these facts indicate that when the predicted lumber famine comes, it will not affect building and manufacturing interests so seriously as one might suppose. Still, we should hardly advise the proprietors of saw and planing mills, and wood-working establishments in general, to make immediate preparations for changing their business. There is plenty of good timber in this country, and neither this generation nor the next will see it entirely supplanted by any of the would-be substitutes.—*The Lumber World.*

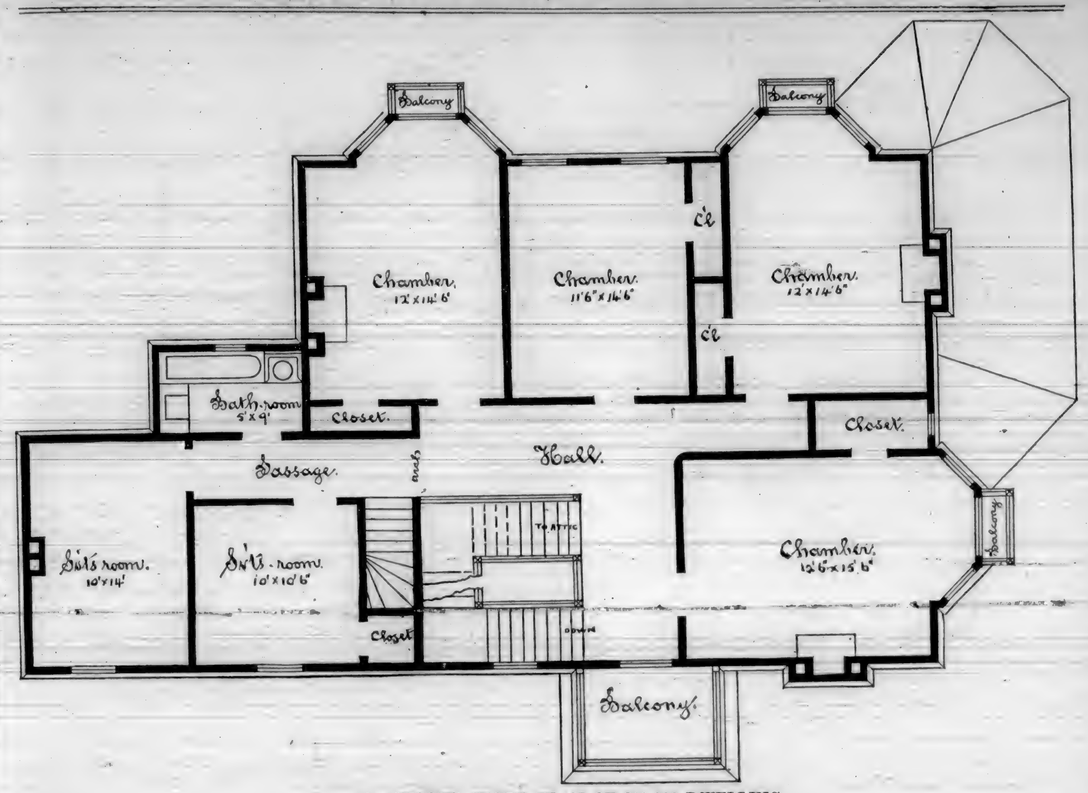

PLATE 3.—SECOND STORY PLAN OF $10,000 DWELLING.

The Snow-Storm of New-Year's Eve, and its Effect upon Shingled Roofs.

We know of nothing that has happened in San Francisco within the past thirty-two years which caused such general excitement of a pleasing character as the mantle of snow which fell on the 31st of December, 1882. The day was ushered in with a low degree of temperture, and the remark, "It feels like snow," was expressed by thousands, yet perhaps but few anticipated that a snow-storm was really nigh at hand.

The usual number of worshipers wended their way to the various churches, prepared with mantles and wraps for the "cold snap" only, not anticipating the necessity for umbrellas on their return home; consequently, when the respective congregations were dismissed, there was great excitement at anticipated damages to fine dresses and Sunday outfits, mingled with laughter and delight at the sight of the falling snow-flakes, as they fell in rapid succession, until the white covering from the clouds spread itself over everthing not under cover, to the depth of several inches. Conjecture places the total fall at from three to six inches—four to five probably being nearer the exact quantity; but as the ground was moistened by the dews and damps of preceeding days, and remaining unfrozen, a large proportion of the snow melted away before the snowing ceased. To persons accustomed to the usual snow-falls of winter, in the mountains of California and other sections of the Pacific coast, and places where each returning season brings its regular snow-storms, that under notice possessed less interest; but the thousands of children and young people who had never witnessed a fall of snow, and the older portions of the community who have but twice before within the history of California as a State seen the "ground covered," became jubilant, and snowballing was the order of the day. At every corner along the promiment streets of the city, crowds of boys, young men, and older heads gathered to indulge in the sport of pelting passers-by, without respect to age or sex; while the drivers and conductors of cars, and those who held the reins in milk-wagons, hacks, and vehicles generally, became targets at every crossing of streets—the poor Chinaman receiving very special attention wherever he dared to venture beyond the threshold of his abode.

HOW ROOFS OF HOUSES WERE AFFECTED.

In the construction of roofs in San Francisco the only consideration has heretofore been to make them secure from leaks during rainstorms—snow being one of the overlooked possibilities. But the snow of New-Year's eve demonstrates that should snow fall to the depth of twelve inches, more or less, great damage would result, particularly to the class of dwellings where the roofs pitch from center to sides of buildings with tin gutters along the side walls, emptying through conductors at the rear ends of the buildings. As a general thing, this class of gutters are badly constructed, being put in with just sufficient grade to discharge the water, one-quarter inch to the foot, sometimes less, and in thousands of cases not more than three or four inches fall in fifty feet. In our practice as architects, we have experienced great difficulty in enforcing a pitch of half-inch to each foot, contractors contending that any degree of slant will discharge water at the lower end, disregarding the material fact that the greater the pitch the more perfect will be the wash and durability of tin gutters, and less the liability of *debris* remaining in the waterways to absorb and retain the moisture from fogs, dews, and rains, and consequent corrosion and rust of the tin. Then again, the mean economy of restricting the width of the tin, so that the butts of the shingles lap but two or three inches over the edges of the metal, is a fruitful cause of leaks, and the fallacy of both flat and narrow gutters were fully demonstrated by the slight fall of snow of New-Year's eve; the snow filling the waterways, particularly where it was blown in drifts to an increased depth, and choking the small conductor outlets of two to four inches, thus preventing the escape of the rain which terminated the snow fall from running off; and, as a consequence in hundreds of cases, flooding up over edges of the gutters, and into the buildings. Thousands of tin pans, buckets, tubs, children's bath-tubs, etc., were brought into requistion, and some of our better circumstanced citizens were compelled to undergo muscular exercise in the manipulation of the water receivers, which produced soreness of limbs by no means pleasant, and blessing the reverse of piety fell from the lips of hundreds of angered heads of families.

Another suggestion is introduced in connection, to wit: 1882 ended with a snow fall of say five inches, with the above results. But as per-

PLATE 4.—PERSPECTIVE VIEW OF DWELLING COSTING $3,000.

Our Illustrations.

Having perfected arrangements by which drawings can be reproduced in a superior manner, we present in this issue numerous plates by far surpassing in execution those we have hitherto published. It has been our aim from the first inception of this journal to secure a better process for producing cuts from drawings than could be found in San Francisco. Acting upon this worthy motive, we have, in turn, tried many of the different processes used in various parts of the United States, and we leave it to our readers to judge of our success in the selection of the best. We do not intend to halt in our efforts, and trust that each succeeding number will show that our efforts are continually pointing towards advancement.

Plate 1, is the elevation of a very convenient house. Plainness and neatness are its principal characteristics. Plates 2 and 3 are the plans. It will be noticed that every part of the house is easily accessible from the front hall; even the kitchen is in direct communication, by the aid of a well-lighted passage-way; there are doors at each end of the passage, so that with proper care no smell from the kitchen can enter any other part of the house. By opening the sliding doors, the lower part of the house can be made into a grand promenade. The windows facing the veranda run down to the floor, so that an easy exit is obtained. The veranda can be used for a smoking-room, being placed on the side of the house away from the wind. The kitchen is large, well lighted, and easy of access from dining-room, hall, and yard.

The arrangement of the bedrooms, etc., in second story, cannot fail to meet the wants and taste of any one desiring comfort. They are all well lighted, of good size, and easy of access. The bath-room is placed where no danger need be feared from sewer-gas, and is handy to every room in the second story. Closets abound in every room save one, and in that, if needed, one could be placed in either of three corners. Stairs are shown to the attic, which can be laid off into several very comfortable rooms, if needed. From the attic a flight of stairs could be placed to a deck on the roof, from which a view of the country can be obtained. The cost of this plan—allowing San Francisco prices for everything—will be about $10,000. This figure can be changed either way, according to styles of finishes.

Plates 4 to 8, are the elevations and plans of a picturesque country house. A glance at the plans show at once the convenient arrangement of the rooms. Its cost will be in the neighborhood of $3,000.

haps one-half the quantity thawed during the prevelance of the storm, its average depth was at no time more than two to three inches. We ask, had the themometer ranged below zero, so that no thawing would have occurred, and the rains come as they did, to wet and add weight to the snow, would not some of the light constructions yielded to the unusual weight thrown upon them? Any number of roofs are constructed with rafters of 2x3 inch lumber, many of them without any collar beams or braces, and we doubt whether they would sustain the weight of six inches of wet snow. And we are very confident that if a fall of twelve inches should occur, there would be an extensive caving in of roofs in California. With the possibility of an old-fashioned snow fall before us, it will be well for architects and owners to see to it in the future that substantial roofs are placed on their buildings. The tin and composition and shingled hip-roofs were all right this time, but in cases of heavy snows, we question whether many of these would not suffer damage, for the reason that but few roofs are constructed on this coast for other purposes than simply strength to sustain them under ordinary conditions, with no provision for the contingency of heavy snows.

Beautifully bound, in morocco; but one copy remains. Price, $35.00.

Improvement in Chimneys.

The best chimneys are made by inclosing hard-baked glazed pipe in a thin wall of bricks. Such chimneys will not only draw better than those made in the usual way, but there will be less danger from "defective flues." A four-inch wall of bricks between us and destruction by fire is a frail barrier, especially if the work is carelessly done or the mortar has crumbled from the joints. To build the chimneys with double or eight-inch walls makes them very large, more expensive, and still not as good as when they contain the smooth round flues. To leave an air chamber between them for ventilating is better than to open directly into the smoke flue, because it will not impair the draught for the fire, and there will be no danger of a sooty odor in the room when the circulation happens to be downward, as it will be occasionally. The outside chimney, if there is one, should have an extra air chamber between the very outer wall and the back of the fireplace to save heat, a precaution that removes to a great extent the common objection to such chimneys. A very large per cent. of fires comes from defective chimneys.—*Scientific American.*

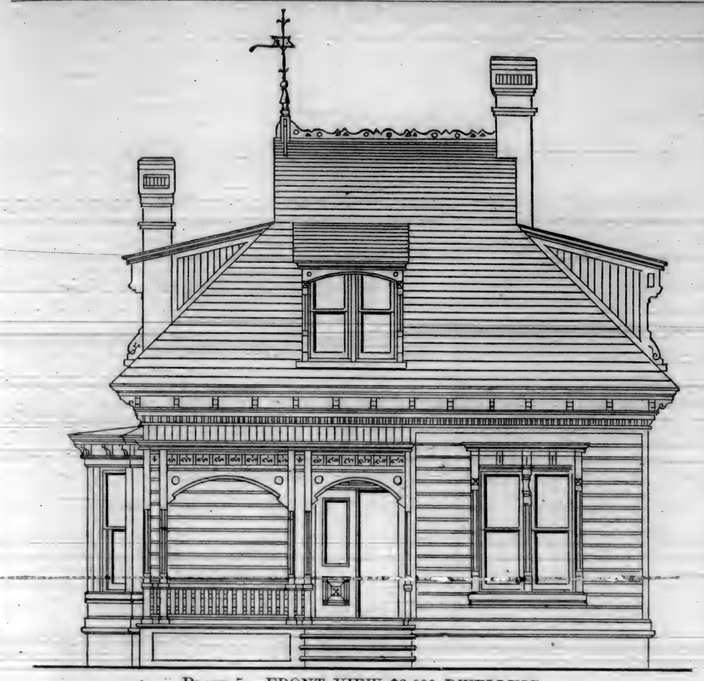

PLATE 5.—FRONT VIEW $3,000 DWELLING.

Credit to Whom Credit is Due.

"*Clippings*" from standard journals and publications are absolutely necessary for the success of modern *news distributors*. One will soon get weary of perusing articles by the same author in repeated successive issues of any paper. The use of the clipping shears is an accomplishment apparently easily obtained, but none know better than an editor who truly endeavors to give proper credit for every article clipped, the difficulty in selecting proper articles, and the care necessary to give credit to the proper authors. One of our most esteemed contemporaries announces that every article after January first will be copyrighted. The editors of the journal are compelled to take this step on account of the pilfering of its articles by another paper published in the same interest. We have frequently seen in the two journals articles so nearly alike that if it was not for the high standard and integrity of the parties publishing the *Northwestern Lumberman*, we would be in doubt which party to give credit to. We are pleased to see one of our most esteemed exchanges take the step it has in this matter; and in future there will be no excuse for an editor not giving proper credit to whom it is due.

We are greatly amused at an English journal having quite an article on this subject in its preface. We quietly looked over its pages, and among its articles was one entitled "Laziness." The editor must have had a superabundance of that well-known quality at the time he inserted the "*clipping*," as the article was an original one with the senior editor of this journal, and appeared in the January number, 1881, sometime before its publication in England.

Again: in our last issue we clipped an article and gave credit to the paper from which it was taken. After we received the proof, upon looking over later exchanges, we found precisely the same article in three of them, and what is peculiar, they were all original, because no credit was given in any of the journals to the original author. An editor stands a good chance to "get in a pickle," as it were, in such a case. It would be manifestly wrong to give credit to any particular paper. The editor, however, has the remedy in his own hands. Just mark "Ex" after the article, and that will at least show that it is the work of some man's brain besides the one that presents it to his readers.

In the future it will be our aim to give credit for every article published except those that are original with the editors of this journal. By so doing, our readers can readily see the immense amount of work necessary to produce a journal of the character of the CALIFORNIA ARCHITECT AND BUILDING NEWS.

Straw Lumber—Suggestion to Farmers.

A few months ago we inserted an article in regard to straw lumber. Several of our exchanges saw fit to copy, and the result has been that numerous inquiries have reached us in regard to the manufacture of lumber from straw. That lumber can be so made is an indisputable fact. It can be used for all the purposes of ordinary lumber and as easily worked.

A gentleman from the East has requested us to draw attention to the matter, and ask farmers and those interested to forward us information in regard to the given amount of straw that can easily be delivered at any certain point, and the price thereof.

Convenient water privileges will be the great desideratum. Mills that manufacture the lumber in general use only require the sawdust and waste slabs and edgings for fuel. But with straw lumber it is intended that there shall be but little waste, and additional sources of supply for fuel will have to be looked for in case of the establishment of the new mill. We shall be pleased to hear from our farmers in regard to the matter.

Index to Vols. 1–4.

All parties who desire a copy of this index should at once send to this office. We have had a large number printed, and in the confusion attending the distribution of so many, doubtless some will be overlooked. A postal directed to this office, will be answered by the immediate forwarding of a copy.

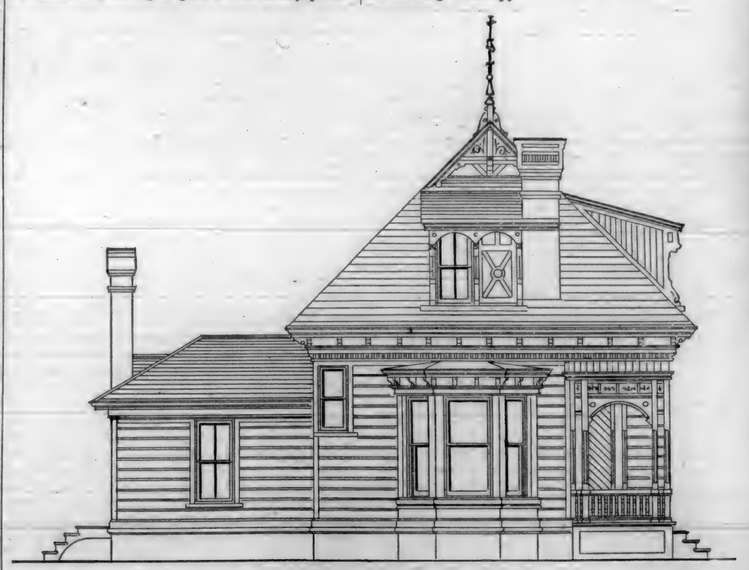

PLATE 6.—SIDE VIEW $3,000 DWELLING.

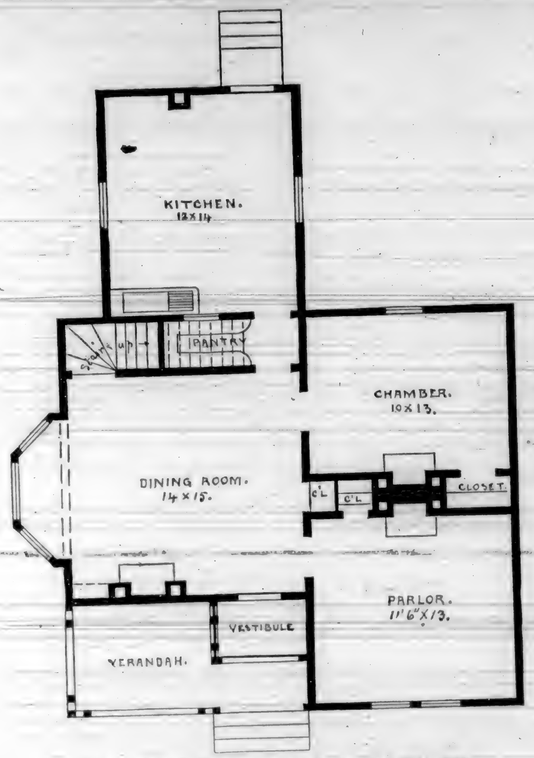

PLATE 7.—FIRST FLOOR PLAN $3,000 DWELLING.

Veterans' Home Competition Plans.

On December 20th, the gentlemen appointed to examine the plans for the "Veterans' Home" met for that purpose, and found to their dismay no more than three attempts by architects to meet the unreasonable requests of the committee having the matter in hand. The refusal of the leading architects of the city to countenance the effort of the committee to secure a large amount of other people's time and labor without offer of compensation, deserved the contempt placed upon it by the members of the profession, and leads us to hope that the influence of this journal will at least in time work a reformation in the matter of competitive plan making, which will correct the base and absurd notion that architects as a class are ready and willing at all times to jump at any proposition that may be made, to use up time, paper and ink, with professional services and studies thrown in, without offered compensation. It has always been a matter of surprise and annoyance to qualified members of the profession, that men of intelligence and business integrity and abilities should so far lose sight of every principle of right and justice as even to suggest, much less to seriously propose to intelligent architects, the making of plans in competition without accompanying the proposition with adequate and reasonable offers of remuneration. And we hope the time will arrive when not a single man who is worthy the name of an architect, and who has any regard for the standing and reputation of the profession, will do otherwise than scorn every attempt made by individuals, associations, committees, or commissions to procure plans for buildings of any character without proper and just recompense. The practice of obtaining plans upon the conditions offered in the case under notice, and many others of similar or worse character, has grown to be an injurious evil, amounting practically to this—the creation of a general idea that architects are a class of men whose time and professional skill possess but little value, and may be had upon the slightest inducements.

One thing is certain—that but few really qualified and competent architects will engage in these often-repeated, uncompensated, competitive contests, which are calculated in their effect to to demoralize and infringe the rules, principles, and practices which should govern and control in all cases, and create the sentiment in the public mind that the skill, experience, and services of architects have, in part at least, but circumstantial value, entitled only to such considerations as others may see fit to set upon them.

It is true that no one is compelled to enter into such contests; but that fact does not relieve the purposes and disposition of the parties making the proposal from the charge of seeking to obtain from others something which confessedly possesses value, without any assurance of payment for the services rendered. The fact that the successful party may secure compensation is but poor payment and satisfaction to those who may have earned equally as much by labors performed; and not unfrequently the intrinsically and practically more meritorious are set aside, while the lesser succeed through skillful manipulations of advantages and showings on paper which deceive the unpracticed eyes of the novices who generally control such matters. Some of the worst things perpetrated in the erection of buildings have been in connection with competition plans; and as a rule, numerous changes are made in the plans adopted, and more generally the cost in execution is greatly increased over original calculations. And the man who enters into a competitive contest upon the square basis of following the lines made by those inviting the competition, will find himself defeated in nine out of ten cases. To be successful, every possible art and device must be resorted to, and all cavilings upon points of honest representations quieted. We have carefully watched these competitive frauds, and have long since been convinced of their gross injustise, with scarce a redeeming case in mind. And further: we have facts at command to satisfactorily substantiate the fact that in many instances success has been the result of purchase or special personal favoritism. It is a broad assertion for us to make, but we make it intelligently, that the unimpreachable competitive transactions are exceedingly limited. Sometimes committees are innocently, on their part, led to accept and approve unskillfully prepared plans, which in cases augment a large increase in outlay, because those "behind the throne are greater than the throne itself"; and it is only as the work progresses that innocent committeemen discover and realize the mistake they have made. Nor is the objectionable features of such cases always attributed to the architects engaged in the contests, as there are but few cases in which unseen influences are not brought to bear for purposes by no means clearly apparent in the premises.

Our knowledge of the gentlemen having the "Home" matter in hand forbid the thought that they mean otherwise than exactly right; but the principle involved being absolutely wrong, less than wrong could not reasonably be expected in the consummation of the matter in hand.

Since preparing the foregoing for print, statements have appeared in the San Francisco *Chronicle* fully sustaining our position, and revealing the fact that the honorable committee have at least gathered about them a very disagreeable state of things, which might have been avoided by their selecting three competent and honorable architects to make plans, and giving to each fair pay for the services exacted; or rather selecting some *one* good architect, and allowing him singly to fulfill the requirements of the committee, as any member of the profession in San Francisco who has acquired by study and practice, an amount of architectural knowledge sufficient to entitle him to recognition as a qualified architect, could have accomplished all that was necessary in the case, and saved all the unpleasant issues which have grown out of an unrestricted invitation. Up to the present writing, Messrs. McDougall & Son's plans appear to be the more acceptable to the committee, and we have every confidence in the integrity and ability of the gentlemen named, and believe them to be as free from any intrigue in the matter as men can well be under such circumstances; but other of the contestants seem to measure the severity of their condemnation of the committee's act, by the depth of their disappointment, which seems to be without limit. The statements of the several gentlemen interviewed by the *Chronicle* reporter, questioning the results,—if the plans rejected had been approved, is perhaps justified; as under-valuation in such cases is the rule, and if a bond to complete according to said plans had been accepted, it would have amounted to nothing, as there are numerous methods of avoiding the responsibilities of bonds of that character. And the "shoddiness of constructions" would doubtless have occurred, as a necessity to personal, financial safety on the part of the proposed bonding architects, who to secure the adoption of their plans, named an amount scarce sufficient for the erection of the merest shells, and not within twenty per cent. of the cost of a really good, substantial, well-constructed buildings. Personally, we should have been pleased had the committee accepted the plans of the angered architects, as in that case they would have learned by experience the folly of promiscuous, unresisted, competitive plan seeking, which thows open the doors of opportunity to every pretender, and practically reduces the skill, experience, and abilities of the educated architects, to a level with incompetents, or lifts the latter at once to a professional eminence which would never be gained by them through a lifetime of personal attempts at regular practice.

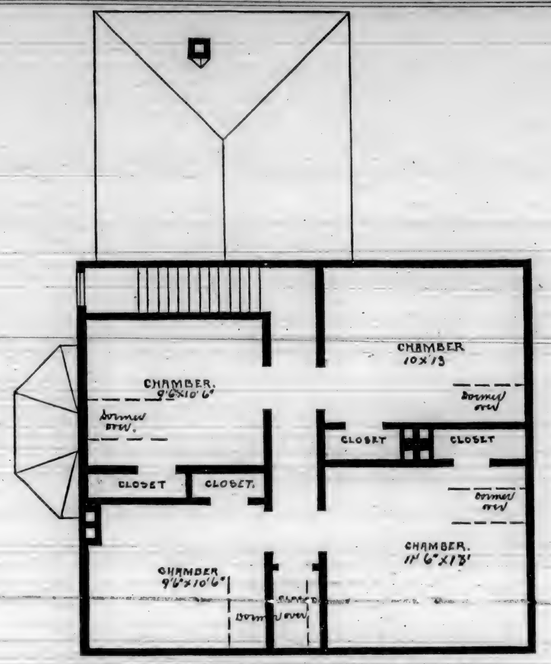

PLATE 8.—SECOND FLOOR PLAN $3,000 DWELLING.

Final Action.

The gentlemen managing the Veteran Home matter, met on Saturday, the 6th inst., and decided, by an unanimous vote, to adopt the McDougall & Son's plans. In substantiation of all that we have said in this and other connections of similar character, the following was developed, viz: that the invitations soliciting architects to complete upon the uncertain and unsatisfactory basis proposed in the invitation resulted in three sets of plans being submitted, although there are some sixty or more architects in San Francisco; that only two of these received special consideration; that the Newsom plans were at first favored by some of the Committee, upon the grounds of stated cost. To secure their adoption, their authors proposed a price at which the building could not be built, and if they had entered into a responsible bond to carry out their plans at the cost proposed, they would have found themselves or their bondsmen involved in a loss of several thousand dollars. This we state upon our own practical knowledge of the cost of buildings, and in opposition to the expressed view of the Newsom Bros. They may consider themselves fortunate in escaping the difficulties which would have been realized by them had they been successful in having their plans adopted.

It was further developed, that some of the gentlemen of the Committee were incapable of intelligent decision as to the merits of the respective plans, as some of them confessed to the fact that they had had "competent outside parties" to pass their opinion upon the plans, and upon the result of the judgment of such parties conclusions had been reached by members of the Committee. This fact needs no comment, and clearly sustains our position as to the unqualified unjustness of competitive contests for plans.

Had the Committee selected the Messrs. McDougalls, or any other competent architects, without contest, they would have secured, perhaps, precisely the same plans, or others equally meritorious, without any of the unpleasantnesses which have occurred, and saved all the annoyances which have grown out of this competition; for certainly the bandying back and forth of "they lie," between members of the Committee and the Committee as a whole and the defeated architects, cannot be pleasing to either parties. The Newsoms have insisted and persist in charging unfair and double dealing upon the Committee, and claiming that the whole transaction has been more or less permeated with falsehood on the part of the Committee, while the Committee in session personally gave the "lie" to the Newsom statements. As to the real merits of the contest we know nothing, beyond the sayings and bickerings of the respective parties; but the sum of the whole matter strongly sustains us in our condemnation of competitive plan making, which in scarce a single instance is not surrounded with a state of facts similiar in character to those appearing in the case under notice.

How to Select a File.

Most of our readers have more or less use for files, and a little information on how to select them cannot come amiss: On starting out to purchase a file, bear it well in mind that there are several qualities made by some file makers, as many as four qualities—first, second, third, and fourth. The first quality is, of course, the best, and represents about 75 per cent. of a file manufacturer's product, the other qualities taking up the remaining 25 per cent. Firm names are always stamped on files before they are tempered, and if, after they are finished, any of them are found to be poorly cut or badly tempered, the firm name is ground off, and one of several fancy names coined for all qualities below the first is stamped on each file belonging to a certain quality. Thus if a file maker should select the word "Jumbo" for his second quality files, all of his files which are too poor for the first quality and too good for the third have "Jumbo" stamped on them. First-quality files only bear the name of the maker, while fourth-quality ones generally bear no name at all, and are seldom seen and more seldom sold. When you have thought of all these things, ask the dealer for a first-quality file, bearing the name of some well and favorably known file maker—one that you have heard of yourself, if you ever heard of one. Select the heaviest file in the box (if there is any difference in the weight of them), for a heavy file is generally truer than a light one of nominally the same size, and is better for recutting—a recut file, by the way, being just as good as a new one. Take the file to the light and hold it in a horizontal position, the point of it toward you. The teeth of the file will now be pointing toward you, enabling you to detect easily any and all imperfections that a bad file is heir to. If the confirmation of the teeth is irregular or uneven, or if the color of the file is not uniform, let it severely alone. A spotted or mottled file denotes uneveness of temper. If, on the other hand, the file presents a clean, white color, it denotes that the temper of it is hard and even throughout; and if, besides this, it has regular and perfect teeth and bears the maker's name, you may rest assured that it is an excellent file. The best files are tempered at a low heat. Files of certain sizes and numbers made since the first of June are of uniform weight, the file manufacturers of the United States having agreed upon a standard of weights and sizes.—*The Wood-Worker.*

The Old Home of Henry Clay.

The house is built of brick and is quite modern in its architecture. It commands an extensive view of the surrounding country, and its front is handsomely decorated with growing flowers of almost every description. It is a rectangular structure with two wings, and appears to have been constructed for comfort rather than for show. The interior is nicely furnished and richly finished in white ash and butternut woods cut from the place. Ash formerly predominated here, and from this circumstance the place derived the name of Ashland. —*The Builder.*

IVES' PATENT DOOR BOLTS.

Sold by all Hardware Dealers.

(APPLIED WHOLLY BY BORING.)

HOBART B. IVES, NEW HAVEN, CONN.
Sole Manufacturer and Patentee.

ARCHITECTURAL PUBLICATIONS.

Modern Architectural Designs and Details.

The plan of this work is very comprehensive in its character. Numerous designs are given illustrating the Eastlake, Elizabethan, and Queen Anne styles of architecture. Complete plans of each, together with full and comprehensive details, are produced in a manner that will gratify the tastes of any architect or property owner. Price, $10.00.

Lakey's Village and Country Homes.

This is a large work, and just suited to those parties in the country who live too far away from an architect to secure his services. Designs are given for all prices of village and country homes. Several pages of details are also introduced. Price, $5.00.

American Cottage Homes.

This work has had an unprecedented sale in the United States since the reduction in price. The book is a large one, and contains many illustrations in the prominent later styles of architecture. Prices are given for which each design can be built. In California, however, the price in nearly every instance would have to be almost doubled to correspond to cost of work in this State. Being sole agents on this coast for the above work, we are prepared to make liberal terms to agents. Price, $3.00.

Detail Cottage and Constructive Architecture.

To the general country mechanics, this work is invaluable. Every part of a building is thoroughly detailed, including store fixtures, counters, fences, etc. Price, $10.00.

Model Homes.

A work containing a great many designs in the prevalent New England style. Price, $1.00.

Complete and Comprehensive Details.

This is the first work of its kind ever published in this country. The author justly remarks, "Ideas are as necessary as tools. Tools have no edge without them." These details furnish the mechanic with nearly eleven hundred ideas, and practical ideas that you can use every day. 40 plates 20x26 inches in size, are given for the small amount of $2.00. AGENTS CAN MAKE $5.00 PER DAY STEADY, HANDLING THIS WORK. Being sole agents on this coast, we are prepared to make liberal terms to canvassers.

Artistic Homes.

A. W. Fuller, a well-known architect, has given to the general public, for a small price, a very neat work containing 44 plates in the Queen Anne style of Architecture. Price, $3.50.

Interiors and Interior Details.

A large work, and as its name implies, contains details for every style of interior finish. The plates are all handsomely lithographed. Price, $7.50.

Practical Lessons in Architectural Drawing.

There is not a draughtsman in this country but that will be benefited by the possession of this work. As its name implies, it is strictly a PRACTICAL WORK. Price, $2.50.

Modern House Painting.

A new work of novel design, presenting numerous elevations of houses in colors precisely as they will appear when finished. Price, $5.00.

MECHANICAL PUBLICATIONS.

Steel Square and its Uses.

Probably no work of modern times has met with so cordial a welcome from mechanics in every part of the country as the one under notice. Over 800 copies have been sold through our agency since its introduction on this coast. Every mechanic should possess a copy. Price, 75 cents.

Science of Carpentry made Easy.

The work, *par excellence*, for every mechanic to have in his possession. It is thoroughly practical in its character, and contains much information not to be found in any other publication. It excels in its methods of obtaining the length and bevels of every description of rafters, both common, hip, and valley. By special arrangements with the author we are enabled to give this work and the CALIFORNIA ARCHITECT AND BUILDING NEWS, for one year for the sum of $5.50. Price of book alone, $5.00.

Gould's Carpentry Combined with Steel Square Problems.

A work similar in character to the above. The author, being a practical mechanic, has endeavored to make his ideas so plain that any one by reading, with a little study, can thoroughly master all the problems incident to the use of the Steel Square. Price, $2.50.

American Stair Builder's Guide.

By the same author as the above work. With the aid of the rules and illustrations given, the young mechanic can, in a very short time, be enabled to lay out any and all kinds of stair work. Price, $3.00.

Builder's Guide and Estimator's Price Book.

This work is chiefly intended to assist the Builder and Contractor in making estimates of the cost of work they may be competing for. It is written by the author of the STEEL SQUARE AND ITS USES, which fact is a guarantee that the book is practical in its character. Price, $2.00.

Modern House Companion and Builder's Guide.

A handbook of carpentry for the coat pocket. Among the illustrations and descriptions of the various kinds of works are the following: Pitch, hip, valley, and mansard roofs, angle rafters on French roofs, mitering circular moldings, stair work, etc. Every mechanic should possess a copy, and thereby fit himself to become a master of his trade. Price, $1.25.

Our space is too limited to notice fully every book on our list. Besides those enumerated, we can send the following-named works to any address in the United States upon receipt of the price:

Grimshaw on Saws	$4.00
Francke's Monuments	9.00
Plasterer's Manual	75
Foundations and Foundation Walls	1 50
Sewer Gas and its Dangers	1.25
Art of Saw Filing	75
Carpenter's Pocket Companion	50
Workshop Companion	35
Mechanics' Geometry	5.00
Standard Sign Writer	2.00
Fancy Alphabets	50
Street, Store, and Bank Fronts	4.00
Village Builder and Supplement	10.00
Artisan	5.00

Hods: Their Construction and Use.

Hods are of two kinds. One form of hod is devised for carrying bricks, and the other for the transportation of mortar. While differing somewhat in purpose and balance, the two species of hod are yet so closely allied as to be utterly indistinguishable when apart. Indeed, it is a matter of grave interest to men that during the whirl of centuries, when every other inanimate thing has, through the indomitable perseverance of invention, been forced through a process of evolution that has robbed it of almost every semblance of its pristine nature, the hod remains to-day in structure and design exactly as the hod originally was. At present hods are cheap. Eighty-four cents will purchase one. The craze for all that is æsthetic, early English, Japanese, Etruscan, or antique has passed by the hod unchallenged. The early Irish hod reigns supreme.

The dimensions of a mortar hod are as follows: Length of bowl, 22⅜ inches; mean depth of bowl, 9½ inches; greatest width of bowl, 9¼ inches; height of back piece, 12⅜ inches; width of pieces forming lateral sections of bowl, 11¼ inches. The dimensions of a brick hod, it will be seen, are different. They are as follows: Length of bowl, 23⅞ inches; mean depth of bowl, 8 inches; greatest width of bowl, 8½ inches; height of back piece, 10¼ inches; width of pieces forming lateral sections of bowl, 8⅞ inches. It is generally conceded that the mortar hod is built larger than the brick hod, so as to make the weight when both are loaded as nearly equal as possible.

The shank or handle is 4 feet 2½ inches for each species of hod, and the shoulder rest is always 9 inches long, 3 inches wide, and 1¼ inches thick. This shoulder rest is attached to the inverted ridge pole of the hod, and prevents the edge from cutting into the shoulder of the proprietor.

Touching the materials used in hod building, it may be said that the earliest ideas still obtain. Iron hods have been tried, but abandoned, because they were liable to rust and to become cracked when dropped six or seven stories by proprietors, who invariably and instantly relinquish all ideas and implements of labor at the stroke of 12 and of 6. The verdict of ages is that the bowl of the hod shall be of yellow pine, and the shank a hickory pole with the bark on. In constructing a hod, it is found necessary to use thirty-three nails for the brick species, and twenty-nine nails and four screws for the kind intended for mortar. The screws are used in the latter instance to fasten the two arms of the shank to the bowl, because screws do not leave holes, as do nails when they become loosened. Small holes allow mortar to escape, and are therefore open to objections. In making the bowl of a hod, eight-penny nails are used; four-penny nails answer best for the shoulder rest, and shingle nails for securing a narrow slip of sheet iron that runs over the top of the back piece of the bowl for the purpose of imparting additional strength. All of the nails are machine made, with the exception of those used in fastening the shank to the bowl, which are hand made and highly malleable. The mortar hod, besides having four screws, is lined at the seams with white lead. It has been considered somewhat superior to the brick hod. The weight of hods one hour after completion is ascertained to be exactly as follows: Brick hod, 9 pounds 6 ounces; mortar hod, 10 pounds 3 ounces. Fifteen bricks are carried in the common hod.

There is a widespread impression that the shank of a hod is steamed after being split into the V-shape necessary to accommodate the bowl. This is erroneous. The shank, after being slit for a distance of 7½ inches, is violently forced asunder by pressure against the wedge-like base of the bowl, and is secured within that position.

Very many hods are owned privately, and many thousands more are owned by a large company up town, which makes hods and rents them to builders along with its patent hod elevators, The introduction of hod elevators, oddly enough, met with no opposition from individual proprietors of hods, but, on the contrary, was warmly welcomed by them. The elevators do the work of many men, but as building has increased in a satisfactory ratio, there has always been enough work for men who decided to adopt the hod as a means of advancement or sustenance. Indeed, so well have the individual hod proprietors in question adapted themselves to the existing state of things, that they absolutely refuse to climb higher than the second story now, and builders must, perforce, employ the elevators for stories of a loftier pitch.

At no time in the annals of the city has the hod industry been at a higher tide of prosperity. Thus the outlook for the hod is as bright as its history has been unvarying.—*New York Sun.*

Sawdust in the Upper Mississippi.

The statement was made some time ago on what seemed to be good authority, that the upper Mississippi was gradually becoming filled with sawdust, and that it was or soon would be detrimental to navigation. *Wood and Iron* says that a joint committee of prominent business men and steamboat men of St. Paul and Minneapolis have been making an investigation of this matter, and found no sawdust accumulating in the main channel, and think the accumulation in the eddies and shallows will prove and advantage, instead of, as was at one time feared, a serious impediment, to navagation; that is, by lodging on the wing-bars and shallows, it serves the purpose of protecting them from the washing of the current, by which the sand was removed and deposited in the main channel.

Shingling Seat or Jack on Steep Roofs.

The best and cheapest plan adopted for the purpose is made about in this manner: Take a bar of iron about 1¼ inch by ¼ inch, 15 or 16 inches loug, flatten out to an edge, one end to a thin blade, then bend to a right angle 5 inches from the other end, drawing out a small point projecting out and down at or near the angle. The flattened end is pushed up under a course of shingles, until the sharp point at the angle rests upon the thick end of the shingle of the course upon which the iron rests; a slight stroke will set the point in the shingle and prevent any possiblity of sliding out of place. One of the above irons every eight or ten feet with a 2x4 scantling laid from one to the other is all the help a person will need on any roof, however steep it may be.—*Builder and Wood-worker.*

Band Saws.

Band-sawing, an art or industry which from the advantages it possesses over other methods of dividing wood is growing so rapidly and steadily into public favor as to be by many considered the saw of the future, is essentially a modern invention. Probably the earliest known attempt to saw wood by this means was made in 1808, by Wm. Newberry; but, although his machine contained all the essential features of the modern machine, it failed as a practical tool, because at that time band saws could not be made of sufficient length, except by brazing a number of short pieces together, a process which was found very detrimental to the uniformity and tenacity so requisite in these saws. Although a band saw when at work appears a very simple thing, merely a narrow pliable band or belt of steel, with a notched or serrated edge, running over two pulleys, it has, in the process of its manufacture, offered a paradoxical problem. It must be soft and flexible enough to work rapidly round the pulleys, yet hard enough to retain a keen cutting edge; whilst stiff and tough, to resist firmly the pushing and straining tendency of a quick feed.

Many attempts were made to overcome these difficulties, but it was not until a young and beautiful empress led the fashion by wearing crinolines, and all-powerful fashion imperiously demanded the production of long lengths of thin, light, pliable, highly tempered steel, that saw makers, after many failures, hit upon the right method of producing their blades of sufficient length and uniformity of temper to render the band saw machine a success.

At the French Exhibition of 1855 was shown what was probably the first *really practicable* band-sawing machine, and the merits of the new system were at once recognized, a demand for such tools immediately arose, and, as is always the case, many competitors started to supply the demand, till at the present day few wood-working establishments are without one or more of these machines, chiefly, however, employed on the lighter kinds of work; for, although our clever American cousins have already adapted the band saw to the cutting up of large round timber—feeding the saw on the rack-bench principle, as described in a recent number of the *Timber Trades Journal*—it has not yet reached that wide application for heavy work to which its many merits entitle it.

To M. Perin, of Paris, undoubtedly belongs the honor of introducing the band saw as a practical tool to the public, and although it is a notorious and somewhat singular fact that French band saws are chiefly made from Sheffield steel, the trade has hitherto remained mainly in the hands of our neighbors across the Channel, but at least one English firm, that of Messrs. Moses Eadon & Sons, of President Works, Sheffield, has throughout competed steadily and successfully with their foreign rivals.

In 1856 Messrs. Eadon took out a patent—No. 1,628—for the manufacture of solid endless band or belt saws, and their system was for a time a great success; but experience and the continued march of improvements have shown that these saws can be made with one joint at much less cost, and with great uniformity of strength, temper, and substance, than by the other method; they have therefore abandoned their original plans, and, guided by long practical experience, have erected new and special machinery which, they claim, enables them to make band saws of a *quality* and *price* which must ultimately give them a monopoly of this now important trade. A full description of their processes of manufactures, from the crude iron to the finished saw, was given in the pages of this *Journal* on July 24th, 1880.

As the action of a saw is to sever the wood by cutting or tearing away the material, it is obvious that the thinner it can be had the more economical it is, both of power and material—two most important considerations in these days of keen competition, and with the ever-increasing scarcity and dearness of timber. Herein lies one of the main claims of the band saw to popular favor, for not only is the blade itself thin in comparison, but it requires a comparatively small or narrow set; consequently it wastes less wood and requires less power to effect its passage through a log.

The band saw shares with the circular saw alone the great advantage of a continuous cut, there is no loss of time or power by a non-cutting back stroke, the sawdust also being constantly carried down; it requires no blower, as does it nearest rival, the jigger saw, to prevent clogging, and to enable the workman to see the line he is cutting to. Moreover, the length of the band saw gives it a great immunity from heating, there being but a very small proportion of its length (say 2 or 3 per cent.) in actual frictional contact, and this again cooled by the rapid passage of the saw through the air.

As the best band-sawing machines are now made with tables to cant to any angle, this saw is used extensively for cutting beveled or ship timber, for which purpose and for curves and bent timber it is probably unrivaled. The band saw is also rapidly growing into favor for sawing cold iron and steel, and as band *knives* they are much used for cutting skins, india-rubber, cloth, etc., etc.; but on account of these, however interesting, scarcely comes within the scope of a journal devoted to timber.

The band saw, however, like every other tool, possesses its disadvantages. Chief amongst these is its inability to break, and although the fault is doubtless sometimes in the saw, a far more frequent cause will be found in careless or irregular setting and sharpening, it being plain that unless the greatest uniformity is maintained in both these important matters, the tension will be unequal and the saw drag.

In setting it should be remembered that soft wood requires a larger set than hard wood, and that small curves are better cut with more set than is necessary for larger curves. In sharpening care should be taken, not only to keep the teeth uniform in size, but to keep the bottom of the gullet nicely rounded, by which the chances of fracture are rendered much less than when the bottom of the tooth forms an acute angle. It is universally admitted that thick, round-edged files are the best for sharpening band saws. The blade being extremely thin, the tension is difficult to keep, changing instantly with the temperature, and the pulleys should be eased to prevent it breaking when cooling down after working.

Too coarse a feed will not only cause the saw to choke, but will cause the back to be crowded and get longer, like the edge of a leather belt that is constantly running against the strap guides.

It may be taken as a maxim that the larger the pulleys, and consequent curve of the saw, the less is the liability to fracture, and the pulleys should in all cases be covered with a ring of india-rubber, which is now made specially for this purpose, for not only are the teeth protected thereby, but the blade is given a greater "grip" when the pulleys are so covered.

In spite of these little disadvantages (and it is hoped that a perusal of the cause and effect will lead to a greater care being taken by removing the one to prevent the other), there can be doubt the band saw has a great future before it; and the sight of a band saw, well made, well set and sharpened, working on a good machine, under the hands of a man "as knows his business," is one to cause an old-fashioned sawyer to exclaim: "Of all the saws I ever saw saw, I never saw a saw saw as this saw saws!"
—ROBT. RENTON EADON, in the *Timber Trades Journal.*

Reckless Bidding.

Notwithstanding that a healthful and prosperous condition of things has ruled in San Francisco in building operations during the past year, as far as the number of contracts let are concerned, a singular recklessness and virtual disregard of results has prevailed among contractors in all the various branches of house construction, by which opportunities for profitable contracts have been largely sacrificed to the prevailing spirit of reckless bidding to secure contracts at all hazards. It is a matter of grave doubt whether contractors, *as a whole*, have gained five per cent. upon their financial standing during the past twelve months. That is to say, if after deducting the losses generally that have been made from the profits realized *as a whole* upon contracts, the contracting fraternity are financially five per cent. better off at the end than at the beginning of 1882. Some, of course, have done well, but the much larger number have gained nothing more than a living from the contract-money used during the progress of work executed by them, while scores have paid pro ratio, with debit accounts against them of greater or less magnitude, augmenting, perhaps, to as great a sum as the total of profits enjoyed by those who have been successful.

We refer to this state of facts because of its demoralizing influence upon the building business. Men who undertake work at less than fair recompense naturally seek to equalize the discrepency by the avoidance of contract and specification obligations. Even those otherwise disposed to act honestly, when placed under the pressure of financial losses, are apt to practice the old maxim of self-preservation as the first law of nature, and to lessen or avoid disastrous financial results, seldom accept the situation and faithfully recognize and fulfill the obligation resting upon them, if there exist any possible means of escape. When losses and impaired credit are placed in the balances with honesty and integrity, the former more generally outweighs the latter, and for the time being, at least, moral ethics become valueless.

To the uninformed it may appear strange that such a state of facts should exist among so intelligent a class of men as the average of California contractors. But when the additional fact is considered that very many are pursuing the contracting business "on cheek"—i. e., men possessing no right knowledge of the science of construction or mechanical principles; men so utterly incapable to perform the duties of journeymen that they could not find engagements upon any works upon which mechanical skill and proficiency was a perequisite to employment—the wonder ceases. We have seen contracts originating from offices in which all right architectural rules were ignored, signed with "his (X) mark," and that, too, in one instance, wherein the sum of contract was nearly $10,000. Is it, then, to be wondered at that with inability on the part of the contractor to even sign his own name, that irregularities should occur? If the evils resulting from this condition of affairs were confined to the degenerate characters causing them, decent men might laugh. But the pernicions effects are felt by the good and worthy, who must, to some extent at least, compete with the inferior element; for, unfortunately, the generality of owners, in ignorance of the underlying facts, are willing to risk engagement with the latter on the basis of low price, rather than pay better men more than an insignificant increased sum of money, if any. Good men, as contractors, are desired by owners, but as a rule actually preferred only when they consent to accept the profitless amount figured out, or more generally *guessed at*, by mechanical scalawags.

It is to be regretted that the responsible and reliable class of contractors submit to all this

without some practical effort to correct the error; that they accept the situation and seek to work around the thorny hedges, rather than by united, intelligent effort seeking to clear away the obstructions which confines building operations within the restriction placed upon it by the methods and acts of the inferior classes. While owners, as a rule, are anxious to save all that is possible in the cost of erecting buildings, not one in twenty would be willing to enter into contract with "scrub" contractors, with an intelligent understanding of the risk they run by so doing of receiving inferior building and workmanship. And it appears plain to us, that if proper measures were adopted by the intelligent and competent men engaged in the erection of buildings, to convince owners, through right showing of the facts known to exist in this connection, a change could be wrought in building procedures which would soon place the inferior contracting element where it should be, beyond the reach of figuring in competition on buildings requiring mechanical integrity and ability.

OUR EXCHANGES.

American Architect and Building News.

This is the only weekly architectural journal published in the United States. The editors, during the past month, in a well-written full-page card, show the benefits that may be derived from every student or draughtsmen in architects' offices subscribing personally to the journal. They justly claim that those receiving benefit from a publication that has SO MUCH INFLUENCE ON THE FUTURE COURSE OF THE YOUNG MEN IN THE PROFESSION, should receive the support of those benefited. The subscription price is $6.00 per year in advance.

Builder and Wood Worker.

This Journal has made grand and rapid strides during the past year towards securing the goal of its ambition; viz., the establishment of a periodical that will compare favorably with any of the same character in the world. The price has been reduced to $1.00 per year. Every mechanic on the coast should at once subscribe.

Carpentry and Building.

Brother Williams in each successive number endeavors to rival its predecessor in the illustrations and practical subjects presented. Well worthy is this journal a place in the library of every one intending to build, as well as in the possession of every practical mechanic. Price, $1.00 per year.

Manufacturer and Builder.

This old-established journal is now in its fourteenth year, proof positive that the editor has succeeded in meeting the wants of the general public. Terms, $2.00 per year in advance.

The Carpenter.

An eight-page journal published in the interests of the workingmen. 50 cents per year.

The Wood Worker.

A new applicant for public favor, and can be had for $1.00 per year. Well worthy of the price.

The Sanitary Engineer.

The most successful of modern sanitary journals. Every article is written by a professional, and therefore the ideas advanced can be depended upon as representing the most brilliant thoughts of the foremost sanitary writers in America. It is a weekly Journal, and is furnished subscribers at $3.00 per year.

The Mechanical News.

But few journals equal the *news* in the artistic manner in which the various designs are executed. Each one shows a master hand. This journal is also superior in the originality of its articles, combining, as they do, practical suggestions in regard to every matter connected with the mechanical trades. Published every two weeks. Price, $1.00 per year.

Scientific American, with Supplement.

This long-established journal has been a regular visitant to our sanctum each week. Nights are sometimes advanced into the wee small hours ere we reluctantly lay this paper down. Every article is well worthy of perusal. The two together can be had for $7.00 per year in advance.

American Machinist.

A weekly edition, beautiful illustrations, DECIDEDLY ORIGINAL ARTICLES, a large corps of correspondents. Surely all these are worth the small price, $3.00 per year. Every machinist, engineer, founder, boiler maker, pattern maker, and blacksmith should vie with each other in extending a royal patronage to this journal.

The Mechanic.

Now in its 13th volume, which fact alone proclaims success. 16 pages. 50 cents per year.

The Artisan.

Published at Nashville, Tenn. There are other papers of this name, and subscribers will be careful in mentioning the one desired. Terms, $2.00 per year.

The Artisan.

Of Cincinnati. Its circulation is principally among the workers in mills and manufactories. 50 cents per year.

Engineering News.

A weekly journal. Price, $1.00 per year. Its name indicates those for whom it is intended.

The Tradesman.

The principal circulation of this journal is in the Southern States. Terms, $2.00 per year.

Timber Trades Journal.

One of the standard publications in England. It contains full information in regard to the price of lumber, etc., from all the manufacturing centers on the islands, as well as the continent. Its trade notes are copied in many different journals, a proof that it is recognized as standard.

American Inventor.

A journal devoted solely to industrial interests. Its name denotes the purpose for which it was established. Price, $1.00 per year.

American Engineer.

$4.00 per year in price; a hundred times that amount in value to every practical engineer in the country. Although not in the category of professionals in this line, we have spent many a pleasant evening studying the problems and communications presented in this truly valuable journal.

The Decorator and Furnisher.

Subscription price, $4.00 per year, including a patent binder. This is a large journal of 38 pages. Every page is illustrated with beautiful designs for decorations, including curtains, draperies, furniture designs, handsome patterns for ceilings in colors, tiles, panels for grates, etc. "Seasonable suggestions," is a group of four figures, decidedly original, and will cause a ripple to spread on the features of old and young. The reading matter is especially instructive to all those who desire pleasant surroundings in their homes.

The Art Amateur.

This old-established journal will deserve the patronage it has received. The illustrations are far superior to what the name indicates, many of them being works of art. The CHARCOAL SKETCHES given in the January number are decidedly *unique*. The lead-pencil sketches by Walter Shirlew are worthy of close study. *Ceramic* decorations are given in profusion. *Interiors* also receive special attention. The literary matter is exceptionally interesting for a journal of this character.

The Builder.

We welcome this NEW journal on our list. We think the editor has made a mistake in not prefixing "AMERICAN" be the two words forming the title, as an English journal by the name chosen has been in existence a long while. The editor has an exceedingly happy style of writing, and we have no doubt the new-comer will be well received. The price has been fixed at $2.00 per year.

The Northwestern Lumberman.

In an article in this issue, entitled "Credit to whom it is due," we have said several things in regard to this old-established journal. The articles in this periodical are well worthy the attention of every lumb r producer, as well as those who use it after it is manufactured. We will be glad when the time comes for the editors to establish a branch paper on this coast, as the lumber interests here are assuming gigantic proportions. Just think of it, friend *Lumberman*, before that 50 (?) billion of feet of lumber is used up, which is supposed to be in this State! Price, $4.00 per year.

The above embrace a part of the numerous exchanges on our list. Space forbids a more extended report in this issue. Of State exchanges, we have so many that it would be impossible for us to mention them all without too great a sacrifice of original articles. There is not a county in this State or Oregon from which we do not receive several papers marked x. The advantage to those seeking BUILDING INTELLIGENCE is at once apparent. The editors of some of the x are not satisfied with sending us their respective papers, but in addition, send us full written lists of all building operations in their immediate neighborhood. Again: as errors will creep in once in a while, our country brethren have in many instances sent us postals notifying us of the mistake. Notably is this the case in regard to Brother Saunders of the *Woodland Democrat*. A party procured one of our blanks and sent us false information. Upon learning the falsity of the statement sent us, we immediately sent a lengthy card to Brother S., offering to pay for it as an ad. Not only did Brother S. publish the card in full, and ever add a well-worded caution to such false itemizers in the future, but kindly and respectfully declined any pay. Aided by such worthy help from every part of the State, it is no wonder that our journal has become to be looked upon as the GREAT REPRESENTATIVE OF THE BUILDING INTERESTS ON THIS COAST.

Fire Protection of Mills and Construction of Mill Floors.

The author of this work, C. J. H. Woodbury, has evidently spent years of *practical* life amongst the mills and factories of the East. It if seldom one picks up a work that contains so much *practical information* written in such a clear, easy style. Electric lighting is treated in a manner that at once arrests the attention of the reader, and is of great value to all mill owners. The price has been fixed at $2.50, so that every one can afford to have this work in their library. We will refer to this work again in another issue.

Vibration in Buildings.

This is a trouble which manufacturing establishments often have to contend with. It is occasioned by the vibration of some other object, which strikes the key or note of the building—a sort of responsive vibration, and is termed synchronous. An exchange in speaking on this matter says: "At one of the print-works at North Adams, Mass., a new and unoccupied building was found to vibrate in consequence of the puffing of a small steam engine sixty feet away. At Centredale, R. I., it has been necessary to change the height of the column of water flowing over the dam, to prevent the excessive vibration of the adjacent mill. At Amesbury, Mass., out of eleven mills that are near the river, two vibrate when water in certain quantities flows over the dam, but the tremor can be wholly stopped by changing the flow of water. The most frequent cause of vibration is due to the running of the machinery, and it has repeatedly happened that a complete cessation has been obtained by increasing or lessening the speed at which the machinery is run. This is not always profitable or possible, and the fact that this vibration results in a loss of power, variously estimated at from ten to twenty per cent., is a strong argument in favor of the construction of one-story mills, which would necessarily vibrate much less than factories having a height of six or eight stories. But it is not alone the loss of power that has to be considered; for in addition, there is the straining of building and machinery, and in the manufacture of textile fabrics this unsteadiness causes a great breakage in the threads and consequent damage to the material."

Straw Lumber.

Resent newspaper statements convey the information that a company has been formed for the purpose of engaging in the manufacture of straw lumber, after the process devised by Mr. S. H. Hamilton, of Lawrence, Kan.

The first publicity given to Mr. Hamilton's process was at the meeting of the American Association for the Advancement of Science, last year; and in our "Association Notes" for that year we gave a brief statement of the invention, which at the time attracted much attention from its novelty and the meritorious features claimed for it.

The company above referred to has lately erected a large mill in Lawrence, Kan., and is now engaged in turning out straw lumber in limited quantities. The machinery used has been constructed specially for the purpose, but in some respects it resembles that used in paper manufacture. All kinds of straw are used, the raw material being first made up into pulp in the usual manner, and than rolled into thin sheets, twenty-four of which would make an inch in thickness. While wet and hot, and in a condition to readily absorb liquids, these sheets are passed through a vat containing certain chemical impregnating substances heated to 280° Fah., by which treatment they become thoroughly impregnated with the materials of the bath. The sheets are than passed through a series of polished iron rollers; cement is applied to them by a special arrangement provided for the purpose, and the ultimate result is the production of a hard, firm, and completely fire-proof slab, which is properly described by the name "straw lumber" which is given to it. After manufacture, the lumber is allowed to thoroughly dry, an operation which takes from a week to a month, according to thickness. Upon the thoroughness of the drying depends its consequent freedom from warping. The drying is done in a dry-storehouse, kiln-drying being found not to answer.

On the authority of the *Northwestern Lumberman*, we glean that thus far the straw lumber has been made principally into flooring, ceilings, blackboard strips, and friction wheels. The present machinery can only turn out boards of different thicknesses, 13 feet long and 3 feet wide, which can be sawed into any shape, the same as common lumber. They cannot be split into thinner slabs, but must have the right thickness for the use intended. With the extension of the use of the new material, additional machinery will be provided for turning out material of any length, width, and thickness that may be desired. While the capabilities of straw lumber, in the estimation of our contemporary, seem limitless, the manufacturers make no extravagant claims for it, only seeking to have it applied to the more simple and practical wants until experience in its manufacture and uses shall enable them to intelligently extend its sphere.

When finished, it looks like what it is—a slab made from straw. The surface has an appearance of unevenness, which is deceptive, for while it looks rough, it is found to be smooth. The fibrous character of materials of which it is made give it a streaky appearance. It is very hard, compact, and firm, saws perfectly smooth, and a nail can be driven through it very cleanly, and without cracking, splitting, or tearing, as wood often does. The makers claim that it can be readily polished, finished, and decorated upon the surface in any desired manner, and that it can be worked, sawed, planed, etc., the same as wood. The new material is affirmed to be as strong, or stronger, than wood, to surpass it in endurance, and to possess water and fire proof qualities to an extraordinary degree. For floors and ceilings it is said to have shown itself to possess all the meritorious qualities claimed for it. Friction wheels made of it are affirmed to have outlasted three sole-leather wheels. It is much heavier than wood slabs of equal dimensions, and this may be an objection for certain uses. It is proposed to use it extensively for veneer. It is reported that the new material is about to be used in the construction of a large six-story building, covering an entire block, which is about to be erected by Mr. John V. Farrell, an extensive dry-goods operator in Chicago.—*Manufacturer and Builder.*

Monument to Victor Emmanuel.

The commission which has charge of the national monument to King Victor Emmanuel of Italy, finding none of the plans submitted in the last great competition quite satisfactory, has opened a new one, for which a year of preparation is given, the designs not being received until December 1st, 1883. Some modifications are made in the first programme, the site being now definitely fixed on the Capitoline Hill, upon the ground now occupied by the barracks of the municipal guards and the residence of the general of the Capuchins. The total height of the monument is restricted to twenty-nine metres, and an equestrian statue of the late king is to form the most important portion. Considering the magnificent dimensions contemplated in the most of the designs of the previous competition, these very modest requirements are a little surprising, and it certainly seems as if the Italians had concluded that sixteen hundred thousand dollars was too much to devote to a dead man's memory; but the new plan contemplates the extension of the Corso to the foot of the Capitoline Hill, and the construction of a grand staircase leading upward to the monument, so that the cost of the whole project will at least be very considerable. What, if any, may be stipulations as to the cost of the work and the premiums offered we do not learn, or whether the competition is to be confined to Italians, as was once proposed.—*American Architect.*

The Mysteries of Metals.

Notwithstanding the wonderful progress, says an exchange, that has been made during the last half-century in the constitution and working of the useful metals, there is yet a vast deal to be learned. The metals, when pure, are commonly supposed to be simple elements, yet there are some reasons for supposing that it may be proved that at least some of them are compounds. Even the great Faraday give utterance to the thought that the dreams of the alchemist might yet be realized that gold and other metals might be found to be compounds, and that means might be divised whereby those compounds might beseparated, and afterward so differently reunited that the baser metals might be converted into precious. The changes which are wrought in iron and steel by converting, annealing, and hardening processes are far from being understood by the most advanced matallurgists of the present day. The mysteries of hydrogen gas and its intimate relations with iron are as much a puzzle as they were fifty years ago, and the theory advanced by Graham, that hydrogen is a metal, is still maintained by many chemists. It is only a few years ago that absolutely pure iron became known to scientists, and it is now shown to be a metal almost as "unstable as water," and still found in the laboratory as a great curiosity. What had previously been known as pure iron was shown by Jacobi to be a compound of iron and hydrogen. He first separated the two so-called elements. During the process the iron increased in volume, changed from a dark to a silver-white substance, very ductile, and so soft as to be nearly as readily cut as lead. The experiment proved that hydrogen played an important part in hardening and tempering—as much so as carbon—but how or why none know to this day. It is found that much more difficulty is experienced in rolling and otherwise manipulating gold in a factory where much electricity is generated by the action of machinery than in a room where no machinery is in operation, and where, consequently, frictional electricity is absent. The trouble is manifested in a disposition of the edges of the plates of thin bars to crack. Many other peculiarities, already known, might be mentioned, and there is no doubt that closer observation will largely increase the number of curious and yet inexplicable phenomena connected with the working and general characteristics of the metals, both useful and precious.—*Mechanical News.*

A Love of a Room.

A young working-girl of this city, by the exercise of her own innate good taste, and putting every spare penny where it would do the most good, has furnished forth a charming room at comparatively small expense, and sufficiently æsthetic to please the most fastidious person. The floor, painted by her own hands, is a dark walnut shade, partly covered by a large rug made of cheap ingrain carpet in a small pattern of cream and olive, bordered by a broad band of plain olive felt. The inexpensive wall paper is plain olive, flecked, with pink, finished by a narrow olive frieze, terminating at the corners with a cluster of four tiny pink fans. One window faces a dingy brick wall, and she painted the window panes in bright water colors, following a pretty traced pattern, which gives a bit of stained glass quite effective in the pretty room. The other window is draped gracefully with long full folds of sprigged muslin, depending from rings on a plain pine roll, to be replaced in the winter with a heavier curtain of olive cotton flannel.

The furniture is light wood, and a lamp with rosy transparency stands on a five o'clock teatable of unvarnished wood, and throws a soft light over the room, which also contains books, shelves of pine, a couple of second-hand easy-chairs, and a small dry-goods box for shoes, covered by her own hands, with pink and olive cretonne. A large clothes-horse, on which she pasted the story of Cinderella in Walter Crane's pictures, over olive paper, shuts of the wash-stand and bedstead from view. The toilet accessories, set off with fresh sprigged muslin over a pink lining, are a pink and white washbowl and a large pitcher of the quaint shape that comes now in the cheaper grades of china; a second-hand wardrobe, draped with a *portiere* of olive Canton flannel, contains the unæsthetic dust-pan, brooms, and other homely articles necessary to neatness and comfort, all trifles of that description bought at the five-cent counters. A pretty willow rocking-chair, ornamented with olive and pink ribbons, and a knitted hassock to match, the two latter Christmas gifts, stand on the rug.

On the olive-draped mantel are grandma's Nankin teapot, two tall silver candlesticks and a large ginger jar, not decorated and spoiled with gummed-on pictures, but left in its pristine blue and white beauty, filled with white daisies gathered on Sunday afternoon walks. Two or three photographs of good subjects, that are better than chromos and cost less, hang on the wall, and complete the pretty refuge of this proud and industrious girl, who is self-respecting enough to earn her own living rather than to be dependent upon her rich relations.—*Hartford Times.*

Increasing Handsomely.

Our acknowledgments are due to the large number of mechanics and others representing all classes of society, and almost every profession and calling—ladies and well-to-do property owners included—who nave handed in or forwarded by mail their names and subscription amounts to this journal during the past thirty days. No better evidence of its popularity and appreciation by those whose interests are specially represented in its columns, and by owners of real estate and communities generally, can be offered than that of liberal subscription patronage. We hope that within the succeeding thirty days a thousand or two more new names will be received, and every present subscriber who has not will immediately forward by mail, call and pay at this office, or be prepared with the cash to pay up when called upon by the representatives of this journal for the subscription amount for 1883.

DEALERS IN BUILDING MATERIALS AND HOUSE FURNISHING GOODS,

Will best subserve their interests by advertising in the columns of this journal, which is taken by very many owners, and by all architects—except a few acrimonious dispositions who feed and live upon the delusion that they stand high above even their superiors in architecural knowledge.

Tempering a Chopping Ax.

Take six pounds of tallow and two pounds of bees-wax, and one ounce of finely pulverized sal ammoniac. Melt the tallow and bees-wax together, and then put in the sal ammoniac. Pour the mixture into a sheet-iron box, which, for convenience, should be two feet long, four inches wide, and four inches deep. A box of these dimensions will hold enough of the mixture for tempering any sized ax, hoe or other tool. When the ax is ready for tempering, heat to a white red; then put it into the mixture deep enough to cover the steel all over. Let it remain from one to two minutes, then put in the water the same way. Then draw to a blue color and return to the mixture as before. Then hold it over the fire until it becomes dry, and then put it back into the water to cool. Never heat the steel more than to a light red when forged out.

Gas Meters as Helps to Fires.

In most buildings designed for multiple tenancy, like our great apartment houses and the capacious office buildings which comprise so large a part of the business part of this city, it is customary to provide a separate gas meter for each room or suite of rooms. These meters are commonly placed in closets and out of the way corners, and are very apt to be surrounded with much combustible matter.

The connections of meters with the gas pipes are usually, if not always, of lead, a metal that is easily fusible, and the solder with which the plates of the meter are joined together yields even more readily to heat.

Let a fire break out in a building containing, as many buildings do, a score or more of these fragile fire feeders, and the hot air sweeping in advance of the fire will quickly melt the lead or solder. The outpouring gas fill the building with an explosive atmosphere which hastens the spread of the flames, and keeps up an inexhaustible supply of fuel. Such burning gas jets, sometimes of great size, are to be seen after almost every city fire, w.. nothing is left of a building but blackened and broken walls.

The gas poured into burning buildings through such openings doubtless helps materially to account for the surprising suddenness with which many great buildings have been swept by flames; and in all cases the outflow of gas must seriously counteract, if it does not altogether thwart, the efforts of the firemen.

The remedy for this great evil is not so easy to point out. It is obvious that where a multitude of meters are to be distributed through a building, they should be more securely incased, and provided with infusible connections; or some means should be devised whereby the gas supply shall be automatically shut off whenever the temperature rises so as to imperil the integrity of the meter. There should also be near the outer door and readily accessible to firemen some means by which the connection of the house with the gas main in the street can be quickly closed.

There is clearly an opportunity here for useful and profitable invention.—*Scientific American.*

The Hugunin Window Balances.

These balances are not sash locks or catches, but adjustable mechanical substitutes for sash weights; balancing sashes automatically, by controlled friction. They are made in three sizes and widths and put up in neat card boxes, properly labeled, and containing one dozen each, with full directions for applying. They are as easily and cheaply applied as the sash cord pulley. The use of the screw balance greatly simplifies and lessens the expense of fitting up windows by avoiding the use of box casings, pockets, and the hanging of the sash with weights. The balances are put into the sash channels of the frame, and are not attached to the sash—allowing the ready removal of the latter for cleaning, etc. The sashes are both locked with the meeting rail lock, as with weights, at one operation. The rocking-hinge improvment made in 1882 renders it unnecessary to straighten the edges of the sashes so nicely from bevels, etc., and from want of squareness in the window frame to which applied. Samples may be seen at this office.

A square is ⅞ of an inch in length by width of the column.

When money is sent for subscriptions, the receipt of a copy of this journal is an acknowledgment that it has been received. Unless requested, we do not send receipts.

BOUND VOLUMES OF THIS JOURNAL.

Through the kindness of a few of our subscribers sending us numbers of which we were short, we have been enabled to have sixteen complete volumes of this journal bound. When these are gone, we will be unable to supply any more complete sets.

Bound volumes of 1879, 1880, 1881, and 1882 (in one book) complete, with all ads. and covers removed, will be sent to any address upon receipt of $8.00.

Bound volumes 1879 and 1880, in one.....$2.50
" " 1881 and 1882, each $2.50
" " 1880 (only a few left).....$2.00

In 1880 the subscription price of this journal was only $1.50, and we have put the price of bound volumes accordingly.

Volumes of 1882 and the sixteen full sets are all supplied with a full index.

Any one failing to receive a complete index will be supplied by sending a postal card to this office with their address.

Our Fourth Volume.

With the January number we began the fourth volume of this journal. In reality it should be the fifth volume, as it was started in 1879 as a quarterly. We date, however, from January, 1880, as in that year we began its issue as a monthly.

Starting as we did in such a dull period of this State's history, we are more than pleased with our success. There is not a county in the State that this journal does not have many readers. On the Sandwich Islands we have numerous subscribers. Mexico, Oregon, Washington Territory, British Columbia, Nevada, Colorado, and adjacent territories are all well represented on our subscription lists.

This journal is the official organ of the San Francisco Chapter of the American Institute of Architects. In our Professional Column, we have the cards of the leading architects of this coast. It is looked for monthly by a host of material-men who eagerly scan it Building Intelligence. The mechanic awaits its regular appearance, sure of a feast of good items in the various mechanical trades.

This journal is an assured success, as a glance at its advertising pages will show. Our pages are always full, and we have added two pages extra in the last several numbers. This fact ought to convince every material-man that this is *par excellence* the journal in which to advertise their goods, that they may be brought before the parties most interested.

We sincerely thank the various papers for their kindly notice of the beginning of a new volume. In our January number we made no reference to such fact; the only way it could be noticed was by the change of the numbers on our cover, showing that No. 1, Vol. 4, had made its appearance. The fact that so many of our country papers noticed the new volume by such a clew shows that the interest in this journal is not confined to the select few.

Amendment to Section 832 of Civil Code.

Senator Cronan of this city has introduced an amendment to section 832 of the Civil Code, which we hope will receive the approval of both branches of the legislature, and the signature of the Executive. It is a well-known fact that many valuable improvements have been and are delayed, by reason of the requirements of the section as it now stands upon the statute books of the State, and the sooner it is changed the better it will be for the taxable interests of the city. There are cases in which the change may work a seeming hardship, but any one who will disinterestedly review the matter must reach the conclusion that all obstacles in the way of new, better, and more taxable improvements should be removed. The whole matter resolves itself into these two propositions: first, shall owners of unimproved property, desiring to improve the same, have imposed upon them the additional expense of taking care of and underpinning the adjoining premises, the foundations of which are not located at a reasonable and proper depth or shall the owners of such improved foundationed property be required to protect and underpin the same at their own cost? We trust that Senator Cronan will bring to bear the many strong arguments sustaining the change, and that the building interests of San Francisco and other cities will no longer be hindered by the Code as interpreted by the Supreme Court. The section as it stands is a bad conglomeration of the rights and privileges of coterminous owners, and a legal decision either way may be construed from its by no means explicit language.

Prospective Building Improvements.

WHY WE DO NOT REPORT THEM.

Since the first of the year we have received several notes asking that we report in this journal all prospective improvements with which we may be cognizant. We have also been asked, by several on the street, questions relating to the same subject.

We have listened kindly to the suggestions made, and have given the same answer to all; and we desire to make our explanation public, that all may understand the position we assume in the matter.

Any one familiar with the times as they were in 1878 and 1879 will well remember the almost painful anxiety portrayed in the faces of our contractors when a job happened to be in an architect's office for figuring. And architects were careful in giving information in reference to prospective improvements until all the necessary drawings and writings were prepared.

It was during this dull and anxious period with architects and contractors that this journal was started. One of the main reliances for steady increase and continuance of its subscription patronage was to present a truthful report of the buildings in process of erection each month, with the name of the owner, architect, contractor, and cost of same.

In order to get the various items correctly, it was necessary to first obtain the confidence of the different architects, not only in the city, but also throughout the State. Thanks to a personal acquaintanceship with many of our brother professionals, we succeeded beyond our expectations in securing their hearty support and earnest co-operation. From the start we informed all those who furnished us information, that we would only publish contracts after they were signed. The wisdom of this course was soon apparent. We do not remember in all our experience in this city of any period in which so many jobs were figured on that did not go ahead as in the latter part of year 1880 and in 1881. Columns could have been written about contracts that were soon to be let, etc., and that ended in nothing being done.

In the early part of 1882 an association of architects was formed in this city. It has gone on increasing in strength, until it is now one of the largest in the United States in membership. Through its agency the architects are becoming more and more attached to the principles of their profession, and are daily cultivating those social and professional courtesies which should exist among gentlemen assuming the responsible position of practicing architects and which are exemplified by a hearty shake of the hand and a hail brothers well met.

The course we have taken has met the approval of a large majority of the architects of this city and State. Our position, in a few words, is as follows:

By the course we have pursued, we have the pleasure of being welcome to nearly every architect's office in the city. Many of them show us plans in preparation for various edifices contemplated, or in process of preparation, and give us much information in regard to future improvements. When we make our monthly tour for building intelligence, we are always kindly received, and in many instances are

told that a job is expected to be let before we go to print, and if we will call again information in regard to it will be cheerfully given. Of course, we become acquainted with many facts in regard to future improvements, every confidence being placed in us by our brother professionals, and it would be unkind—nay, it would be treacherous—on our part, if we gave a single hint in regard to the facts we learn from our monthly visits, which has not passed beyond all contingencies, and reached a point beyond reasonable probability of suspension, or the possibility of interferences from any source. By this intimation we mean this: that a very large number of cases might be cited in which, after the order to prepare plans have been given, other scheming and unprincipled men, calling themselves architects, but not so as far as any of the more honorable, gentlemanly, and professional attributes are concerned, have brought personal and friendly influences to bear, and resorted to intrigues and misrepresentations by which they have dishonorably diverted engagements made with others to themselves. For this reason, principally, we refrain from publishing anything but what we know to be facts. Another reason is, that fully five per cent. of the jobs figured on do not go ahead, and it is not the purpose of this journal to litter its pages with accounts of things that may never be. What we want is simply *plain, indisputable facts*, and these we propose to give as true as close attention and careful inquiry will accomplish.

Gladly welcome will be the day when the cares and troubles of a professional career are over, and those of a journalistic character alone be assumed.

Proceedings S. F. Chapter of Architects.

The regular meeting of the Chapter was held Friday evening, 2nd inst., President John Wright presiding. The meeting was largely attended and interesting in character. The Committee on Articled Students' Class reported progress, and received instructions to proceed with the matter in hand, and to organize the respective classes. (The opening class in Modeling will be organized, under the instruction of Mr. F. Marion Wells, on the evening of February 13th.—Ed.) The motion to advertise the contemplated movement in this connection in the California Architect and Building News was unanimously adopted. The organization of classes in Drawing, Mathematics, and Carving will succeed that of Modeling as rapidly as circumstances will permit. It is hoped and requested that all students desiring to avail themselves of the valuable opportunities presented in the Chapter's efforts to benefit and perfect the young men in the profession will at once report to the Secretary, Mr. George H. Wolfe. There will be no charge to *articled* students; those who are not articled can also join the classes upon paying a nominal fee.

The articles appearing in the present issue, in relation to the appointment of "School Department Architect," and that in reference to this journal furnishing anticipatory reports of "contemplated improvements," were read and approved by vote of the Chapter.

The committee previously appointed to prepare amendments to sec. 832 of Civil Code, relating to the rights of coterminous owners, and the underpinning of buildings, reported that a bill, covering the ground, had been presented by Senator Cronan for action by the present Legislature, and is now pending.

Mr. Pissis read a very interesting address—subject, "Paris School of Designs"—which was ordered to be published in full in this journal. It will be found in another column. A vote of thanks was tendered him for his able effort.

A delegation from the Carpenters' Union appeared before the Chapter, specially in reference to the practice permitted by some of the architects in San Francisco of allowing contractors to sublet the finishing of buildings, in part or as a whole, by "piece-work," instead of having the work done by day labor. The unfairness and injustice of the custom was fully argued by the delegation, setting forth its injurious effects and tendencies as against worthy and capable workmen, many of whom were frequently thrown out of employment by reason of piece-workers offering to "lump" work at prices which would yield current day wages only by slighting the work, crowding in all the working time possible, and rushing it through with but little regard to quality of workmanship, thus debasing and demoralizing the standard of mechanical science, and working a common injury upon competent men, and imposing inferior work upon owners.

While the Chapter cannot control and prevent or regulate the questionable practice, the expression of all present disfavored the piece-work system. Many of the members of the Charter insert a clause in their specifications: "No piece-work will be allowed"; but this is harmless as against contractors who let piece-work when unaccompanied with a contract penalty. The agitation of the matter will, in time at least, induce all reputable architects to incorporate a penalty clause in contracts issued by them. The general sentiment of the members favored the adoption of some practical method calculated to favor the interests of the better class of mechanics. It was suggested to the delegation that the Union, from time to time, inform the Chapter of all cases of piece-work coming to its knowledge.

The meeting throughout was one of great interest, and members who failed to be present, and those architects who have not affiliated, missed the pleasures of one of the best meetings ever held by the architects of this city.

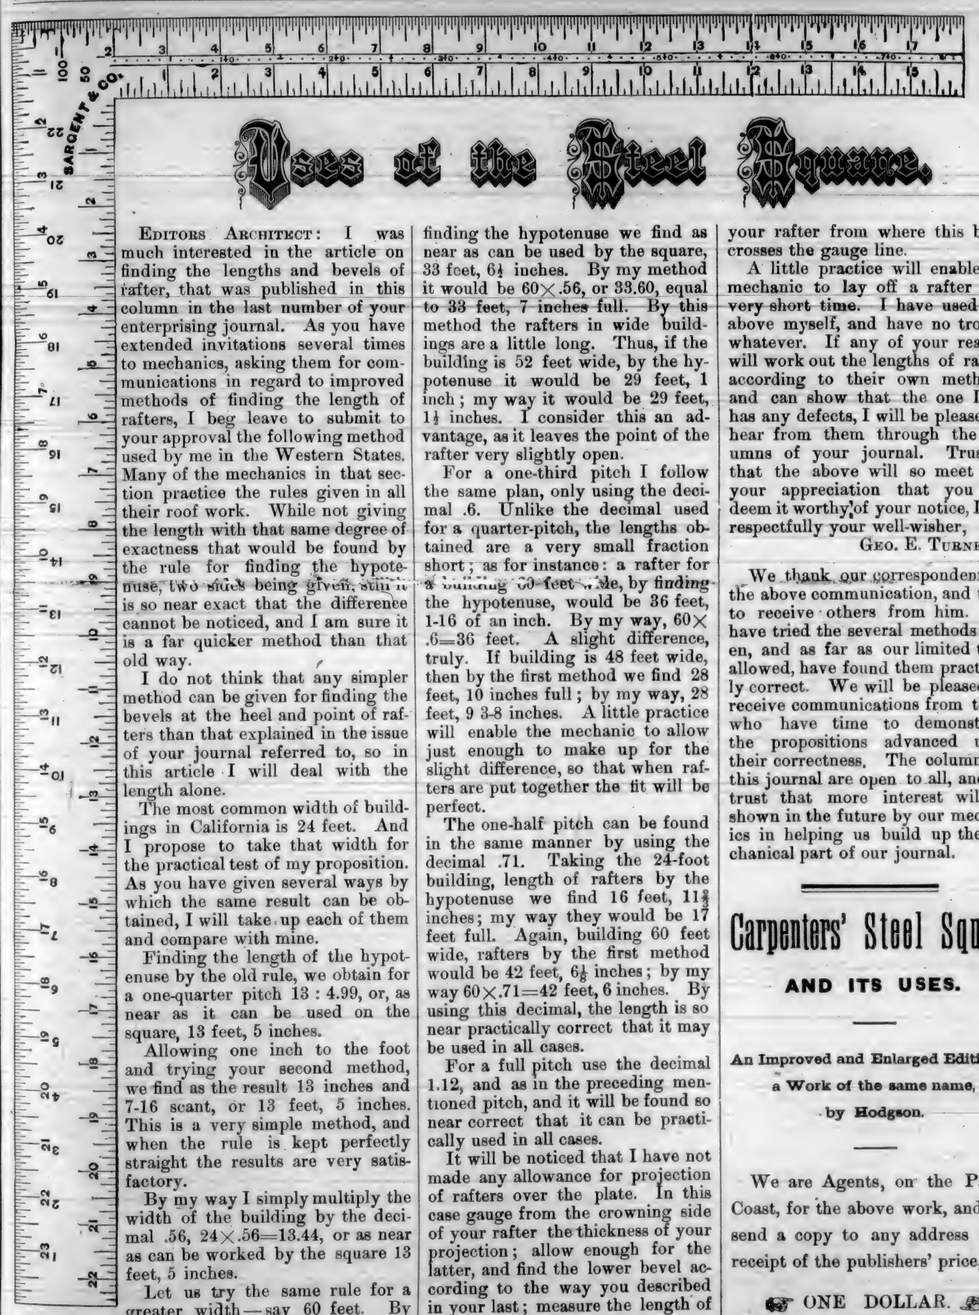
As Others See Us,

ESPECIALLY OUR ESTEEMED COUSIN, J. B.

Architecture has no status with Brother Jonathan, is not recognized as a profession, and is commonly reduced to the level of the signboard. The most highly educated men, therefore, do not become architects, and the result is plain. Whenever we find anything beyond the general run of indigenous wooden houses, it is usually of the most abject, commonplace kind, or a wonderfully ambitious failure. Whether in school-houses or in any other kind of structure, architecture in its highest æsthetic conditions is never found. Even the capitol at Washington, built of white marble, can, at best, be regarded only as a costly piece of architectural floundering. If, instead of parodying the styles of Europe, unsuitable both to the country and the people, American architects would as steadily set themselves to develop artistic buildings of their own (embodying, of course, the great fundamental truths which are present in all great architecture), in the same manner as American educationists have developed a school system, the result would perhaps be more respectable. Nor in the matter of scientific school-planning have they, as yet, done anything serious. Two rows of rooms with a corrider down the middle and a staircase at each end can scarcely be called planning. The German, in this respect, plodding heavily on, beats the quick American hollow, for in his school-houses every part of the fabric has its purpose as certainly as in any building of the thireenth or fourteenth century. This is the more remarkable because school building is no longer with Americans any new subject, and because in other walks their science holds its own. Fertile of invention, and quick to seize new ideas, they are usually first in the field with useful inventions, such as the sewing-machine (to quote one only among a thousand), yet their workmanship is never equal to that of England. America is striving to raise the quality of workmanship, and to manufacture within her own borders all kinds of things hitherto imported from Europe. To instance only one, carpets are now being largely made, and if English manufacturers do not yet know it, the fact will speedily be felt. In the struggle after science, good workmanship, and extended manufactures, one weak point has been keenly felt: America is profoundly ignorant of art. Further: she knows so much as to know her ignorance in this respect. Competition in all manufactures requiring artistic design (and what manufacture does not?) must result in failure if wanting in this initial necessity. Efforts are therefore now being made in the direction of art education with a purpose. This purpose is no other than the creation of a national school of designers who at all points shall be able to cope successfully with the artists of Vienna, Paris, and London. The movement has its beginning in Boston, where by good fortune one of the best English instructors in elementary art and design, Mr. Walter Smith, has been induced to settle. —*English School Board Journal.*

How It Works in New York.

The first case under the new plumbing law of New York came up in the Court of Special Sessions a few days ago. The defendant was John F. Crotty, of No. 232 East One Hundred and Twenty-First Street. The attorney who appeared in behalf of the Board of Health to urge the prosecution of Crotty stated that Crotty accepted the contract to do the plumbing for five houses at Alexander Avenue and One Hundred and Thirty-Fifth Street. The specifications approved by the Board of Health embraced basins properly trapped, house drains trapped at the sewer, and all traps ventilated by a pipe extending from the heel of this trap to the ventilating pipe running to and through the roof. Crotty, however, ran the pipe a short distance above the heel of one trap, and then terminated it, leaving the mouth open. He ran a branch waste-pipe into the room. The end of one of the large soil-pipes was left open in the celler, the opening being concealed by a beam. There were also many other serious defects in the plumbing of the houses. The connections had been made with iron ferules instead of brass or copper. In one case Crotty had sawed off pieces of lead pipe and used these sections as ferules. Some of the joints were left open, the pipes being merely telescoped into each other. At some of the joints putty was used, and at others putty and lead. There was not a properly arranged and set-up trap or connection in the whole five houses. Crotty acknowledged that he had violated the law, but urged that it had been at the instigation of the owner, who had provided the material, and ordered him to proceed with the work just as he had done. He said that he had worked with all his might to rectify his bad work, and put the entire plumbing in the houses in first-class order. He declared that he would not violate the law again knowingly or willfully. Justice Bixby said that Crotty was guilty of an act that secretly threatened the health and lives of any persons who might occupy those houses. He had made up his mind to send Crotty to the penitentiary, and inflict the full penalty of the law in case of his conviction; but the sanitary inspector had supported Crotty's statement that he was doing all in his power to remedy the evil, and therefore he should impose a fine of fifty dollars. This leniency would not be shown to Crotty again if he engaged in any more "skin" work, and no other plumber need be encouraged to attempt deceit in the hope of avoiding severe punishment. Crotty paid his fine and was discharged from custody. An equally effective exposition of the methods of the Crottys in every city would be a public benefit.—*The Sanitary News.*



Uses of the Steel Square.

Editors Architect: I was much interested in the article on finding the lengths and bevels of rafter, that was published in this column in the last number of your enterprising journal. As you have extended invitations several times to mechanics, asking them for communications in regard to improved methods of finding the length of rafters, I beg leave to submit to your approval the following method used by me in the Western States. Many of the mechanics in that section practice the rules given in all their roof work. While not giving the length with that same degree of exactness that would be found by the rule for finding the hypotenuse, two sides being given, still it is so near exact that the difference cannot be noticed, and I am sure it is a far quicker method than that old way.

I do not think that any simpler method can be given for finding the bevels at the heel and point of rafters than that explained in the issue of your journal referred to, so in this article I will deal with the length alone.

The most common width of buildings in California is 24 feet. And I propose to take that width for the practical test of my proposition. As you have given several ways by which the same result can be obtained, I will take up each of them and compare with mine.

Finding the length of the hypotenuse by the old rule, we obtain for a one-quarter pitch 13 : 4.99, or, as near as it can be used on the square, 13 feet, 5 inches.

Allowing one inch to the foot and trying your second method, we find as the result 13 inches and 7-16 scant, or 13 feet, 5 inches. This is a very simple method, and when the rule is kept perfectly straight the results are very satisfactory.

By my way I simply multiply the width of the building by the decimal .56, 24×.56=13.44, or as near as can be worked by the square 13 feet, 5 inches.

Let us try the same rule for a greater width—say 60 feet. By finding the hypotenuse we find as near as can be used by the square, 33 feet, 6½ inches. By my method it would be 60×.56, or 33.60, equal to 33 feet, 7 inches full. By this method the rafters in wide buildings are a little long. Thus, if the building is 52 feet wide, by the hypotenuse it would be 29 feet, 1 inch; my way it would be 29 feet, 1½ inches. I consider this an advantage, as it leaves the point of the rafter very slightly open.

For a one-third pitch I follow the same plan, only using the decimal .6. Unlike the decimal used for a quarter-pitch, the lengths obtained are a very small fraction short; as for instance: a rafter for a building 50 feet wide, by finding the hypotenuse, would be 36 feet, 1-16 of an inch. By my way, 60×.6=36 feet. A slight difference, truly. If building is 48 feet wide, then by the first method we find 28 feet, 10 inches full; by my way, 28 feet, 9 3-8 inches. A little practice will enable the mechanic to allow just enough to make up for the slight difference, so that when rafters are put together the fit will be perfect.

The one-half pitch can be found in the same manner by using the decimal .71. Taking the 24-foot building, length of rafters by the hypotenuse we find 16 feet, 11⅜ inches; my way they would be 17 feet full. Again, building 60 feet wide, rafters by the first method would be 42 feet, 6⅛ inches; by my way 60×.71=42 feet, 6 inches. By using this decimal, the length is so near practically correct that it may be used in all cases.

For a full pitch use the decimal 1.12, and as in the preceding mentioned pitch, and it will be found so near correct that it can be practically used in all cases.

It will be noticed that I have not made any allowance for projection of rafters over the plate. In this case gauge from the crowning side of your rafter the thickness of your projection; allow enough for the latter, and find the lower bevel according to the way you described in your last; measure the length of your rafter from where this bevel crosses the gauge line.

A little practice will enable the mechanic to lay off a rafter in a very short time. I have used the above myself, and have no trouble whatever. If any of your readers will work out the lengths of rafters according to their own methods, and can show that the one I use has any defects, I will be pleased to hear from them through the columns of your journal. Trusting that the above will so meet with your appreciation that you will deem it worthy of your notice, I am, respectfully your well-wisher,

Geo. E. Turner.

We thank our correspondent for the above communication, and trust to receive others from him. We have tried the several methods given, and as far as our limited time allowed, have found them practically correct. We will be pleased to receive communications from those who have time to demonstrate the propositions advanced upon their correctness. The columns of this journal are open to all, and we trust that more interest will be shown in the future by our mechanics in helping us build up the mechanical part of our journal.

Carpenters' Steel Square

AND ITS USES.

An Improved and Enlarged Edition of a Work of the same name, by Hodgson.

We are Agents, on the Pacific Coast, for the above work, and will send a copy to any address upon receipt of the publishers' price,

Patent Paints.

The modern system of compounding paint has adapted itself to the mercenary spirit of the age, and patent mixtures are most exclusively of this class. The new invention of a mode of mixing a particular paint has its origin in the brains of some mediocre duffer in pigment, whose knowledge is so meager that when the compound is made (not being aware of its chemistry), regards it as an original mixture, and forthwith has it patented. A wise man in ancient times said there was "nothing new under the sun," but in these days, if there is nothing new, there is a plethora of evolution that makes *new* developments. These cheapened crude paints are manufactured for the market, and are sent in trade all over the country, with flaming color lists, which attract the eye of the uninitiated, who buy them because the colored cromo list represents a better paint, and on these proofs only are these patented paints sold everywhere.

The following is a sample of late patents for roofing paint issued August 29th, 1882:

Claim—"The herein described composition of matter to be used for painting roofs of houses and iron fences, consisting of benzine, sulphate of iron, oxide of iron, asphaltum varnish, oxid of lead, Japan, burnt umber, hard rubber, bisulphate of carbon and coal tar, in the proportion specified." Another issued May 16th, 1882: Claim—1. "The herein described paint for roofs, consisting of a mixture of coal tar, turpentine, sulphuric acid and a suitable pigment material, substantially as herein described. 2. A composition for painting roofs, consisting of a mixture of coal tar, turpentine, sulphuric acid and asphaltum, when mixed in the proportions as herein described." In the claim noted first, there is nothing really binding except the rubber and coal tar, which, when well diluted by the benzine, would render it a fleeting mixture. The pigments enumerated form a singular body-guard quite too-too to need the superfluous support of asphalt varnish or Japan. It is very apparent that the vehicle to carry this heavy load of ingredients is too weak to bear the burden imposed, and when sublimated under a solar heat, the motor generated will cause the vehicle to travel like chaff, and even to fly before the wind from all metallic roofs, and be of little use on any other surface.

The latter claim quoted is even more vile, its binder consists of coal tar of no permanent value, and when attenuated with spirit of turpentine, will soon vanish under ordinary temperature. Another patentee claims to originate a coating mixture for all exterior surfaces, as the following will show: "I claim the improved process of covering exposed surfaces or walls, consisting in first coating said surfaces or walls with the described mixture of pulverized gypsum and glue, and then painting them substantially as described." All dope mixtures of this and similiar nature have been in use for scores of years (without a patent), and many of them far superior to this one. And what is true of one is the virtue of all, they all need subsequent *substantial* painting. Their only use is to cheapen the work, and it generally does this effectually, for the painting that follows such primings is not homeogenous, and therefore they will not combine and form a solid permanent surface coating. There are no glue preparations for outside work that will stand like the oil, the pure linseed oil priming which dries firm, and is the foundation for all kind of work that needs to be honestly done. The cheap patent mixtures are generally for the use of contractors for doing work under price, and the work is patent, for it speaks for itself, it needs no advertising. The fictitious paste paints in vogue are made for the general public and country dealers. This class of goods are wholesaled at figures that offer great inducement for buyers to stock their stores with them, being fully assured of much larger returns for their investment. Merchants who deal in these patent paints wink at the gullibility of the public buyer, and smile blandly over their profitable sales. Painters who have served an apprenticeship to their trade do not need these bogus paints for to do good, creditable work at painting. He needs only pure lead and oil, which forms the basis of all colors and shades needed in house-work. The modern chemist has not improved on these, and failing to do that, has often assisted and has made formulas of soluble mixtures and silicate pastes, as substitutes for reliable paints. There are wants it may in its purer silicate form serve to fill, but as a substitute for white lead it is a failure. It is claimed that the silicate combination with sulphate of baryta forms a fine white paint, yet the tendency to use water freely makes it unfit for wood, while it may answer for textile fabrics, card-board, etc. The sulphate of baryta is now very generally employed in the manufacture of cheap white paints ground in oil, and pass under a multitude of brands as pure white lead. As a white paint, it is inferior in every way as to body or covering quality, yet compounded with it makes a very serviceable paint, and may be used as a priming for all classes of cheap work. The so-called permanent white or artificial sulphate of baryta is one of the compounds of liquid glass, and under the name of blancfix, it is used by card-makers, paper stainers, and paper collar manufacturers to a very large extent. The advocates of these and other patent paints say with truth, that lead paints are more deleterious to health than the new compounds. Yet while we admit that, we do not concede any equality to liquid or soluble glass mixtures with the former. The artificial sulphate is obtained from native minerals, such as heavy spar, witherite or carbonate of baryta, and when manufactured produces a fine white pigment. This substitute, when mixed with dextrine, starch, or other binding material in connection with the liquid silicates of soda, offers a paint of a fire-proof nature, free from the odors of linseed oil, lead, or turpentine. A paint of this kind should be employed in painting the casings of elevator shafts and the wood-work of sleeping-cars; it would burn less rapidly if tinted with such a coat of fire-proof material, and thus give more time for the rescue of human life.

J. E. W. C.

A New Floor Covering.

A new and desirable papier maché process for covering floors is described as follows: The floor is thoroughly cleaned. The holes and cracks are then filled with paper putty, made by soaking newspapers in a a paste made of wheat flour, water and ground alum, as follows: To one pound of flour add three quarts of water and a tablespoonful of ground alum, and mix thoroughly. The floor is then coated with this paste, and then a thickness of manilla or hardware paper is put on. If two layers are desired, a second covering of manilla paper is put on. This is allowed to dry thoroughly. The manilla paper is then covered with paste, and a layer of wall paper of any style or design desired is put on. After allowing this to thoroughly dry it is covered with two or more coats of sizing, made by dissolving one-half pound of white glue in two quarts of hot water. After this is allowed to dry, the surface is given one coat of "hard oil-finish varnish," which comes and is bought already prepared. This is allowed to dry thoroughly, when the floor is ready for use. The process is represented to be durable and cheap, and, besides taking the place of matting, carpet, oil-cloths or like covering, makes the floor air tight, and can be washed or scrubbed.

Prospects for the Season.

The inquiry, "What are the prospects for the season?" is repeated by thousands daily. All are anxious to learn the general condition of things at present concealed within the womb of the future, to be known only as brought forth and developed day after day. None are so wise as to be able to tell with certainty what is to be; but it is possible to judge of the future probabilities by the "signs of the times." Taking these as a guide, it is but reasonable to say that the future promises well, except so far as the general interests of the State may be adversly affected by insufficiency of rain. At present, the supply is unusually short, and unless, within the present or next succeeding months, increased quantities of rain descend, short crops and diminished expenditure in improvements are sure to follow

Aside from this, all indications are favorable, and the general expression on all sides is, that a prosperous year is before us. As will be seen by our monthly reports, the number of building contracts let during the thirty days prior to January 15th far exceeded in number the report for the same period in 1882; and the report in present issue shows a large increase over our February report of the past year, and from all the facts within personal knowledge, and from information possessed, it is safe to predict, all things being square, an increase in building activities over the last past very prosperous year. In our November issue we expressed our fears of a "dry season," and regret that so far the rains, upon which the prosperity of the State so largely depends, have tallied with the indications upon which we based our surmises.

How Hinges and Other Articles are Polished.

Common articles of hardware, such as screw eyes, hinges, handles, etc., are polished by tumbling in a revolving barrel. The tumbler is charged about half full with the goods mixed with the material selected according to experience as best suited to do the work. Small scraps of iron, sand, and gravel with the attrition of the metal take away the roughness and put a moderately smooth surface to the work. Then charge the work into a tumbler partly filled with leather scrap or skivings cut fine, mixed with crocus or almost any fine polishing powder; after which it can be cleaned and brightened by an additional tumbling in sawdust and lime. The above is a general feature of this kind of work. Almost every manufacturer has some peculiar system of management suited to the special kind of work made. Some use oil or water, then boil the work in lime water, and again tumble in sawdust to dry and brighten. The black oxide of iron (anvil scales) is much used where it can be had. A little plumbago is sometimes thrown into the tumbler to give the work a shining black surface. A strong barrel or keg on trunnions, with a small door for charging, is most suitable for small, light work.

Much work that has a fine finish upon the surface is polished by boys, who handle the individual pieces against a large brush wheel with crocus or whiting. With a large wheel, the process is so quick that a boy will run through with many thousand pieces in a day.—*Scientific American.*

TWO ELEGANT RESIDENCES FOR SALE, located in prime localities. One with lot 137 feet 6 inches frontage, by 120 feet deep, $75,000. The other, half 50 vara lot, with a fine residence in splendid order, $18,000. The surroundings in both cases unexceptionable. Inquire at the office of this journal.

On House-Designing.—From an Old Work.

"No art without a genius will avail,
And parts without the help of art will fail."

"Rural architecture is not only one of the most pleasing of the useful sciences—termed the 'art of necessity,' in contradistinction to sculpture and painting—but it may be esteemed the most extensive in fancy and design, requiring great taste and good judgment to compose the parts of which it consists, either in respect to a regular, systematic uniformity, or a picturesque composition, and to harmonize and combine the different masses with the surrounding scenery, or local objects on the spot.

"To be successful in these, the architect must have a mind well stored with discrimination, and possess a fertile imagination as well as a playful fancy, to enable him to diversify the effect by light, shadow, and middle tints, and to preserve the analogy of design so as to produce a pleasing effect to the eye, either in its natural simplicity, or when more elegantly decked with ornamentations.

"To design a country seat or suburban villa that will at all times attract attention and admiration, it is requisite that the architect should possess and exercise good taste as well as good judgment and inventive powers, which implies also a general perception of the whole design, the application of the several parts, and such as are the most fitting, beautiful, and appropriate. In order to accomplish this, the architect must possess a great knowledge of the various forms in architecture, and be enabled to bring them to his aid, as well as to diversify and have the art of applying and harmonizing these parts into pleasing effects. However simple a residence may be intended, it nevertheless admits of beauty as to form and proportion of parts; in fact, beauty becomes the grander when found in simpler forms, and is but seldom considered in connection with largeness and massiveness. When we refer to the large and powerful horse, it is that he is a noble animal, although enjoying all the splendor of fine proportions and form, while the pony or lighter-framed roadster become the object of special admiration for their special beauty. The eagle is spoken of as the majestic bird that soars above the howling storm, and floats upon tireless wings in midheaven, while the tiny songsters of the forest are admired and petted for the beauty of plumage and form, and the sweetness of their bird songs. The same applies to an edifice; we say that is a noble mansion, while this is a pretty cottage or a beautiful residence. In designing a dwelling, it does not depend upon or require a profusion of oranments to constitute the beautiful, but often the reverse; for simplicity and taste, which are so difficult to obtain, are closely allied, and the most tasteless designs are generally the more expensive, from the great quantity and heavy mass of material required. In others, again, a redundancy of angles and grotesque forms, with which, in architectural phrase, some houses are overburdened, being crowded with inappropriate or unmeaning ornaments, is a sure indication of a low order of architectural imagination. Architects should bear in mind that whatever is ornamental should be useful. It is use alone that sanctifies expense."

Accepting the foregoing as the correct theory in house-designing—and such it is in fact—a large proportion of the habitations of mankind at the present time are architectural failures. One may stroll through the cities and towns of the present day, and find in the constructions of latter years as much to condemn as to admire in the display of architectural efforts; and in villages and country districts only here and there cottages and country residences entitled to consideration among the beautiful; and the question naturally arises, Why is it? Is the science of architecture retrograding, and has time, experience, and the examples of ancient illustrations produced architectural degeneracy? Judging the matter by the manifest lack of architectural skill displayed by thousands who work their way into the practice of the profession, with but fractional and incidental parts of an architectural education, such a conclusion is not unreasonable; and it is in the fact that such men are liberally patronized by owners that the architecture of the present day is rendered the subject of so much adverse criticism; and it is to be regretted that the lesser class is so often preferred to those who so well and worthily fill the places made vacant by the passing away of the truly competent and qualified men of former years. That which, more than anything else, has stimulated and encouraged present seeming degeneracy, has been the penuriousness or false-economy notions of owners, in accepting the services of architectural pretenders at cheap rates, rather than pay trustworthy and competent men fair and just compensation for faithful and intelligent service.

One Reason why Plastering Cracks.

CHARGE THE FAULT WHERE IT BELONGS.

Often enough, without doubt, the masons are in fault, but far oftener plastering cracks and falls because the carpenter has failed in his duty. Even poor mortar will remain unbroken upon a rigid wall, but the best possible composition of lime, sand, and hair will quail and crumble before the shrinking of sills and floor joists, the warping and twisting of studs, and the failure of furrings to hold their place. As a coat of plastering is not absolutely inelastic, the slight bending of joists in upper floors is not sure to cause visible cracks in the ceiling below, but the settling of any part of a partition will certainly be followed by zigzag cracks that usually indicate by their course where the weak spot is to be found.

An almost universal cause of these ugly blemishes is the joining of the masonry and wood-work, as in the case of outer brick and stone walls inclosing partitions of wood, or where chimneys pass up through the frame around them. If properly constructed and resting upon solid foundations, the brick walls and chimneys are immovable. Saving a very slight settlement when they are carried up high and rapidly, they never change; but the wood that joins them, unless thoroughly seasoned—which happens "almost never"—keeps steadily changing its size and shape for a year or two at least, and possibly for a score of years.

A simple illustration of this incompatibility of wood with brick and stone work will suggest to thoughtful builders the difficulties and dangers from this source. By the ordinary modes of construction the outer ends of the joists and floor beams of a brick building rest in the walls and never more; the inner ends, if the building is too wide to be spanned by a single length, rest upon cross beams supported by posts and studs. Even if these cross sills and beams are partially seasoned when the walls are plastered, age and artificial heat will cause a considerable shrinkage in their depth, and this, of course, lets the inner ends of the partition walls, especially in the upper stories, down towards the cellar. It may be only by the smallest fraction of an inch, not enough to visibly affect the floors or wood finish, but it is easy to understand how much a settlement must affect the easily fractured sheet of mortar. The greater the number of stories—that is, the greater the aggregate depth of the horizontal timbers used for support—the greater will be the depression of the upper floors in the central parts of the building and the wider will the cracks yawn upon the walls. When the joists are laid upon a beam passing wholly beneath them, the allowance for shrinkage must be proportionately greater.

As there is no appreciable shrinkage in the length of straight-grained timber, similar results follow from an unscientific combination of horizontal timbers with the vertical studs and posts. Thus, if the outside studding extends the entire height of the walls, resting perhaps on a thin sill lying flatly upon the stone underpinning, while the partition studs are cut off at each story, and stand upon deep joists or beams, it is also inevitable that the partitions shall settle and spring to such a degree as to *tear* the plastering, and afterwards wrinkle the paper that is put on to cover the cracks. As to chimneys, it is difficult to find a frame house, however carefully built, in which they are not surrounded by cracks running out like branches from a dead tree, and these cracks usually run in such directions that they would appear to have been caused by raising the chimney slightly after the house was built, which is precisely the case; relatively to the house the chimney does rise very slowly until all the joists, sills, and horizontal beams have shrunk to their smallest dimensions, and have finished sagging and bending around the hearths and fireplaces.—*The Builder.*

Light Basements or Cellars.

Accepting the invitation of Messrs. P. H. Jackson & Co., we made personal examination of Mr. Somer's new building, on Market street, opposite Dupont, and were not disappointed in finding a handsomely lighted cellar, in which, although its length is 165 feet, we found fully one-half of the entire space sufficiently illuminated during working hours for all mechanical purposes. This is attained by the omission of all obstructing brick piers at front wall, and the introduction of ample sidewalk lights, of Hyatt's patent, for which Messrs. Jackson & Co. are the agents, the structure being further sustained over the openings in front wall by the use of the Franklin girder, which, for strength and utility, will bear the severest criticism.

The building throughout reflects great credit upon the architect, Mr. Moore, who has displayed good architectual abilities in its arrangement, construction, and lighting. There is not a poorly lighted spot within the walls in either story, while in strength of construction it is faultless. The good judgment displayed in not overburdening the roof with unnecessarily heavy, clumsy timbers is commendable, and some of the older heads in the profession, who conceive the illogical notion that great bulk of material in the construction of roofs is a necessity, will find the illustration a sufficiently strong roof for all practical purposes, even that of sustaining four feet of snow, should that quantity ever happen to fall in San Francisco. It is old fogyism exemplified to use more material than the purposes of use require for any purpose.

Saw-Mill Directory.

We have received from the N. W. Lumberman a copy of its Saw-mill edition. It contains 212 pages, giving a complete list of the saw-mills in operation throughout the United States. Pennsylvania heads the list with 1,291, Arizona has the least—8. In the United States there are a total of 15,020. Some idea of the amount of work done by N. W. Lumberman in its compilation of the above number of mills may be had by saying that it gives the number of mills in each county, in each State, with the name of the owner and the kind of wood sawed by the mill. We will take pleasure in showing this splendid edition to any one who calls. No extra price is asked. Subscribe for one year, and once during that time at least you get a copy such as the one on our table.

Ecole des Beaux Arts.*

Gentlemen—Since the interest of the Chapter has been aroused in reference to architectural education, and as we are all gradually awakening to the growing necessity of possessing in our midst a school for the purpose of educating our young men who desire to devote themselves to the study and practice of our profession, it will be useful and interesting to review and study carefully the methods of instruction pursued in different countries; to select from each what is conducive to improvement in architectural studies, as far as it can be applicable to our own limited means and numbers, and to discard that which we consider useless or injurious.

Among the art schools which are justly celebrated, the *Ecole des Beaux Arts* of Paris occupies a prominent place, and its architectural department will form the subject of my address.

The ultimate object of architecture is to erect buildings which are not only well and solidly put up, conveniently disposed for the objects for which they were intended, but they must also produce an agreeable impression upon the spectator, and conform with our ideas of the beautiful.

In order to attain these desiderata, the architect must be well acquainted with mathematical and natural sciences; he must possess a thorough knowledge of the properties of the materials employed—their qualities and cost; he must be quick in designing, skilled in the use of the pencil and the brush; he must also be conversant with the history and literature of the civilized world, in order to be acquainted with the styles of the different epochs and nations, and with the æsthetical and constructive reasons which led to the formation of such styles.

Therefore, a school of architecture, in order to be complete, must be so arranged as to afford the student facilities to obtain a knowledge in all the branches which I have just mentioned, and the Paris School of Fine Arts admirably fulfills these requirements.

Founded in the latter part of the seventeenth century, under the reign of Louis XIV., it has undergone several changes as the necessities of the times demanded. It has increased to such a degree, and its fame has become so great, that all the art schools in France have gradually become simply preparatory schools to this great institution, which numbers about twelve hundred students, four hundred of whom are architects.

Placed under the generous patronage of the Department of Fine Arts, it is liberally endowed with everything which can improve the artistic taste of the student, with large and spacious studios, handsome courtyards containing statuary, fragments of architecture, fountains, etc., museums of copies of the most celebrated works of art, both of painting and of sculpture, full-size columns and entablatures of the temples of Greece and Rome, entire fronts of the castles of the Renaissance—in fact, with everything calculated to inspire the youthful mind with noble examples of true art. It possesses a library second to none in artistic works, old etchings, photographs, coins, medals, etc.; and in the immediate neighborhood the student can avail himself of the vast collections of Louvre Museum.

Pupils are admitted to the Section of Architecture of the *Ecole des Beaux Arts* upon passing a successful examination in mathematics and history, and in ornamental or free-hand drawing; they must also be sufficiently well acquainted with the principles of architecture to enable them to make a finished sketch in twelve hours upon a given subject, such a sketch must bear evidence of a general knowledge of proportions, skillful drawing, and adaptability to the subject proposed. The school is free to all, Frenchmen and foreigners alike, without any fees for lectures or examinations, or expenses of any kind. Once admitted, the student may take part in all the competitive designs and follow the different courses, which include Analytical Geometry, Surveying, Descriptive Geometry, Perspective, Stone-cutting, Chemistry, Physics, History, and lastly, strength of materials, theoretical and practical construction.

The pupils select their studios, at the head of which is a professor who comes two or three times a week to direct them in their work and advise them in reference to their productions. The studios are not divided in accordance with the advancement of the pupils in classes, but each contains among its members from the mere beginner to the skilled and already well-known student endeavoring to obtain that highest honor in the gift of the Academy of Fine Arts, namely, the Prize of Rome. This system of bringing together students in different degrees of advancement affords opportunities for considerable interchange of knowledge and ideas.

The students are divided into two classes—the first and second class. They enter the second class upon their passing the necessary examinations for admission. In order to become a member of the first class, the student must have passed all his examinations in the scientific courses upon all the subjects I have already mentioned, and he must have obtained six honorable mentions in the bi-monthly competitive designs, the minimum time that can be passed in the second class before promotion to the first class being two years. The first class devotes itself entirely to competitions of the most important character, and, necessarily, of more artistic value and merit.

The manner of conducting these competitions is, I believe, peculiar to this school, and it is to their fairness, and the emulation which they encourage among the students that this school owes its success. Once every two months the students assemble in a building adapted for that purpose, containing a large number of cells. Each student signs his name on a register, and receives in turn a copy of the subject of competition—the programme, as it is called. Then he retires to the cell bearing his number. There he has twelve hours to finish a sketch of the design answering the requirements of the programme. A tracing of the sketch is taken, and the original left in the hands of the secretary, by whom it is filed. The student has two months to study up his idea and to produce a finished design, in the production of which he is greatly aided by the hints and suggestions of his professor. Upon a certain day at the end of the two months, all the designs are taken to the exhibition hall and hung up for public inspection. The next day the jury, composed of all the professors and other leading architects of Paris, assembles. The original sketches having been attached to the respective designs, the jury begin by eliminating all the productions which have not retained the main features of the original idea, and rewards are given to the most meritorious of the remaining designs, the number of rewards not being limited except by the merit of the compositions.

In addition to the architectural competitions and examinations in the scientific department, numerous free-hand drawings from the cast are required from the student.

The greatest liberty is given to the pupils to enable them to advance with rapidity in their studies. There is no compulsion to attend the lectures, no roll-call at the studios, every one follows his own inclinations, and every opportunity is given to the bright and studious to push ahead without interfering with their less fortunate and talented school-mates; by such a system every one feels a certain responsibility and learns to take pride in his own achievements. The frequent competitions and examinations keep the young artists constantly on the alert, and although the rapid advancement of some may discourage the indifferent or incapable ones, it presents a continual incentive to the ambitious and studious.

The most important of all the competitions and the only one to which foreigners are not admitted is the annual competition for the *Grand Prix de Rome*, which entitles the successful candidate to a pension for four years from the Government, with the condition of his studying his art abroad, mostly in Greece and Italy, and of sending every year the product and results of his work. Most of the eminent French architects, painters, and sculptors have obtained this prize.

The sections of painting and sculpture in the school are arranged on a similar basis as that of architecture.

The School of Fine Arts has been very much criticised for not even attempting to teach the young architect the actual practice of his profession. These criticisms are, in my opinion, unfounded. The real practice of architecture cannot be taught in schools, but must be acquired slowly by personal observation and experience, and this institution is so arranged that, without materially interfering with his studies, the student can readily accept positions from the government as sub-inspectors in public buildings, or situations as assistant to the numerous architects who are always glad to obtain the services of skillful draughtsmen understanding thoroughly the theory of construction and its necessary calculations.

I have endeavored to give as briefly as possible a general idea of the workings of the section of architecture of the *Ecole des Beaux Arts* of Paris, whose object has always been to give full scope to the individuality and originality of each of its members, to afford them every opportunity to acquire the knowledge of all that may interest the architect, and by a perfect system of examinations and competitions to reward the talented and industrious, and to encourage all in the desire of becoming worthy members of their profession.

ALBERT PISSIS.

* Speech delivered before San Francisco Chapter of Architects, by Albert Pissis, Esq., member Ecole des Beaux Arts and S. F. C. A. I. A.

Finical Finish.

If mechanics generally realized how much labor is lost in the mere ornamentation of useful tools, they would discourage it in their own practice, and in their patronage of the manufacturers. There is a grateful sense of beauty in a well-finished tool, but to the mechanical eye this finish is more in good proportion and adaptability to use than in meretricious ornamentation.

There is much time wasted in the shop by foolish experimenting to ascertain how much of fantastic "giggering" can be crowded in a small space on a bench implement. A simple scratch awl, that should be at best but a rod of quarter-inch octagon Stubs' steel, tempered and sharpened, is sometimes so crowded with filed facets and clamp-turned beadings as to become a most unhandy tool.

Sometimes more glaring substitutions of finical finish for useful form are noticed. The employment of the knurled-headed screw, or the knurled nut, for a thumb screw, or "butterfly" head screw and nut, is very common. The knurled head or nut can be formed in the lathe, and presents an elegant appearance, and it may readily be turned off a bar or rod without the previous work of forging. But when done, its entire leverage depends upon the squeezing power of the thumb and forefinger, the corrugated edge of the nut or head bedded in the tender flesh of the balls of the finger and thumb. The butterfly thumb nut must be forged, but this is no objection when these nuts and screws may be bought by the gross, drop-forged, and in just the condition for final finish. These nuts and heads are elegant and easy to handle, and, mechanically considered, are quite as ornamental as the knurled nuts.—*Scientific American.*

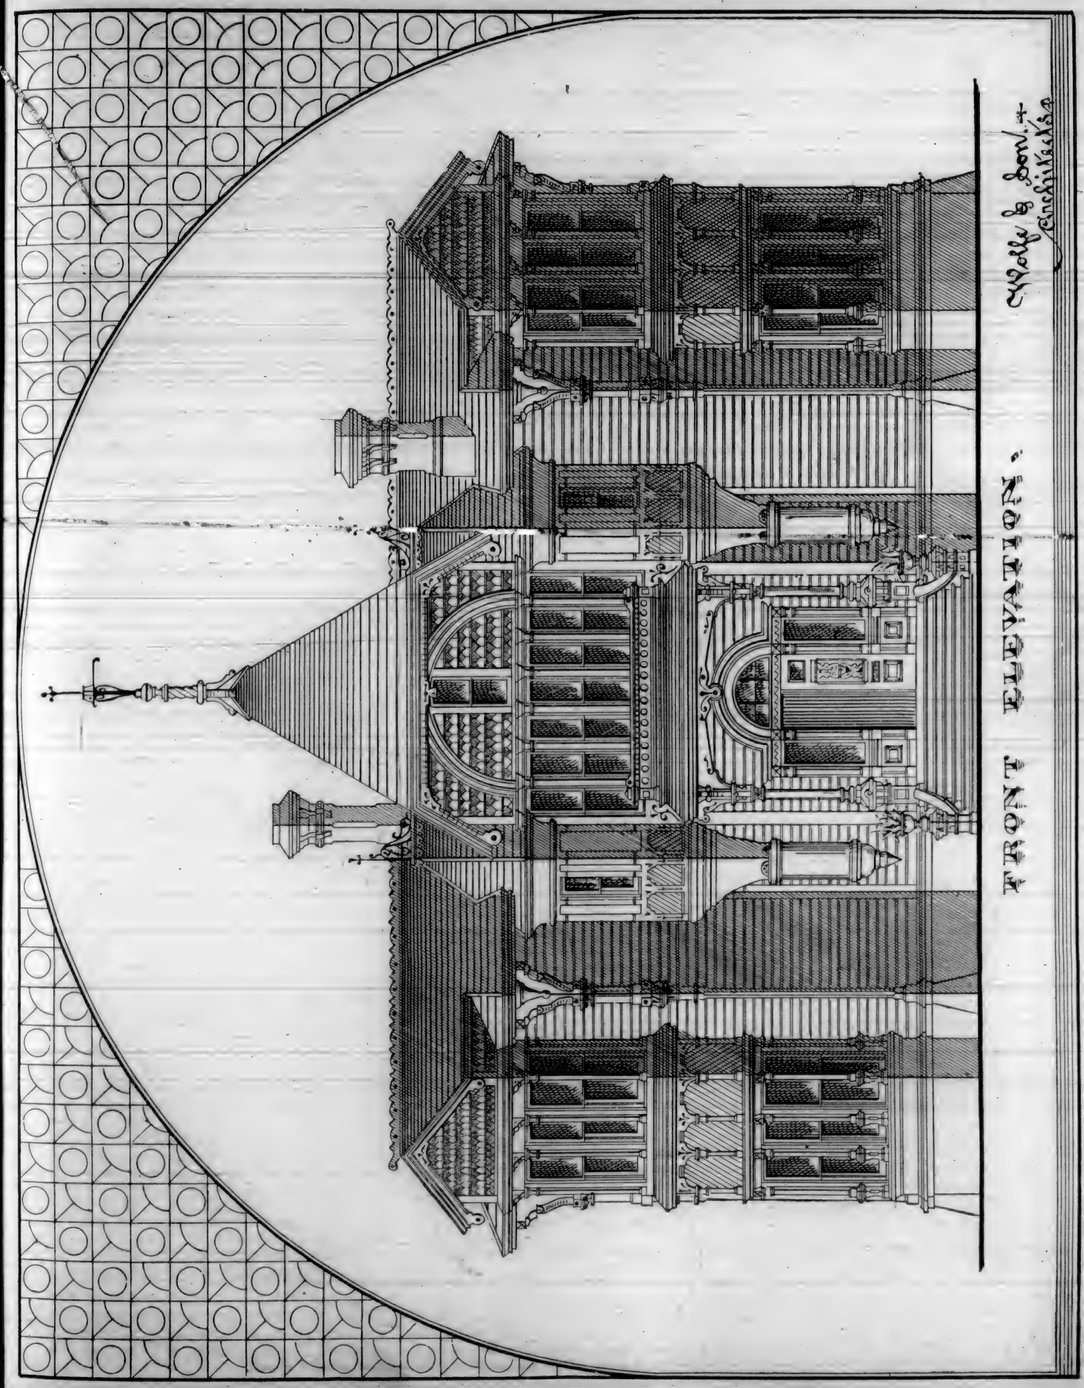

PLATE 1.—FRONT ELEVATION OF A COUNTRY DWELLING COSTING $10,000.

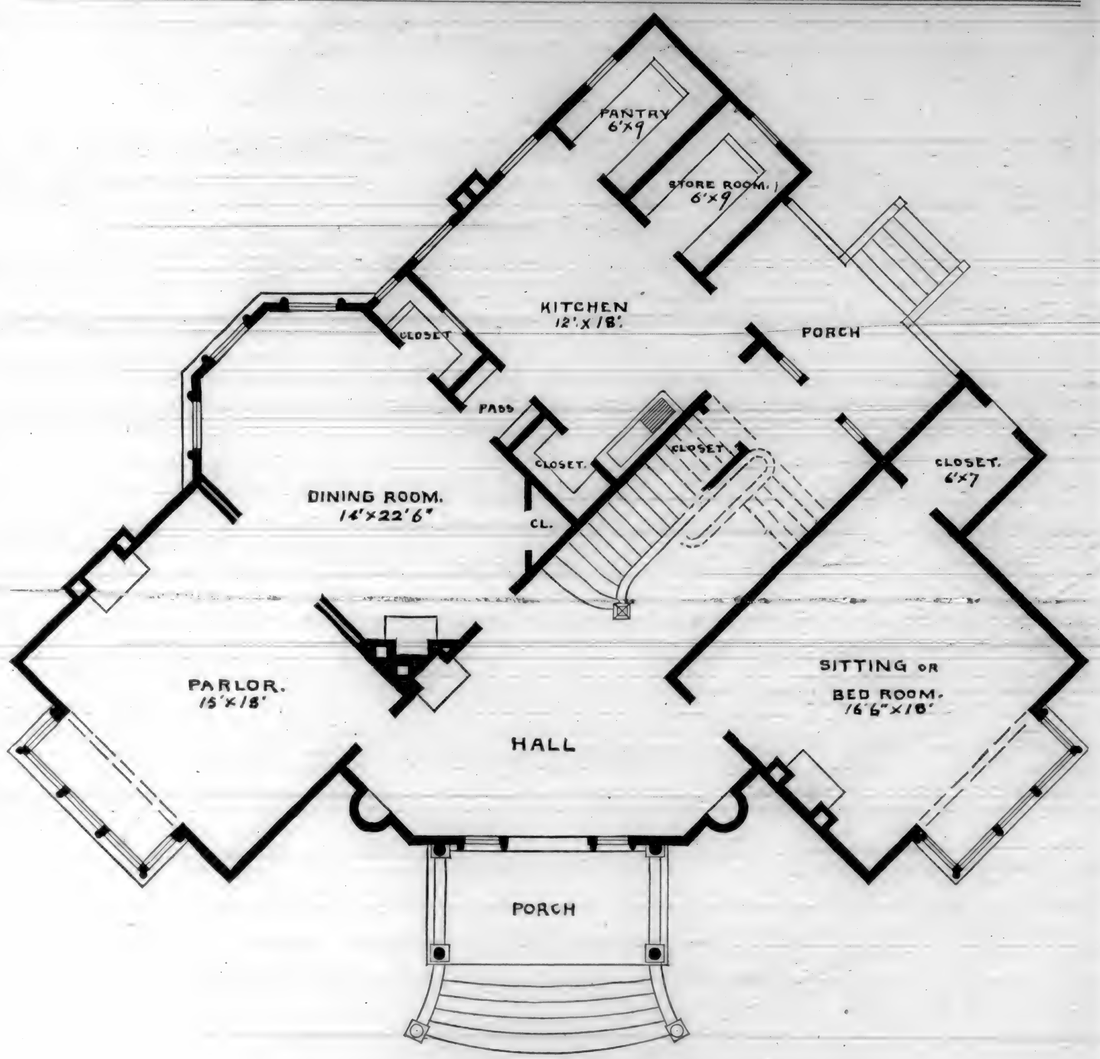

FIRST FLOOR PLAN

PLATE 2.—PLAN OF COUNTRY DWELLING COSTING $10,000.

All Over and Around the Country.

In the issues of January 20th and 27th, the *American Machinist* has given two pages in each number, of letters from leading manufacturers of the country, embracing every article connected with the mechanical trades. From the letters we should judge that an unusual steady activity is manifested from every section of the country, in regard to the supply of orders on hand and those sure to come in the future. As a rule, prices are not as high as they might be, but every one seems to be satisfied. The plain, practical, common-sense, "to the point" style of writing of the editors of the *Machinist*, has evidently taught their correspondents to follow their example, as all the communications are concise, and in as few words as possible explain the true state of the market. We would advise all our machinists to send after copies of the above dates, or better still, $3.00 for a year's subscription.

For Fence Posts.

A writer in an exchange says: "I discovered many years ago that wood could be made to last longer than iron in the ground, but thought the process so simple that it was not well to make a stir about it. I would as soon have poplar, basswood, or ash as any other kind of timber for fence posts. I have taken out basswood posts after having been set seven years that were as sound when taken out as when first put in the ground. Time and weather seemed to have no effect on them. The posts can be prepared for less than two cents apiece. This is the recipe: Take boiled linseed oil and stir in pulverized coal to the consistency of paint. Put a coat of this over the timber, and there is not a man that will live to see it rot."

Indexed Atlas of the World,

Beautifully bound in half morocco. This splendid work is only sold by subscription. The edition is now almost exhausted. But one copy remains. We will forward it to any address upon receipt of $35.

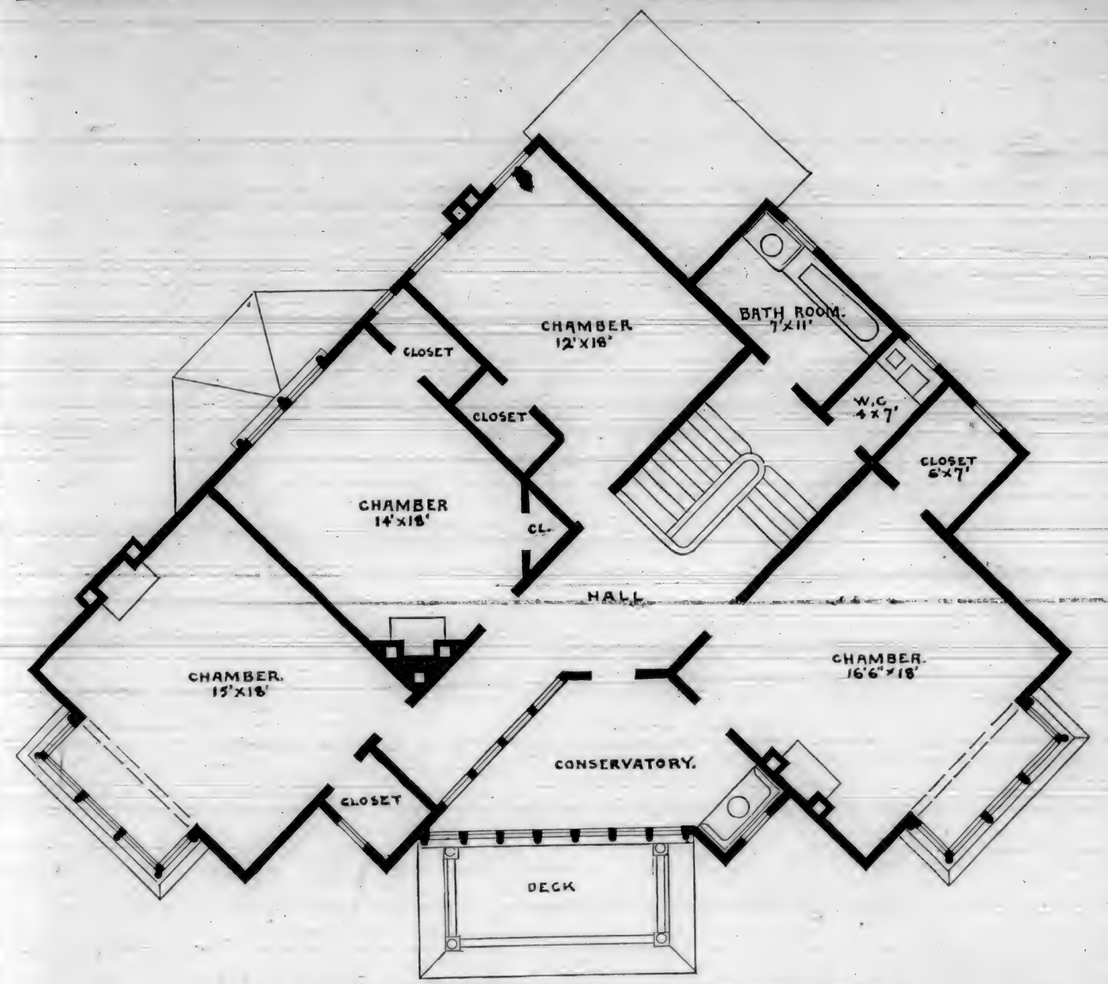

PLATE 3.—SECOND STORY PLAN OF COUNTRY DWELLING COSTING $10,000.

Queen Anne Houses.

There is no distinct American architecture at present, but the country is fast approaching that development which will produce it. Our habits and ways of living are so much like those of the people of Europe that we have adopted their styles, and we show here every feature of the different houses of the old country mixed up together. All of these styles are now in a grinding state, and just as people from all of the nations of Europe are being ground up into characteristic Americans by our ideas and surroundings, so will in time these different styles, affected by our habits, ideas, and surroundings, grind out into something new, distinctively American. As it is, the American dwellings are modeled after the European villas. Abroad this style is used only by the wealthy, but we have modified it, and have adapted it to the residences of the poor as well. The architecture of a country or an age is the outgrowth of the necessities and habits of the time. You must consider the surroundings before you build. A house that will look well on a hill surrounded by trees will not suit at all a location on a plain; and a villa in the country should be radically different from a structure located amid the bricks and mortar of a large city. The habits of the people demand different houses now than they did one hundred years ago; and of all the absurdities of modern house-building this attempt to push in the Queen Anne style of 1700 is the worst. The Queen Anne houses are not at all adapted to the times, and their absurdity has already begun to appear. In New York the style has fallen into discredit, and it will soon be as universally distasteful as it was a year ago universally popular. The Queen Anne houses will become a drug in the market, and they will depreciate the property on which they are located. They are not healthy. Their ceilings are low, and their interiors so constructed as to be ill ventilated and poisonously unhealthy. The laws of hygiene were comparatively unknown when Queen Anne lived, and the economy of warming the houses was a great consideration. Their huge fireplaces acted as ventilators, and the homes of that day were not as badly ventilated as their aped counterparts of the present. Had they possessed furnaces, gas, and plate-glass, they would never have lived in such houses. The whole style is against the dictates of common sense. The houses are a disgrace to the intelligence and taste of the country, and their costly diamond-shaped windows are only a phase of the craze for the old and ugly which has swept over America. In two years hence the style will be discontinued in the smaller cities as it now is in the larger.—*Cleveland Leader.*

The new city hall in Philadelphia contains 57,000,000 bricks, and is the largest building in the country, occupying considerable more ground than the Capitol at Washington.

Building Improvements.

THE GENERAL OUTLOOK IN THE STATE.

For ten years building improvements throughout the State have not been so brisk as they have been in the year just passed into the lapse of time. There is not a county in the State that has not been blessed with a number of goodly building improvements. Especially is this noticeable in the counties fronting on the bay. In our own county, we have given a full list of the buildings erected during the year.

Alameda County stands at the head of the bay counties in the number and value of building improvements. In the town of Alameda, buildings have been erected of the value of about $250,000. Very few single buildings cost over $5,000, the majority averaging about $2,500. This fact shows that the town is steadily increasing in permanent population, and is a sure index of a healthy and steady growth. By the way, we sincerely hope that the citizens of this enterprising village will not allow themselves to be "combined" with their sister city. Oakland seems to have aroused from the lethargy of the past few years, and her inhabitants seem waking up to the fact that it is no longer desired to be called the "suburb of the bay city." The establishment of the Judson Nail Factory in West Oakland has been the means of building up quite a town that formerly was considered out of the way. Various other enterprises are contemplated, which when built will cause the western section to teem with life. The improvements during the year figure up about $400,000. In giving the value of improvements we do not in any instance figure in the value of machinery.

Many substantial improvements have been made throughout Contra Costa County. The adaptability of a goodly portion of the land to the culture of the grape has led capitalists to invest large sums of money in their culture. A large wine cellar has just been completed near Clayton, and another one is talked of in the neighborhood of Pleasanton and Livermore. The establishment of a shipping point at Port Costa has caused a large portion of trade to be diverted to that place, and has caused quite a town to spring up, in addition to the many large granaries erected.

We cannot say much for the improvements in Solano. The establishment of Baker & Hamilton's factory at Benicia led many to believe that a new era was to dawn upon that town. Very few improvements have been made, however, and the town is still just a way station. Around Suisun many substantial dwellings have been erected. Taken as a whole, the buildings in this county are not such as to dazzle the eye of an experienced architect or builder.

Napa has kept well in the lead—in fact, we can say ahead—of her sister counties. All through the valley, one is struck with the numerous evidences of thrift. New houses are met with on every side, and from inquiry among the real estate dealers, we are assured that the improvements this year will far outnumber those of 1882. The great success of this valley lies in the fact of its small farms and vineyards, and the improvement of each one by its owner to the full extent of their means. Very few buildings have been erected costing over $5,000; the principal ones have from time to time been reported in this journal.

In beautiful Sonoma more improvements and of greater value have been built than for the previous two years put together. In the town of Sonoma the railroad has been the cause of many substantial buildings being erected. Around Santa Rosa and Healdsburg, many fine dwellings have been built; owing to the high price of hops and fruit received the past season, an unusual amount of money has been placed in circulation; those benefited have been wise in spending their money in improvements to their homes.

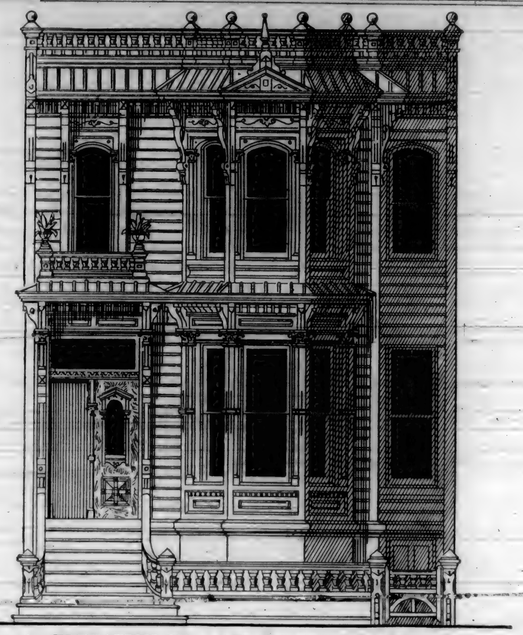

PLATE 4.—ELEVATION OF A "FLAT" COSTING ABOUT $5,000.

Marin is a beautiful name for a county, but "aristocratic" would more nearly represent the truth than the former name. The great curse of this county is the large landed interests held by a few owners, to the exclusion of the multitude. Of course property is always worth what it will bring, but the holders have always asked more than it was worth, and the choice selections have been taken by the few who wanted a pretty location without regard really to the value. Many beautiful improvements have been made, the most valuable of which is the fine mansion now in course of construction for Hall McAllister. Over $100,000 will be spent before it is complete.

San Mateo County cannot boast of many improvements the past year. The buildings erected have, from time to time, been reported. Belmont Park has been graced with a fine new pavilion, which fact will benefit picnickers.

Santa Clara has improved greatly during the season just closed. Many substantial buildings and dwellings have been erected in and around San Jose. The Phelan Block in that place has been the means of improving other property in the neighborhood.

Merced, Stanislaus, Fresno, and Kern have made rapid strides since the railroad has been in operation. The introduction of water for irrigating purposes in Fresno County has changed the whole aspect of the country. We would strongly urge upon the landed proprietors in that section to *plant trees* for fuel and other purposes. A few acres planted here and there of the *gum tree*, through the immense valley forming these four counties, would do more than anything else to remedy the one great defect—viz., a lack of rain. The trees, for fuel alone, in ten years would amount to more than the profit on any cereal that can be raised. We hope the papers all through these counties will take up this subject, and urge upon the farmers the necessity of planting trees, that in the near future wood may be plenty and rain abundant. Fresno City has been the scene of great improvements since the fire, and numerous brick buildings are in progress of erection.

To Los Angeles belongs the palm for most extensive building improvements in any county south of San Francisco. In the vicinity of Riverside, the whole face of the country has been changed by the fine orchards and vineyards that have been planted, and the numerous dwellings that have been erected. The city of Los Angeles has grown wonderfully during the past year. We learn that the completion of the railroad has been the means of causing large numbers of mechanics to emigrate to that city from the South. We trust that a goodly number of masons and bricklayers will come up this way, as, from present appearances, we will not have enough to complete the work now in contemplation. We have printed a list of the principal buildings erected during the year, and in future will be able to give in full nearly all the improvements in this section.

An unusual activity has prevailed in Sacramento during the past year. To a stranger, the city appears like an immense bee-hive. The large improvements now in progress by the railroad company have been the means of keeping hundreds of men and teams at work for months past. A large block, 300x500 feet, has been filled in so that it is higher than the levee. Buildings 100x400 feet will be erected for a foundry. Total cost of money in these improvements will be over $100,000. Our reports during the year have been very full from this county. Outside of the work on railroad property, about half a million dollars have been spent in building improvements.

Woodland has witnessed a steady growth during the past year. All the improvements have been of the most substantial character. A new hotel, where sunny rooms can be had in winter time, is a desideratum much to be desired. We also desire to publicly protest against the use of *wooden lintels* across large openings, especially when the building is intended for public use.

Red Bluff has arisen, Phœnix-like, from its ashes, and numerous buildings are in course of erection.

We have heard of but few improvements in the northern part of the State, and those of but a moderate cost. Taken as a whole, the improvements throughout the State have been of a more substantial character than those of the previous seven years. *The decrease of the mining excitement has done more to effect this result than any other cause.* The high prices of hops and fruit caused the circulation of an immense amount of money, and the receivers thereof wisely spent it in improvements of various kinds, where formerly it was wont to go in the maelstrom of Pine Street and vicinity.

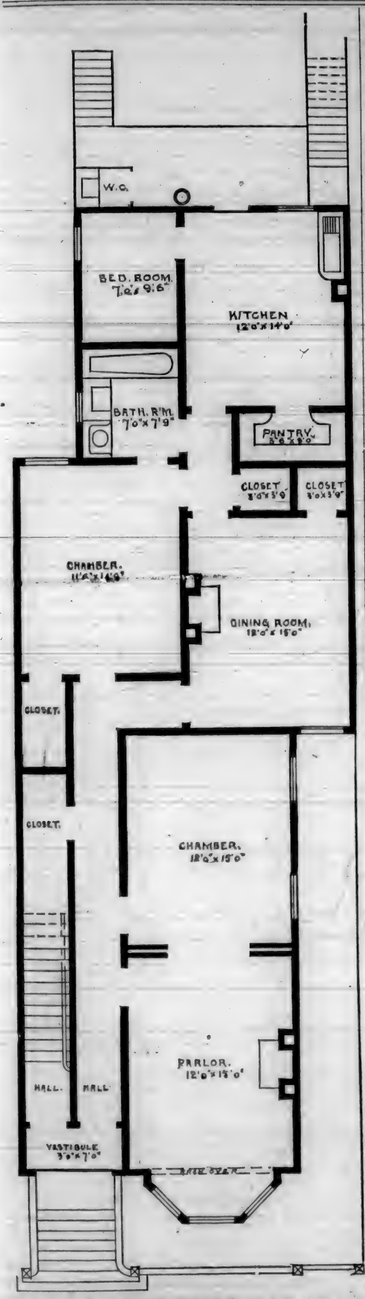

PLATE 5.—FIRST STORY PLAN OF A $5,000 "FLAT."

Our Illustrations.

We present in Plate No. 1 a design that was especially drawn for a gentleman in Marin County. The site is near the entrance to a small gorge in the mountains, and from the situation the house presents a very attractive appearance. It is intended to show a large front, with less accommodations than its exterior would lead one to suppose. The interior arrangement is all that could be desired, every room being in communication with the hall. The plans as shown are very comprehensive, and can be readily understood. The cost of such a building will be in the neighborhood of $10,000.

Plates 4, 5, and 6 are for the elevation and plans of a "Flat." A more convenient arrangement cannot well be had with the same width of lot. The plan as shown can be built for about $5,000.

Plate 7 represents the plans, etc., for a convenient country house costing about $4,500.

Sewer Gas in Barber Shops.

In our December number we inserted an article having the above noticeable heading. Credit for its authorship should have been given to the "SANITARY ENGINEER" of New York. We regret that the name of one of our most valued exchanges should have been omitted from one of its *clippings*, and can assure the editor that it was not intentional, having mistook the meaning of the first line, naturally supposing that the paper there mentioned was the one from which the article was quoted.

Weight of Iron Castings.

A recent authority gives the following easy rules for finding the weight of iron castings: Find its solid contents in cubic inches, and multiply them by .26 for the weight in pounds. For rough calculations the cubic inches may be divided by 4, the answer being pounds. Irregular castings are often puzzling to measure, and cannot be easily weighed. A rough estimate of their weight may be taken, provided they are not cored out; by weighing the pattern, if it is of soft pine, and allowing it 13 times the weight of the pattern if it is new or just out of the sand, and 14 times if it has laid in the pattern loft for some time. Rectangular masses of cast iron one foot square, and more or less than an inch thick, can be weighed by multiplying 37½ by the thickness in inches or fractions of an inch, as the case may be, as 37½ pounds is the weight of a square foot of cast-iron one inch in thickness. The weight of a cast-iron pipe may be found by multiplying the diameter of the pipe in inches by 3.1416, and again by the thickness of pipe in inches or decimals of an inch, and this product by 3.15.

☞ **Subscription price of this journal is $2.00 in advance.**

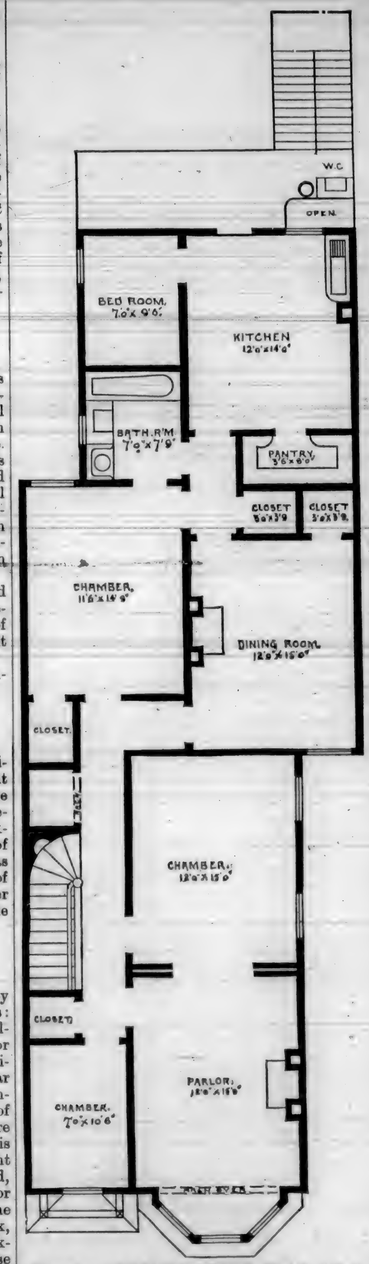

PLATE 6.—SECOND STORY PLAN OF A $5,000 "FLAT."

INDEXED ATLAS OF THE WORLD.

Beautifully bound, in morocco; but one copy remains. Price, $35.00.

THE ARTIST'S ALBUM.

A large work, beautifully illustrated; will be forwarded to any address, upon receipt of price—$8.00.

Architects, Contractors, Carpenters, and Mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them and we will make the cuts.

ANS. TO E. J.—There is a decided advantage in using long lengths of timber for girders. The strength of the part between the posts or columns supporting the girder is about double what it would be if short lengths were used.

EDS. ARCHITECTS: How much bearing should a girder or timber have the end of which is built in a brick wall? C. E. J.

ANS.—At most, the ends of joists or girders should not be over four inches in the wall. It is an erroneous idea to suppose that a greater degree of strength is obtained by letting the ends of timbers rest on or in a wall almost its full width.

FRIEND ARCHITECT: I like your last article on the Steel Square. You fail, however, to give the numbers on the square by which the *Gothic pitch* can be obtained. Please inform me what they are. R. D. G.

ANS.—12 to 21 applied in the same manner as the other measurements will give you the *Gothic* pitch.

SIR CAL. ARCHITECT: In your last you give several methods for finding the length and bevels of common rafters. Will not the same method do for finding the length and bevels of hip rafters, by using different numbers on the square. J. S. T.

ANS.—The same method can be used by taking 17 for the run in place of 12, and the same rise to the foot as is given for the pitch of the common rafters on the same roof.

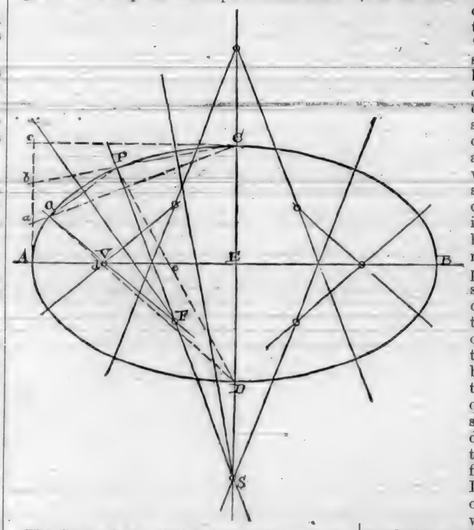
EDS. ARCHITECT: In your last you gave a list of your exchanges. I want to send for a few of them, but as you did not state the place where each was published, I do not know whom to send the money to. Please inform me.
L. R., Berkeley.

We are agents for all the papers referred to; by sending us the amount of the yearly subscription, you will receive them as soon as if sent to the publishers.

The Ellipse.

EDITOR ARCHITECT AND BUILDING NEWS: In the January (1883) number of your journal you publish by request a diagram accompanied by instructions for describing an ellipse with the compasses.

Permit me to offer another, and, what I am sure, is a better solution. And I wish to say in regard to the method of solution which I present to you, that it is the *only* one, so far as I have been able to learn, whereby a *very nearly* true ellipse *can* be described with the compasses, one of the well-known laws of that curve being that *no* part of it partakes of the properties of a circle, and consequently *cannot* theoretically be *truly* described by the compasses. But this method forms a curve so slightly differing from a true ellipse, that it is almost impossible to detect the slightest variation from the curve (formed as it properly should be by the trammel or by a string) and this method. The solution which I offer is the invention of one of the best authorities in our profession as practiced in modern years, Peter Nicholson, and can be found in his "Principles of Architecture," Vol. I., page 25 (edition of 1836), or in his "Dictionary of Architecture" (Revised Edition), Vol. I., page 367, and I ask you to publish it for the benefit of those who may have occasion to make use of the ellipse, and may not have access to the above-mentioned works. Let any one test this method on a large scale, as I have done, and I am sure they will quite agree with me that it is the nearest approach to a true ellipse (made with a trammel or string) that can be made with the compasses, and is correct for all practical purposes. I am well aware that for small work it is a somewhat tedious mode of making an ellipse, but for full-sized details I think it can be very successfully used. The accompanying figure and description will explain themselves.



The lines *A B* and *C D* being given, to describe upon them an ellipse. Draw *A c* perpendicular to *A B*, and equal to *E C*; divide *A c* into three equal parts, *A a*, *a b*, and *b c*; draw *a C* and *b C*. Divide also *A E* into three equal parts, *A e*, *d e*, and *e E*. From *D* through *e* drow *D e P*, intersecting *b C* at *P*, and from the same point and through *d* draw *D d Q*, intersecting *a C* at *Q*. Bisect *P C* by a perpendicular intersecting *C E D* at *S*, join *S P*; bisect *P Q* by a perpendicular, intersecting *S P* at *F*, join *F Q*, intersecting *A E* at *V*. Now, with *S* as center, and radius *S C* describe the arc *C P*; with *F* as center, and radius *F P* describe the arc *P Q*, and with *V* as center, and radius *V Q* describe the arc *Q A*. One (quarter) section of the ellipse is described. The mode of describing the other three sections will readily suggest itself—fix the corresponding centers to *S*, *F*, and *V*, in their relative positions as regards the other sections, and complete the curve. It will be seen that there are eight centers in all required to do so. Very respectfully, yours, etc.,
J. B. W., Architect.
San Francisco, Cal., Jan. 25th, 1883.

Some Suggestions.

A large proportion of the men working in our carpenter shops seem to have ideas and plans connected with their ordinary daily work which, though not absolutely wrong, are so far removed from the correct method, and sometimes so much opposed to nature as to cause a great deal of extra labor and annoyance. Amongst these mistaken notions might be mentioned the various plans adopted by them to bring wood, when warped or twisted, back to the proper, or rather the required, condition. It is very often found to be the case, that wood which in the board or plank is perfectly straight, or which at least appears to be so, will twist and wind in every conceivable manner when freed from restraint, and cut up into long narrow lengths, or cross-cut into short broad panels. When wood is very badly turned—i. e., when it is what is technically termed "winding"—the only remedy is to plane off the high corners and thus make it perfectly true by reducing the thickness. But if it be simply cast, one side being hollow and the other round, the defect may be easily got over. If the man, by working on some other portion of the material required for his job, can let the defective pieces stand for a day or two, then by placing the wood "hollow side" down on a plane surface, or by putting two such boards one on the top of the other, with the hollow sides facing each other, the wood will draw straight without any more trouble on the part of the man. It is always best, when possible, to work up the wood in its natural state, as even if the tendency to cast be overcome previous to working it, there is always the probability of its returning to its normal condition. Some men, when pressed for time, heat the round side on the stove. This does indeed make the wood straight, but there is a great risk of the wood opening and splitting under this toasting treatment, and this liability is very much increased if the wood be at all shaky. If required, the wood can at once be straightened without this risk, by damping the hollow side with water, when the expansion of the fiber on that side pulls it straight. It sometimes happens that a piece of wood of some considerable width, such as a carcase end or a wardrobe panel, has to be reduced from ¾ inch to ½ inch thickness. If this superfluous wood be all taken off one side, that side will become hollow, whereas if it be taken off equally on both sides the wood remains as before.

In veneering panels, etc., it is always best to veneer on the outside, that is, the side opposite the heart side, the reason for this being that veneer is apt to swell with glue being laid on, and must therefore contract after it is fixed. As the heart side has always a decided tendency to curl, the two forces counteract each other, and the wood remains the same. For this same reason, it is always best to inlay on the outside.

To some people these may appear to be trivial matters, but it is by keeping these and other little points in mind that a job may be turned out with more comfort to the man and satisfaction to the employer, and these hints, if carefully attended to, will frequently save time and expense.—*Builder and Wood-Worker.*

☞ **Science of Carpentry Made Easy, $5.00.**

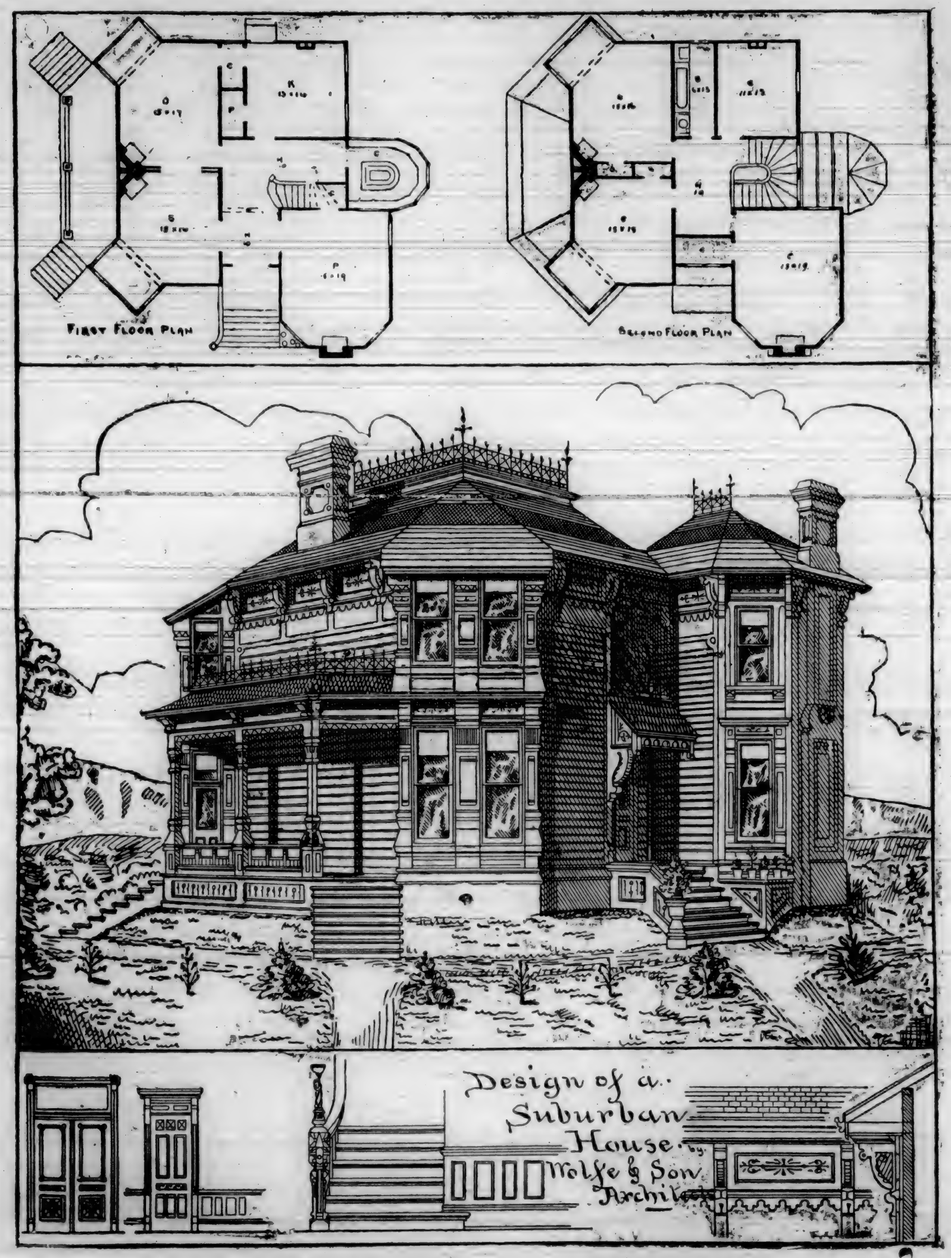


PLATE 7.—PLANS OF SUBURBAN HOUSE COSTING ABOUT $4,500.

OUR EXCHANGES.

We give below an addition to the list of the January issue of this JOURNAL of our exchanges. Space forbids giving a more extended report. It will be seen that all the journals of a scientific or mechanical character, from every part of the country, have honored us on their exchange list.

Building.

A new aspirant for public favor. Its name is somewhat indefinite, not leading any one to suppose that it treats of as many different subjects as it really does. Its articles on *perspective drawing* are alone worth the time and attention of every draughtsman in the country. Price $1 per year.

The Sanitary News.

A welcome addition to our list of sanitary journals. It presents a remarkably neat appearance; its illustrations are more than extra, and no doubt exists in our mind but that it will become the leading journal of its kind in the West. Price $2 per year.

Kansas City Review of Science.

Price $2.50 per annum. Twelve numbers to the volume. At the end of the year have them bound; cost of binding $1.50, total $4; and you have abook that could not be bought for three times that sum. Its articles on anthropology are very interesting. Each number contains fifty-six pages of reading matter of the most attractive kind, and should be in the library of every thoughtful mind in the country.

Industrial News.

This journal is published by the Inventors' Institute in the interest of inventors and the producing class, and for the encouragment of industrial talent and inventive genius. Price $1.50 per annum.

Good Health.

A journal of hygiene, devoted to physical, mental, and moral culture. The articles on the use and abuse of spirituous liquors and tobacco contain much solid reasoning. They should be read by all our young men. Price $1 per year.

American Chemical Review.

We always look with pleasure for this journal to appear. The language, for a technical journal, is written in such an easy, plain manner that it is a pleasure even for an apprentice to read. To the older minds, there is enough in each number for days of study. Terms $5 per annum.

National Car Builder.

This journal is devoted to the interests of railway rolling stock. There is not, however, a cabinet worker or first class carpenter in the country but should subscribe for this journal. Illustrations of the inside fitting of cars are numerous and of much interest to the wood workers. $1 per year.

The Dial.

A monthly index of current literature, and as such should be in the possession of every reading man and woman. $1.50 per year.

The American Ship.

Devoted to American industry, nautical commerce, shipbuilding, timber, engineering, navigation, insurance, and yachting interests. Published weekly. $3 per year.

Granite Cutters' Journal.

Devoted to the interests of stone workers. A complete epitome of the trades in which this journal circulates. $1 per year.

Brick, Tile, and Metal Review.

This journal should be in the possession of every architect, mason, and contractor in the country. It has lately been enlarged and improved, and is well worthy of the subscription price. $1 per year.

The Paper World.

"The hast caused printing to be used. . . . . Thou hast built a paper-mill."—Shakespeare. Even so, Brother Bryan, and from the products of the paper-mill thou hast presented us a journal truly gladdening unto the eye to behold. And we hope that the gladdening glistle may be in the eye of every reader in the country when they shall see your journal after sending you $2 for a year's subscription.

We are prepared to send any journal on the above list or in the January number to any address upon receipt of the subscription price.

The Chicago Cable Street-Railway.

In the *American Engineer* of January 19th, 1883, we find the report of Mr. C. B. Holmes, President of the Chicago Cable Street-Railway. The report is too long to copy in full, so we have selected such portions as will most interest those who live in the home of the cable-railway. There is much in the report of benefit to the managers of the various roads in this city, and it will be to their advantage to send after a full copy as given in the paper mentioned above.

"An important part of the new system is the cables. While the transmission of power by means of wire ropes is very old, the adaptation of cables to street-car locomotion is comparatively new, limited heretofore to San Francisco, and there under conditions which did not necessarily determine many and important problems. At the outset of our operations we found that the splice used in San Francisco would not answer our purposes, owing, probably to the much heavier work performed by our road, and the greater length of our cables. Under the supervision of the manufacturers of our ropes, a splice was adopted which they considered the best, but a short trial proved it a failure. The San Francisco splice was then tried, but it also failed. Mr. Nash, who has had charge of our ropes, then introduced a method of his own, and with anxious interest its operation was watched until long continued use has determined its advantage and success. The difficulty was to secure a splice which should not increase the size of the rope, and expose the splice to abrasion by the grips, which should not draw out when a heavy strain was brought to bear, nor yet allow the ends to loosen when the action of the cars produced a slackness of the rope; one also which should not allow one strand to creep ahead of the others, and projecting up for the grips to cut or tear it up. If nothing else had been done during the season in this department than to discover a successful method of treating this important part of the system, it would have been a season well spent, for it is vital to the operation of the road. Another important matter was the handling of the cables so as not to produce crystallization. A new rope has been made so brittle in San Francisco by a short use as to snap like glass when struck with a hammer. During all our operations so far we have not discovered any commencement of this much-feared condition. Another matter of careful study was to arrange the ropes as not to cut the winding-drums in the engine-house. The suitable coating of the cable is another and important item which has received careful study and attained reasonable success.

"The sudden changes in temperature from heat to cold, from dryness to dampness, would cause the coating to peel off, and in three hours' time the ropes would be comparatively bare and exposed to the dangerous action of the grips. A full statement of the difficulties encountered and overcome would far exceed our limits and your patience. It is with gratitude that the management can say that every difficulty has been so far solved as to relieve anxiety in this direction.

"The length of the cables are as follows: State Street, from Twenty-first Street to Madison Street, 20,290 feet; from Twenty-first Street to Thirty-ninth, 23,792 feet; Wabash Avenue, 23,608 feet; Cottage Grove Avenue, 27,770 feet; State Street loop, 4,361 feet; Wabash Avenue loop, 4,339 feet; Twenty-second Street, 2,684 feet; a total of 106,844 feet, or twenty and one-quarter miles of cable laid and in operation. . . . .

"The company has for two years been engaged in a great undertaking, which has taxed its energies and resources most heavily; but this great labor of construction is now, at least for the present, completed, and all interested have a right to look for compensating benefits from so vast an outlay. From the experience of the last year there seems to be good ground to expect reasonably satisfactory returns from the investment. The public has hoped to find in the cable system seats for all, or nearly all, and speedy transit. The former will be realized by increasing the number of cars, which is being done with energy, and the latter can be attained the moment the cars are supplied with automatic brakes and safety fenders, to do which every possible effort is being made. The whole system will work with greater ease by giving to the cables quicker motion, and this will be done as soon as the cars can be stopped quickly and with certainty, and so protected as to reduce accidents to the minimum."

Durable Colors.

One of the necessary qualifications of the painter is the knowledge of colors that will stand the sun and the weather.

The manufactured chemical colors are generally not very durable, and are therefore not suitable for outside work. The chrome yellows, chrome greens, Prussian blue, are fugitive, whether used alone or mixed. A combination of two colors of durable nature is often subject to change of tone. Of the more durable colors for external use, the ochers, Indian and Venetian reds, burnt and raw umbers, and burnt and raw siennas may be mentioned. Zinc white, though of less body than white-lead, is more delicate and durable, and one American writer says: "Zinc white should always be used in place of white-lead at the seaside, where it is especially durable. The action of the salt air injures the lead." The most durable blacks are lamp-black and vegetable black; the most durable yellows are yellow ocher and Naples yellow, both of which have a good body. Chrome yellow is fugitive, and like other lead salts, it becomes dark in bad air. Of the reds, those to be depended on are the Venetian red, Indian red, light red, and madder lake; carmine lake, vermilion, and chrome red are best avoided on the exterior. The only blue that will stand is ultramarine, though it is expensive.

Prussian blue, cobalt, Antwerp blue, and indigo will fade either singly or in combination. The umbers and siennas, burnt and raw, burnt ochers, Van Dyke brown, are permanent colors. Raw umber is very durable in both water and oil, and does not injure other pigments when mixed with them. The same may be said of yellow ocher, a natural-colored clay, which does not lose its color when mixed with lime, and hence it is well adapted for distemper painting.

Mixed greens are not so durable as those produced direct from copper, arsenic, etc., which are, however, injurious to health. Emerald green made of verdigris and a solution of arsenious acid, and Scheele's green and Vienna green, arsenites of copper, are very poisonous.—*Building News.*

Landlord and Tenant.—Defective Roof.

The Albany *Law Journal* narrates a Minnesota decision which may be cautionary to tenants of apartments, offices, and French flats. The owner of a building in Minneapolis let the various stories of it to different persons. As may be supposed, neither tenant hired the roof, and nothing was said in the brief, somewhat informal agreements made about the duty of keeping the roof in repair. In course of time the roof grew leaky; no one repaired it; a rainstorm occurred, and water percolated through the walls and floors, and drenched and ruined the stock of goods of the tenant on the ground-floor, a dealer in fire-arms and ammunition. He sued the owner of the building for damages, but the court held that the owner and general landlord is not bound, even where the building is let in portions, to make repairs unless he has agreed to do so, or the structure is becoming a nuisance. No doubt this is the rule when a tenant hires a whole building, but we think that in this city, the popular understanding is that tenants of an office, an "apartment," or a flat are entitled to look to the landlord to keep roof, hall, stairs, and the like in reasonable repair. Must they always stipulate for this in so many words? The Minnesota rule is surely very inconvenient, for if the landlord need not repair the roof, the several tenants must each have an implied right to do so, and after any heavy storms, ten or a dozen of dwellers under a leaky roof may gather upon it, squabbling as to how it shall be repaired. If such be the law, tenants should understand it.—*N. Y. Times.*

Book Notice.

We have before us an instructive little book of 202 pages, upon the subject of *House Drainage and Sanitary Plumbing*, by Mr. Paul Gerhard, civil and sanitary engineer, published by Van Nostrand, New York. The subject comprehended in its pages is intelligently handled, and should be read by every one in any manner interested in the subject upon which it treats, including owners as well as architects and builders of houses. Every sewer-layer should be compelled to read and follow its theory of putting in house drains, which, in importance, is only second to skillful plumbing work. And yet, as we have frequently stated, nothing in connection with house-building is more imperfectly done than the sewer work. We repeat, and facts will bear us out in the assertion, that the skillfully, carefully and perfectly laid and jointed side sewers laid in San Francisco will not average more than one in fifty; a large margin, truly, but is nevertheless a fact. The reasons why this is the case are many. First, the necessity for absolutely perfect work in this connection has not, hitherto, sufficiently impressed architects, contractors, and owners with the magnitude of its importance. Second, a considerable number of those *practicing* architecture possess no intelligent understanding of sanitary science, and are mere dummies in directing such works. Third, sewer-layers, as a class, a majority of whom have never read, and are unable to read, a line on the subject, enjoy no other knowledge in their special line than that of putting pipe in the ground, with a grade requiring as little excavating as possible, and sticking the joints together with a little cement, sometimes common mortar, in the *bottom* of the hub, leaving the upper half uncared for, except so far as the cement may be shoved in with a trowel after the pipes are placed together, and then smeared over with cement on the outside. We will wager $1,000 that there is not three in one hundred of runs of side sewers of any length in San Francisco which, if filled with water with two feet pressure, that will not discharge water at seven out of every ten joints occurring, and in a majority of cases the discharge will be large. Fourth, unwillingness of owners to pay a right price for perfect work, preferring to employ ignoramuses, at cheap rates, and take the chances.

The author pursues the subject of plumbing in all its ramifications in an equally intelligent manner, and presents views and theories which should be read and understood at least by all architects and plumbers.

Bids for the Erection of the "Veterans' Home."

The views expressed in the January issue of this journal in reference to the plans for the "Veterans' Home" have attracted considerable attention, and received the approval and indorsement of architects generally. The error of the committee having the matter in hand has been made the more apparent by the estimates of the several contractors who have submitted bids for the erection of the building. Messrs. McDougall & Son placed the approximate cost of their plans at about $17,000, and Newsom Bros. made a positive and definite proposition to complete theirs, under a bond, for $10,000. In this absurd proposition, there was either insincerity or want of necessary ifittelligence, as such conclusion could not be sustained by any rule of computation, either cubing, area measurement, or detail figuration. And had the Newsom plan been adopted, the discrepancy between the proposed cost of $10,000 and the estimates of bidders would have been but little if any less than that developed by the estimates for the McDougall plan. The valuelessness of a bond of the kind proposed is too well understood to require comment, and had the committee accepted a security of that character it would have realized its error in having to pay a much larger sum by the time the building would have been completed. In neither case were the figures presented with the plans as the cost of construction more than equal to two-thirds of the actual value, with this difference: the McDougall figures were given as approximate, without any assurances of certainty, thus leaving those gentlemen free from the imputation of concealed intent to entrap the committee into an expenditure unseen at the commencement; while it was sought in the other case to hoodwink the committee with a bond, which would be harmless upon the bondor, and leave the committee helpless as to the excess in cost of construction.

All of which serves to sustain us in our unqualified disapproval and condemnation of competitive plan-making, which in but a very limited number of cases, if in any, there is not more or less injustice, unfairness, and wrong, and in which as a rule gross misrepresentations and dishonorable dealings in some form or direction are not conspicuous elements.

Had the committee selected the Messrs. McDougall & Son, or any other reputable architect or firm, and consulted with them as to what character and description of building could be built for a stated sum, the party or parties selected would have been relieved from the pressures which invariably bear when the competitive method is resorted to. It is all nonsense to talk about the high standing and unimpeached reputation of architects, *or any other class of men*, when their services are sought with an "if"; and the *if* is always a prominent factor in every competitive case. Consequently, no man of intelligence engages in such contests without taking into consideration the ifs and the ands, as with scarcely an exception, something more than merely the best plans and most perfect drawings are indispensable to success.

There are no reflections due the McDougalls at the result of the figures given below, as these are the natural result of the course the committee has seen fit to pursue; and a similar result would have been a matter of record had the rejected plans been adopted. The bids submitted ran as follows:

Moore Bros., for main building, $29,000; cottages, $1,950.

G. W. Davis, general bid, $19,370.

Ingerson & Co., main building, $25,000; cottages, $1,750 each; laundry, $920.

L. Larrence, main building, $28,398; cottages, $2,300 each.

W. Commary, general bid, $28,348.

S. G. Worden, main building, $28,388; cottages, $2,098; laundry, $1,991.

John Cox, main building and laundry, $27,740; cottages, $1,780 each.

A. L. Fitzpatrick, general bid, $27,000.

A. Herbst, general bid, $27,000.

Cummings & Rebman, main building, $32,171; cottages $2,100 each; laundry, $1,565.

Removal of Grease Spots.

Whenever oil of turpentine, benzole or ether is used to remove grease spots on cloth, the application should be made on the reverse side of the cloth, by moistening it with the solvent in a circle surrounding the spot, so as to approach it gradually, having blotting-paper in contact with the spot of grease, to absorb the fat immediately; otherwise the solvent will have the effect of spreading the grease over a larger surface instead of driving it out of the cloth. In the application of a hot iron to one side and blotting-paper to the other, the heat will drive the grease out of the cloth into the paper, because the fat has a tendency to move from the hotter parts toward the cooler.

The School Department Architect.

Without intending disparagement to the claims of the other two gentlemen seeking the appointment, both of whom have heretofore occupied the place with credit to themselves—Mr. O'Connor preceding Mr. Curlett, the retiring architect, who has held the position for a considerable length of time—we congratulate Mr. Welsh upon his success in securing the appointment, and trust that his record at the end of his term of service may be entirely free from any just cause of reproach. The duties of the position would doubtless have been well performed by either of the other gentlemen, so that the successful party has the greater cause to appreciate his success, than if, as has sometimes been the case, some of the applicants had been inferior men.

We also appreciate the appointment as far as San Francisco Chapter is concerned, in its being so far recognized by "our city fathers" as the selection of one of its members to fill the responsible duties of School Department Architect. And we trust that the time is near at hand when membership in the Chapter will exercise a controlling influence in the selection and appointment of architects for all public buildings and works, and also with owners of private property in the erection of all classes of buildings. It should be so, as prominent among the aims and purposes of the Chapter, is mutual improvement, the cultivation of a higher understanding of professional duties, friendly interchanges of views, and free discussions of all matters and principles architectural, calculated to assist and increase the proficiency and draw out and establish in the members of the Chapter understandings and sentiments becoming those assuming the honorable and responsible calling of architects.

To the *few* worthy and competent gentlemen in the profession who have not identified themselves, we say kindly that they are at fault, and although they may "get along" satisfactorily to themselves, and the Chapter not suffer through lack of their membership, the united commingling of all the reputable architects of this coast in one grand Chapter brotherhood, would have a beneficial influence upon the entire profession, and place it in a more favorable light with owners than is possible with the semblance of division in our ranks.

Steam Heating for Buildings, or Hints to Steam Fitters.

By William J. Baldwin, steam heating engineer—with many illustrations. The subject of this volume, 234 pages, is one of interest to the people of this coast, and should be read by owners as well as by architects and those engaged in steam heating works, as its contents and illustrations amplify the whole subject-matter in all its connections.

Saw Filing.

By Grimshaw, is a neat little book of 77 pages, which should be in the hands of every carpenter, as well as all millwrights and others using saws. Filing saws may appear as a very simple matter, yet not one in ten who sharpen saws understand anything about the best, or right method of applying the file to the saw blade. And but few take into account the amount of extra labor expended in using saws improperly filed. It is a fact that a man will do a much larger amount within a given time, and with much more ease and comfort to himself, with a saw artistically filed and set than with one as filed by the great mass of saw filers.

The Materials of Engineering.

First of three parts—a well and carefully written volume of 364 pages by Robert H. Thurston, A. M., C. E., professor of engineering, etc. Its index refers to two hundred and fifty-one separate subjects or features, comprehending the subjects—stone, cements, timbers, and other materials, giving extended remarks upon their various peculiarities of their respective classifications, strengths, uses, applications, characteristics, etc.; including also in present number reference to nearly fifty species of timber, from the common pines, firs, and spruces, etc., to the hard-wood family, with detailed description of each; also fuels, lubricants, and a long range of tables, logarithms, and other valuable matter. It should be in the library of every civil engineer, architect, contractor, and mechanic, as its fund of information is practical as well as scientific.

☞ Subscription price of this journal is $2.00 in advance.

New Building Construction.

The public is respectfully invited to examine the

NEW BASEMENT CONSTRUCTION

OF

Mr. Somers' New Building

741 and 743 MARKET STREET,

Opposite Dupont.

W. P. MOORE, ESQ., ARCHITECT.

By this improved construction of beams and girders, and at no greater expense than usual, the basement becomes one large room, unobstructed by the usual unsightly and unnecessary brick piers, that not only divide the apartment, but take up valuable unnecessary space, and obstruct the light coming through the illuminating platform in its passage to light the rear of these deep basements. Also, by this construction, the first story front can be changed to suit different tenants.

P. H. JACKSON & CO.

Constructors of the Beams and Girders, No. 2 California St. and 231 First St., this city.

IMPROVED

BUILDING CONSTRUCTION

Franklin Girders

FOR

BUILDINGS AND BRIDGES

The most economical constructions made. They are so proportioned that the opposing forces and strains of compression and tension are to a great extent neutralized. Their cost is about 40 per cent less than those in common use in this city, and are free from their objective weakness when made up of pieces in length. These girders are made of any length, and sustain any load up to 1,000 tons.

P. H. JACKSON & CO.

2 California Street and 231 First Street, San Francisco.

The Lateral Support Issue.

The rights of coterminous owners to the lateral support of each other's land has for generations been a source of countless personal conflicts, disputes, and troubles, and innumerable law suits, involving in some cases, large amounts in damages claimed, and costs and expenses attending litigations.

The arguments on both sides of the issue appear reasonable and convincing when viewed from the respective standpoints of each, with a strong admixture of the "whose bull is gored" doctrine. The owner of improved property asserts his rights to the undisturbed enjoyment thereof, denying the rights of his neighbor to the same enjoyment, unless, if need be, the latter shall bear all the cost and expense of holding the former harmless; while the owner who proposes to make improvements contends that he should not be required to do more for his neighbor than exercise due care and precaution in the prosecution of his improvements, so as to prevent any avoidable injury to his neighbor's premises, and affording all necessary facilities to his neighbor to protect and sustain his property. This latter view of the case is certainly the better sustained by logical and reasonable arguments, and should be the rule; as in all cases of conflicting rights those which are exclusively personal should be made to yield to others which are more general in character. The personal right feature is that of owners of improved property being protected against any outlay of money not of their own choice, and the more general that of encouraging and stimulating new and better improvements. The "public good" should rise paramount in all cases, and if, as is the fact, owners of unimproved lands are often deterred from making improvements through unwillingness to bear the expense of taking care of adjoining property, the protection most feasible and politic is that which will remove the hinderances and stimulate and encourage improvements. Innumerable examples exist that where the law compelled owners desiring to build to sustain and underpin the property of coterminous owners, that rather than be forced to do so, inferior improvements have been made, or the premises have remained from year to year unimproved, or been sold to avoid the unfair demand. Mere "shanties," shops, and unimportant constructions are sometimes substituted for costly and elegant buildings, to avoid the obligation to sustain adjoining property, and many fine lots in San Francisco have remained unimproved for these reasons; and at the present time the fact is well known to every prominent architect, of owners who have refused and continue to refuse to make improvements for the reasons named. Under this state of facts, the law as it now stands, compelling those who build to protect and underpin the adjoining property, should be changed so as to permit every owner who desires to do so to improve his property in a proper and reasonable manner, without the entailment of expenses in taking care of that in which he has no interest.

The city ordinance which sustains this view of the case, establishing the right of each owner to excavate to a depth of fourteen feet, is just and proper. In New York and other large cities this same feature of law exists, defining the depths of excavations, so that all owners enjoy a common right and privilege, with the additional provision that those excavating to a greater depth shall bear the expense of coterminous underpinning. We do not advocate unlimited excavations, nor any rule or law which infringes the rights of any one to a reasonable enjoyment of his property; but there can be no sound argument adduced why those who desire to make building improvements should be deterred from doing so, rather than spend additional money to build bulkheads, put in foundations, etc., to keep safe old rickety constructions, or better buildings erected with foundations resting upon or near the surface of the ground. The lesser should yield to the greater, and it is a poor argument to urge that new and modern constructions should be taxed to sustain older and less desirable and less taxable property.

Need for More Skilled Labor in San Francisco.

During the past year there was a great scarcity of skilled labor in San Francisco in many lines of operation; so much so, that it was a common thing to see sign boards on buildings—"carpenters wanted"—and many advertisements were inserted in the daily journals offering engagements. Consequently, every carpenter worth a shilling a day found employment, and some who were not worth four bits per diem on fine work, received the pay of competent workmen; and architects, and the better class of contractors, were greatly disadvantaged, the former in being compelled, by force of circumstances, to submit to less perfect work than desired, and the latter in being unable to furnish the class of help necessary on good work. This led to an advance in wages in many cases, contractors, under the stress of conditions, being willing to submit to and even offering increased pay to secure sufficient help. And even during the dull season—since December 1st—but very few have been idle, the bosses managing to keep their forces together, fearing inability to replace them when busker times return. There is every probability that the same condition of affairs will exist in an increased form during the current year.

The same state of facts has ruled among the brick-masons, a full supply of good hands being an impossibility the greater part of the year, with no abatement during the present less busy part of the present season. Several of the more prominent of the master masons have requested us to invite labor to this city, and from appearances more must be had to fill the prospective necessities for labor. First-class brick-layers are securing as high as $5.50 per day, and with the rush of work anticipated, should it come on, as is reasonable to expect it will, there is not at present a supply of help to be had, and without some addition thereto, delays in construction is bound to follow, and perhaps arbitrary demands for excessive wages. Unfortunately, the labor ranks of our journeymen brick-layers have been reduced by many of our best workmen going to Portland, Los Angeles, and other points on this coast, where the building interests have been active, through general prosperities, fires and other causes, while the indifferent and scrubby classes have remained, making the best of such opportunities as have and may present themselves to fill the places of competent hands, in laying the foundations and building the chimneys for frame buildings, etc., on their own account. It will, therefore, be safe for quite a number of first-class journeymen brick-layers to wend their way to San Francisco.

Among the plasterers the same conditions exist to a considerable if not equal extent; so much so, that the price of lathing and plastering has advanced over the rates prevailing two years ago of fully one-third, and the journeymen have recently notified the bosses of an intended demand for increased wages.

In our recent visit among the machine shops and foundries we found a similar state of affairs—scarcity of competent skilled workmen, and a demand for increased supply. All this speaks well for this city and coast, as everywhere, from its most distant borders, and throughout intervening sections, the most encouraging accounts come to us.

The Steel Square and Its Uses, Price, $1.00.

The Great Chinese Encyclopædia.

The celebrated "Chinese Encyclopædia," which was purchased some months ago by the Trustees of the British Museum for fifteen hundred pounds sterling, has been safely lodged in that institution. It forms the most important acquisition to the great national library which has been made for some time past. The work is remarkable as having nothing parallel to it extant in the literature of other countries. It is comprised in five thousand and twenty volumes, and consists of a vast *thesaurus*, into which is digested the entire mass of Chinese literature extant at the date of its publication, classified under appropriate headings, and accompanied with illustrative drawings, plans, and maps. It includes treatises ranging from 1150 B. C. to about the year 1700 of our era, and it professes to represent every branch of Chinese literature, with the single exception of works of fiction.

It was compiled in the early part of the eighteenth century by an imperial commission under the orders of the great Emperor Kang Hi So, well known to us from the accounts of the Jesuit Missionaries whom he favored and assisted, and who were his instructors in European art and learning. This emperor was himself a great writer, and he was struck in the course of his literary investigations by the alterations and corruptions which are gradually being introduced into the texts of standard works. He therefore conceived the idea of reprinting from the most authentic editions the whole body of Chinese literature then in existence. A commission of high officials was appointed to select and classify the texts, and its labors extended over forty years, terminating in the publication of the work in 1726. For the purpose of printing it a complete font of copper type was cast, under the direction of the Jesuits, who probably superintended the printing.

Only one hundred copies were printed, a number which has been much reduced since the time of the issue by various casualties. The whole impression was distributed as presents among the princes of the imperial family and the great State officials. The type used in the production of the work is said to have been melted down shortly afterward, and converted into money to meet the exigencies of the government during a financial crisis, and in this way the means of producing a second edition was destroyed. The copies which still exist are in the hands of the families of the original recipients, from one of whom the copy just happily brought to London has been purchased. So completely private is the ownership of copies of this "Enclyopædia" in China, that no copy is known to be accessible for reference to the general body of students of that country.—*Paper World.*

How to Split a Sheet of Paper.

It is one of the most remarkable properties of that wonderful product, paper, that it can be split into two or even three parts, however thin the sheet. We have seen a leaf of the *Illustrated News* thus divided into three parts, or three thin leaves. One consisted of the surface on which the engravings are printed; another was the side containing the letter-press, and a perfectly blank piece on each side was the paper that lay between. Many people who have not seen this done might think it impossible; yet it is not only possible, but extremely easy, as we shall show. Get a piece of plate-glass and place on it a sheet of paper; then let the latter be thoroughly soaked. With care and a little dexterity the sheet can be split by the top surface being removed. But the best plan is to paste a piece of cloth or strong paper to each side of the piece to be split. When dry, violently and without hesitation pull the two pieces asunder, when part of the sheet will be found to have adhered to one and part to the other. Soften the paste in water, and the pieces can be easily removed from the cloth. The process is generally demonstrated as a matter of curiosity, yet it can be utilized in various ways. If we want to paste in a scrap-book a newspaper article printed on both sides of the paper, and possess only one copy, it is very convenient to know how to detach the one side from the other. The paper, when split, as may be imagined, is more transparent than it was before being subjected to the operation, and the printing ink is somewhat duller; otherwise the two pieces present the appearance of the original if again brought together. Some time ago, the information of how to do this splitting was advertised to be sold for a considerable sum. We now impart it to all our readers gratuitously.—*British Stationer.*

Chinese Mode of Manufacturing Sheet-Lead.

The making of sheet-lead for the lining of tea chests, etc., is a somewhat important industry of Hong Kong. It is made principally in sundry establishments to the westward. On entering one, the workmen will be seen with shears busily employed in cutting out the sheets of lead into the required sizes and shapes. The shears are simply a large pair of scissors firmly fixed to a solid block of wood two feet in height. The lower blade of the shears terminates in a square piece of iron instead of being pointed, as is the upper blade. The sheets of lead will also be observed to be of small size and somewhat irregular in shape; and this arises from the method of manufacture, as will subsequently be seen. Going farther into the shop will be seen an iron pan raised twelve inches or so above the ground, and carefully finished off.

Beneath this iron pan is a furnace, and at the side of the pan next the wall is the flue communicating with it. In this pan the lead is melted, and when judged to be hot enough, the workmen take two of the large, square paving tile, which may be seen almost anywhere in the colony, and these are then smoothly and carefully covered with several layers of unsized paper. Having placed these two tiles before him, one above the other, the workman raises the upper tile with his left hand, and taking a ladle of the proper size in his right, he dips it in the melted lead, and then pours its contents on the upper tile, and quickly presses the lead out in the form of a sheet. The paper being a bad conductor of heat, the lead does not solidify immediately it leaves the ladle, and by long practice the workmen always ladle out the same quantity of lead; the sheets made vary but little in size or thickness.—*Scientific Press.*

Articled Students and Draughtsmen.

Classes are now being formed for instruction in Modeling, Carving, Drawing, and Mathematics, under the auspices and control of the San Francisco Chapter American Institute of Architects.

Articled Students in the Profession will receive instruction free. The Classes are open to all, however, upon the payment of a small tuition fee.

The class in modeling is now being formed under the direction of F. Marion Wells. All those desiring to join this class will at once apply either to Mr. Wells, or the Secretary of the Chapter, 240 Montgomery St., S. F.

Anecdote of W. M. Hunt.

Your stories of Hunt remind me of another, hardly less amusing, and, like yours, illustrating his sense of the dignity of his art, and his peculiarly undignified way of showing it. During the last winter of his life, he one day called upon an artist to look upon a portrait which had been returned with some expression of dissatisfaction from the subject and owner; and to give his friend, the artist, the benefit of his judgment in the matter of changing and so improving the picture that it should "pass muster" as a creditable work of art, even if it did not quite suit the taste of the patron. The chief defect complained of was the complexion, which was thought to be sallow; and it was true that in the process of giving the flesh a warm glow the artist had given an impression of local yellow in the flesh tints, so strongly marked that the complexion was yellow. When Mr. Hunt entered the studio, he looked at the portrait as it stood upon the easel, and said: "They think it is too yellow, do they? They always think it is too something except good. Your yellows are all right with your reds and the general tone of the picture, and that is well enough. Look at that bit of sky in your landscape (pointing to another picture). Isn't that good for sky to your trees and foreground? But it isn't much like that," looking up at the light which poured through the window, "and who said it was? The fact is, people don't know anything about art, and the more they know about other things, the less they know about that. But they know what they like,' and they don't mean to pay till they get it. They rank portrait-painters with tailors—no fit, no pay. We ought to make a stand against the unreasonable demands of the public, and let the patron share our risk. Of course we all do the best we can, and we should be paid for our work just as we pay our doctors and lawyers, whether they bring us through or not. I would have an order for a portrait mean the best thing that I can do with a reasonable effort, and that should fulfill my obligation and entitle me to be paid. Of course, I like to have people satisfied when I am, but I am the one to be pleased. I know something about my work, and they don't, and when I am willing to let a picture go that ought to stand for something, whether they are satisfied or not. But then there is another way. You know we should paint better portraits if we didn't care a d——n for our sitters. Suppose, now, when a patron calls to order a portrait, I should say: 'I will not take your commission in the usual form, but I will hire you to sit, and pay you one dollar an hour, and if you like the picture when I call it done you can have it for a stated price, and if you don't like it you needn't take it, and there will be no favor either way.' With a sitter on such terms I think I could turn out something pretty good. I know I should have a good time. I'd manipulate him just as the barber does his victim, and if he dared to open his head about art or anything improving, I'd stop his yop with a paint-brush. I'd just have my way till I got through, and then he could have his—take it or leave it."—*Letter to the Boston Transcript.*

It is gratifying to notice that English experts on returning to their country acknowledge that there is a great deal to learn in the building trade of this country. While little is said as to any advance made by the American brotherhood of architects, the ingenuity displayed in the interior construction of our homes by the builders is greatly applauded. Our English critics will ascertain erelong that we must attend first to the useful then to the ornamental and beautiful.

THE

CALIFORNIA ARCHITECT

—AND—

BUILDING NEWS.

Published on the 15th of each month

BY THE

San Francisco Architectural Publishing Co.

JAMES E. WOLFE, {Editors & Managers} GEO. H. WOLFE.

Rooms 11, 12, 13, No. 240 Montgomery Street.

Terms in Advance, $2.00 Per Annum.

ENTERED AT POST-OFFICE AS SECOND-CLASS MATTER.

ADVERTISING RATES.

Front Cover, outside, per square, each insertion	$2.50
Back " " " " "	2.00
Pages preceding and following reading matter, per square, each insertion	1.50
Other inside pages, per square, each insertion	1.00
Full page, inside, one insertion	30.00
Each subsequent insertion	25.00

Advertisements alone inserted that refer to materials used in the construction and furnishing of houses, and to matters and trades belonging to the building interest.

NO OTHERS RECEIVED.

Advertisements inserted for 3 months or less are payable in advance; payable quarterly when inserted for a longer period.

A square is ⅜ of an inch in length by width of the column.

When money is sent for subscriptions, the receipt of a copy of this journal is an acknowledgment that it has been received. Unless requested, we do not send receipts.

Bound Volumes of This Journal.

Through the kindness of a few of our subscribers sending us numbers of which we were short, we have been enabled to have sixteen complete volumes of this journal bound. When these are gone, we will be unable to supply any more complete sets.

Bound volumes of 1879, 1880, 1881, and 1882 (in one book) complete, with all ads. and covers removed, will be sent to any address upon receipt of $8.00.

Bound volumes 1879 and 1880, in one	$2.50
" " 1881 and 1882, each	$2.50
" " 1880 (only a few left)	$2.00

In 1880 the subscription price of this journal was only $1.50, and we have put the price of bound volumes accordingly.

Volumes of 1882 and the sixteen full sets are all supplied with a full index.

Any one failing to receive a complete index will be supplied by sending a postal card to this office with their address.

Business Outlook.

The unusually light rains for the season since November last, and particularly the meager amount that has fallen since the first of February, has stimulated speculations as to the probable effect upon the building interests during the year. It is well understood that all interests hang and depend largely upon the quantity of rain that falls during the rainy season; those so excessive in quantity as to produce floods and inundations, and others so limited as to cause the seed sown to perish without yielding adequate returns for the cost and expense of sowing, produce their respective evils and discouragements; while the years in which the heavens have distributed their showers in due season, and in sufficient quantities, have caused the hearts of all alike to rejoice, and prosperity to abound throughout the land. The wet season of 1881–82, up to the month of February was no better than the current year; but in March last copious showers came, and the deficiencies of the preceding months were in a large degree made good; and with the exception of a few localities, good crops were gathered, and general prosperity followed. And should a fair amount of rain fall during the present month of March—followed by April showers, we may reasonably anticipate a satisfactory condition of things generally, and prosperous times in building operations.

Although no notably large jobs have been reported within the current year, the number of lesser buildings for residence purposes reported in present issue, as in the two previous numbers, are largely in advance of the corresponding months of 1882; thus showing that the shortness in rain supply has not as yet worked any injury to the building trades; and even should the rainy season terminate short of a sufficient supply for agricultural and mining purposes, no very serious consequences need be anticipated as far as the building interests in San Francisco are concerned, as there is that degree of financial firmness among the owners of real estate generally, that improvements will be made as rapidly as the demand for additional buildings shall justify; and it is a well-assured fact that the demand for rentable property has hitherto been fully equal to the supply, with tendencies in favor of the demand in the future.

Anticipated speculation in cereals may induce a few to delay active building operations for the time being, until the crop results are reached; and should these turn out favorably, a large investment in property improvements may be relied upon during the more advanced months of the year.

It is to be regretted that a wiser and more intelligent course has not been pursued by the contracting fraternity of this city during the past year. But few have anything to show as gains and profits on contracts executed, while the financial "short" jobs are numerous. Eagerness to secure contracts, more than wise and judicious figuring, has controlled in a majority of cases, and losses and *pro rata* settlements have been of frequent occurrence. The very many failures which have from time to time occurred have, with few exceptions, shaken the confidence of material-men and owners in the trustworthiness of those who from year to year handle millions of dollars in the erection of buildings. The mere fact that a man is honest is not a sufficient guaranty that their bills will be paid upon maturity if the work upon which the obligations are created does not afford sufficiency of coin to meet demand. The taking of contracts for less than a paying sum is a species of unwisdom which intelligent men should reject; and it would be infinitely better that a much less amount of building was done at fair and paying rates, than to crowd the market with unprofitable work, upon which losses must occur to material-men, bondsmen, or others involved under such contracts. At present writing, the sudden disappearance of a somewhat prominent contractor is the subject of general comment in building circles, and stories are flying around in reference to many others, whose integrity as individuals is not questioned, but whose financial conditions are reported to be deplorable. Many are named as being carried by material-men—some of them in large amounts, with the possibilities of suspension and financial disaster constantly hanging over them. This is by no means a pleasing recital, but the facts suggested are beyond question, and should lead to reform on the part of those who pursue the contracting business. The next to childish argument, that work must be figured down to and be taken at a low figure to secure contracts, should not be entertained; yet it is countenanced by men who in other things exhibit a reasonable amount of good business sense. If fools see fit to pursue such a course, wiser men should permit them to indulge in their folly, until crushed beneath the ruins of their errors, they sink away into that oblivion which should come to every man whose course of business is other than wise and self-sustaining.

San Francisco Chapter American Institute of Architects.

The regular monthly meeting of the above Chapter was held on Friday evening, March 2nd, 1883. Vice-president Wm. Curlett occupied the chair.

The minutes of preceding meeting were read and approved.

The committee on Articled Students reported as follows:

REPORT OF THE COMMITTEE ON CLASSES.

To the Cal. Chapter of the A. I. A.

GENTLEMEN: Your committee, appointed for the purpose of instituting classes in various elementary studies for Articled Students beg to report that they have succeeded in establishing two classes: 1st, in modeling, in charge of F. Marion Wells, sculptor; and one in drawing from models and flat studies, temporarily under the charge of G. H. Sanders, architect.

A third class, in practical architecture, will be inaugurated during the current month by Mr. Albert Pissis, architect.

There will be four pupils in each of the above classes.

Mr. John Bryant, carver, has consented to take charge of a class in carving as soon as arrangements can be made for the same.

They also hope to arrange for the mathematical class, during the current month.

It is proposed, from time to time, to exhibit before the Chapter the work of the pupils in the various classes, as they attain the necessary proficiency.

Respectfully submitted.

G. H. SANDERS,
JAMES E. WOLFE,
A. LAVER,
T. J. WELSH,
Committee.

Report was adopted.

Committee in regard to paying the claims of the competitors in the first competition for the frontispiece of the CALIFORNIA ARCHITECT AND BUILDING NEWS reported in favor of paying such claims, and awarded the first premium to Oliver Everett and the second to W. J. Cuthbertson.

Mr. P. H. Jackson then read a very able and scientific paper, which will be found in full in another column. He was warmly applauded, and a vote of thanks unanimously tendered him. He also answered many questions that were proposed by members of the Chapter in regard to his subject, and his replies showed him as one thoroughly conversant with all matters pertaining to the paper read. Meeting adjourned.

Awarding the Palm.

We think that the palm for a "cheeky" proposal should be awarded to the following correspondent:

—— Co., Feb. 19th, 1883.

FRIEND EDITORS CAL. ARCHITECT: I take your valuable journal, and find it invaluable. Will you please send me a copy of your —— No., 1882. I built a house after one of your plans and had to cut out the elevation and plans and paste them on a piece of stiff card-board, so I could have them in my chest. As I want to keep a full set of your books, I write this to please send me another one to take the place of the one I had to use. I suppose you always have a few left.

Respectfully, — R.

The above is a *verbatim* copy of a letter received from R., in one of our southern counties. The gentleman admits that he built a house from a plan taken from our journal, thus saving about $50, the amount that the plans were worth for the drawing alone. He then has the courage to write us for a copy to replace the one used, and did not even inclose a two-cent stamp to pay the postage.

We know of several cases similar to the above, and place this one before the public as a specimen of superior unintelligence on the part of one who receiveth bread and then giveth a stone.

Articled Students and Draughtsmen.

Classes are now being formed for instruction in Modeling, Carving, Drawing, and Mathematics, under the auspices and control of the San Francisco Chapter American Institute of Architects.

Articled Students in the Profession will receive instruction free. The Classes are open to all, however, upon the payment of a small tuition fee.

The class in modeling is now being formed under the direction of F. Marion Wells. All those desiring to join this class will at once apply either to Mr. Wells, or the Secretary of the Chapter, 240 Montgomery St., S. F.

American Lumberman.

We are pleased to receive on our exchange list this worthy candidate for public favor. It is printed at New Orleans, subscription price being fixed at $3.50 per annum. Published weekly. All those interested in matters in connection with the interests it seeks to foster will do well to subscribe for the journal.

Should the Wood-work of our Houses be Painted?

Of the many and varied materials which our house-builders make use of, wood unquestionably may be accounted as being one of the most beautiful. Its claim to superiority in this respect is based upon an unassailable standpoint, for its beauty is a natural qualification.

The time is not so long past when custom acquiesced in the practice of covering over house doors, and joinery work generally, constructed possibly of oak, with a paintwork imitation, if imitation it can be termed, of figured or strongly grain-marked oak. This style of paintwork was and is commonly termed "oak graining."

At times the painter's efforts assumed a ridiculous direction; for he would venture on perfectly sound wood to imitate a line of sapwood, and thus attempt to transform *perfect* into an appearance of *imperfect* wood. No conscientious effort was in the generality of cases made to imitate grained oak, but an effect which custom had consented to regard as an imitation was deemed sufficient, and so what a popular American showman a short time ago designated to an audience as "a symphony in yaller" was allowed to pass muster. The situation assumed a more grave aspect when such woods as walnut and rosewood were attempted to be imitated, and shortly after marble mantelpieces were more generally introduced into our houses, and when the house painter endeavored to transform the honest old wooden mantelpieces into marble the climax of his artistic impudence was attained, and it was about time that our architects awoke from out of their lethargy, and put a salutary check upon his further doings. He stuck, however, to his "oak graining" with exceeding tenacity for a long time, and it was only his efforts to imitate the "fancy woods" indoors which even to the present appear to have been effectually stamped out.

Seriously, the house painter is in a way a great nuisance, for not only does he often offend good taste, but his work is for the most part really disadvantageous.

How often is it to be found in these days, when public taste is centered upon what is vaguely termed "æsthetic decoration," that labor and material are expended upon the decoration of the wood-work of a room which, if it had in the first instance been expended upon the wood itself, would have secured good and really beautiful material.

The almost boundless forests of Central America contain at least some dozens of tropical hardwoods, all beautiful, all serviceable, and mostly adaptable, which would unquestionably be shipped to this country if a demand for them were created. Of late years we have seen an active demand spring up for a long-neglected and beautiful wood—American walnut—and it is not venturing too much to prognosticate that in future years we shall see many other colored woods come largely into demand in this country.

The limit of selection in blending of woods in the making up of any wood-work article is almost illimitable. The quick genius of our American cousins long ago found this fact out, and much of the wood-work to be found on the other side of the Atlantic might well put to the blush anything our modern joiners nowadays produce. It cannot be said of our modern architects that they have of late years made no effort to better the fashion in respect to the wood-work of our houses, but the effort has been almost entirely in the direction of design, while selection of material, and particularly the blending of colored woods, has been almost entirely overlooked or neglected.

Practically, as we have remarked, no effort has been exercised in the adoption and use of colored woods, so far as the blending of them together in one design is concerned. Form has been specially aimed at, color has been neglected, or, more correctly speaking, it has been handed over for the painter to deal with, natural and legitimate means have been relinquished for artificial measures, and the result has of course been altogether unsatisfactory.

Let it be pictured, a library, for instance, with walls wainscoted, roof carved or paneled, floor laid with and doors and windows constructed of suitably selected mahogany, and let such a room be contrasted with one decorated by the painter in however tasteful a manner. The two conditions would fairly represent the real and the counterfeit, the true and the false, in respect to art, yet the cost of the two productions may vary but little in the total.

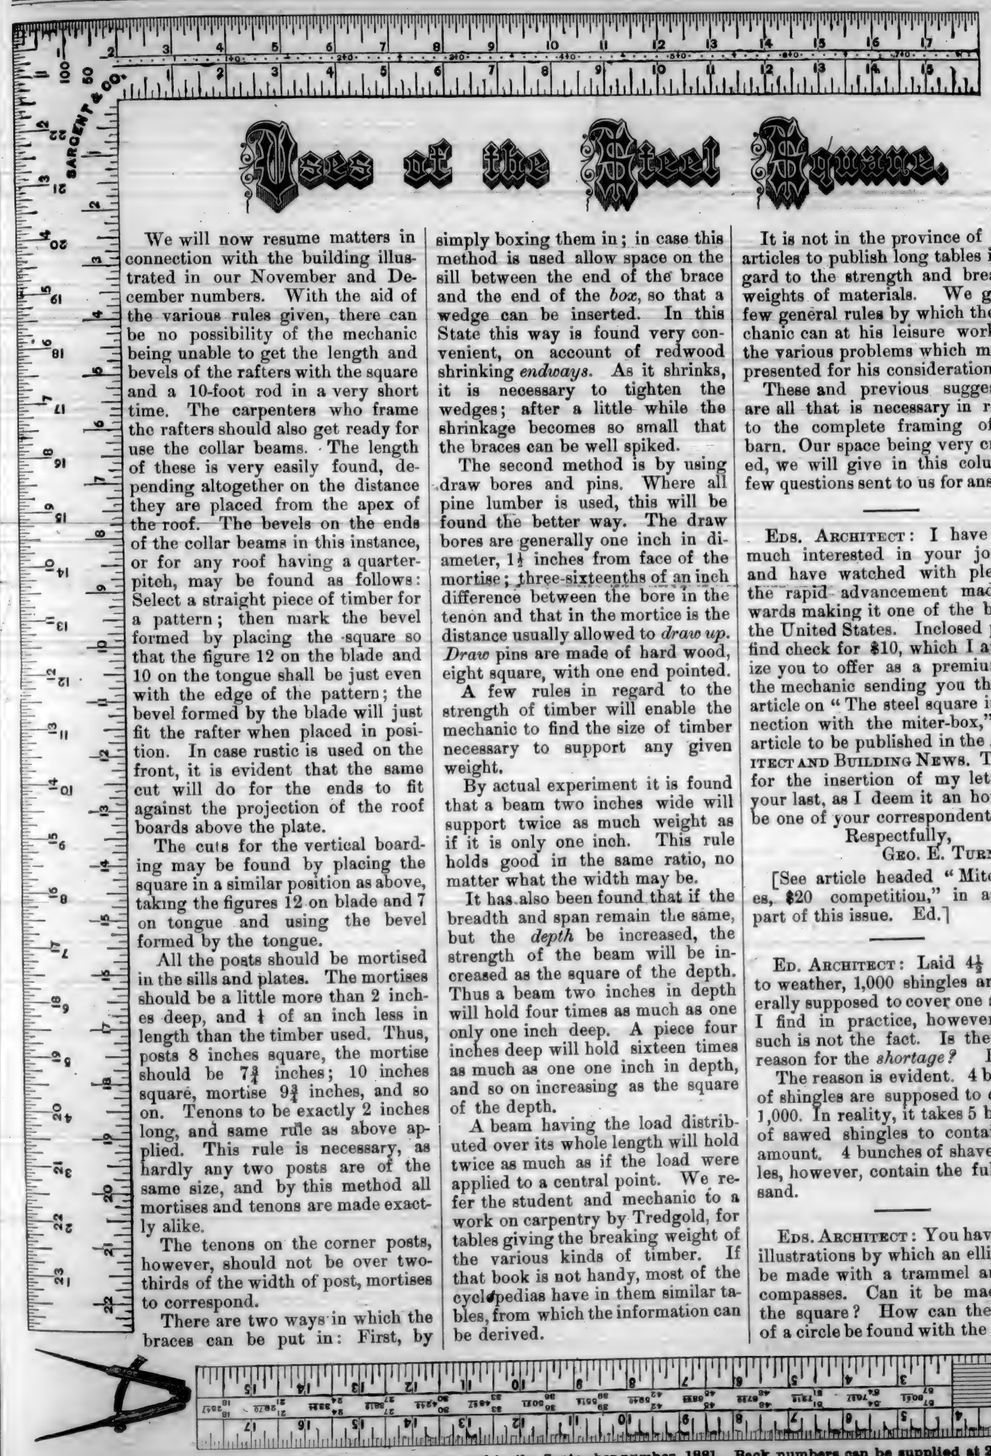
Almost the same argument may be made applicable to the wood-work of every room, and in fact to all the wood-work of a house. The drawing-room may be rendered gay, the library somber, the dining-room comfortable, the smoking and billiard-rooms cozy or airy-looking as desired, the boudoir may be made artistic and elegant. All these effects may be produced by the suitable employment of wood, and the extent of the effect can only be said to be limited by the ability of the designer. And yet these excellent opportunities are often completely neglected, or are at the best only made partial and feeble use of. For the greater part the house painter is allowed to treat the wood-work much as he pleases. It must be admitted that of late years matters in this respect have undergone considerable modification, but the change has been in a way of a negative character only. Design, in respect to form, has again come to the fore; but whilst the painter's services have been partially dispensed with, no substitute for his work has been introduced. And a worthy substitute is ready at hand. Woods of different hues and varying shades, all the tints of which are beautiful and all the shades harmonious, invite the attention of the designer.

It may be thought that architects would not continue to neglect the use of colored woods if the doing so were feasible and advantageous. But there are existent sufficient reasons for the apparent neglect. The fact is, that very little is known concerning fancy woods, and what may be termed "wood literature" is but scantily supplied to us. This is not to be wondered at, for no one other than one possessing a good trade knowledge of the subject could by any possibility deal with it. Theorists do at times attempt criticism, and often enough with absurd results. Woods are by them frequently recommended for use which have no existence other than in the imagination of the critic.

It is not, however, a difficult matter for an architect to acquaint himself with the qualities and appearances of such colored or fancy woods as mahogany, ebony, rosewood, walnut, satinwood, maple, oak, sycamore, cherry, ash, elm, pitch-pine, etc., which may be classed under the category of well-known woods, so that he may design them for use.

There is this high and unique character attached to fancy woods, that as they are beautiful in appearance, so are they correspondingly serviceable and lasting in nature. The least serviceable woods are the plainest; the most beautiful are at the same time the most lasting. Mahogany is the most beautiful wood known to mankind, and it is unquestionably in every respect the most lasting.

If mahogany is held to produce too somber or heavy and effect, then let it be lightened by blending with it some other wood, it hardly matters which, for any two will harmonize perfectly. In that fact alone lies the certainty that our arguments are justified. There can be no discord produced by the alliance of colored woods such as has nearly always been effected whenever the modern house painter has exercised his craft upon mural decoration.—*The Timber Trades Journal.*



Uses of the Steel Square.

We will now resume matters in connection with the building illustrated in our November and December numbers. With the aid of the various rules given, there can be no possibility of the mechanic being unable to get the length and bevels of the rafters with the square and a 10-foot rod in a very short time. The carpenters who frame the rafters should also get ready for use the collar beams. The length of these is very easily found, depending altogether on the distance they are placed from the apex of the roof. The bevels on the ends of the collar beams in this instance, or for any roof having a quarter-pitch, may be found as follows: Select a straight piece of timber for a pattern; then mark the bevel formed by placing the square so that the figure 12 on the blade and 10 on the tongue shall be just even with the edge of the pattern; the bevel formed by the blade will just fit the rafter when placed in position. In case rustic is used on the front, it is evident that the same cut will do for the ends to fit against the projection of the roof boards above the plate.

The cuts for the vertical boarding may be found by placing the square in a similar position as above, taking the figures 12 on blade and 7 on tongue and using the bevel formed by the tongue.

All the posts should be mortised in the sills and plates. The mortises should be a little more than 2 inches deep, and ¼ of an inch less in length than the timber used. Thus, posts 8 inches square, the mortise should be 7¾ inches; 10 inches square, mortise 9¾ inches, and so on. Tenons to be exactly 2 inches long, and same rule as above applied. This rule is necessary, as hardly any two posts are of the same size, and by this method all mortises and tenons are made exactly alike.

The tenons on the corner posts, however, should not be over two-thirds of the width of post, mortises to correspond.

There are two ways in which the braces can be put in: First, by simply boxing them in; in case this method is used allow space on the sill between the end of the brace and the end of the *box*, so that a wedge can be inserted. In this State this way is found very convenient, on account of redwood shrinking *endways*. As it shrinks, it is necessary to tighten the wedges; after a little while the shrinkage becomes so small that the braces can be well spiked.

The second method is by using draw bores and pins. Where all pine lumber is used, this will be found the better way. The draw bores are generally one inch in diameter, 1½ inches from face of the mortise; three-sixteenths of an inch difference between the bore in the tenon and that in the mortice is the distance usually allowed to *draw up*. *Draw* pins are made of hard wood, eight square, with one end pointed.

A few rules in regard to the strength of timber will enable the mechanic to find the size of timber necessary to support any given weight.

By actual experiment it is found that a beam two inches wide will support twice as much weight as if it is only one inch. This rule holds good in the same ratio, no matter what the width may be.

It has also been found that if the breadth and span remain the same, but the *depth* be increased, the strength of the beam will be increased as the square of the depth. Thus a beam two inches in depth will hold four times as much as one only one inch deep. A piece four inches deep will hold sixteen times as much as one one inch in depth, and so on increasing as the square of the depth.

A beam having the load distributed over its whole length will hold twice as much as if the load were applied to a central point. We refer the student and mechanic to a work on carpentry by Tredgold, for tables giving the breaking weight of the various kinds of timber. If that book is not handy, most of the cyclopedias have in them similar tables, from which the information can be derived.

It is not in the province of these articles to publish long tables in regard to the strength and breaking weights of materials. We give a few general rules by which the mechanic can at his leisure work out the various problems which may be presented for his consideration.

These and previous suggestions are all that is necessary in regard to the complete framing of the barn. Our space being very crowded, we will give in this column a few questions sent to us for answers.

EDS. ARCHITECT: I have been much interested in your journal, and have watched with pleasure the rapid advancement made towards making it one of the best in the United States. Inclosed please find check for $10, which I authorize you to offer as a premium for the mechanic sending you the best article on "The steel square in connection with the miter-box," said article to be published in the ARCHITECT AND BUILDING NEWS. Thanks for the insertion of my letter in your last, as I deem it an honor to be one of your correspondents.

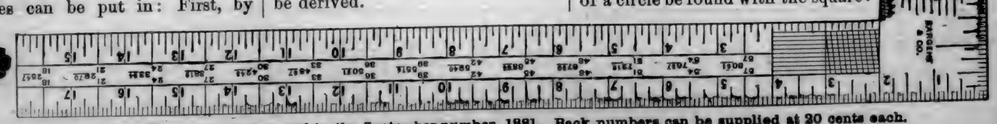
Respectfully,
GEO. E. TURNER.

[See article headed "Miter-boxes, $20 competition," in another part of this issue. Ed.]

ED. ARCHITECT: Laid 4½ inches to weather, 1,000 shingles are generally supposed to cover one square. I find in practice, however, that such is not the fact. Is there any reason for the *shortage?* R. L.

The reason is evident. 4 bunches of shingles are supposed to contain 1,000. In reality, it takes 5 bunches of sawed shingles to contain that amount. 4 bunches of shaved shingles, however, contain the full thousand.

EDS. ARCHITECT: You have given illustrations by which an ellipse can be made with a trammel and with compasses. Can it be made with the square? How can the center of a circle be found with the square?



This series of articles on the square was commenced in the September number 1881. Back numbers can be supplied at 20 cents each.

Felling a Big Redwood.

"The first question, sir," said the leading axman, politely, "when we are going to fall a big tree, is where she'll lay; because unless a man cares (i. e., is careful) to fall her right, she'll break all up, and the bigger the trunk the more liable she is to break. You can see down across the creek how that one snapped."

We looked where he pointed, and saw that a bole fully six feet in diameter, had broken squarely across; the brittleness of this timber, nevertheless, is not excessive, compared with other soft woods. Meanwhile the chopper was holding his ax in front of his unturned face, letting it hang, head down, between thumb and finger, like a plummet, while he squinted past it at the top of the tree, upon whose perfect shaft no branches grew below the upper quarter.

"I can tell by this whether she leans out of the perpendic'lar. If she does, you've got to allow for it; but this one don't, and I guess, Joe, we'll drop her right along that knoll just to the east'ard o' that oak stump—see it? But we'll have to roll that there log out of the way a little, or she'll break her back across it, sure."

Having made this simple preparation (sometimes hours are spent dragging logs to fill gullies, or in leveling knolls and getting stumps out of the way), the men returned and began chopping out some mortise-holes in the trunk about four feet above the ground. These were intended for the insertion of their iron-shod "spring-boards"—pieces of flexible planking about four feet long and six inches wide, upon which they were to stand while chopping at a height too great to reach from the ground.

The undercut was made first, and it was a fine sight to watch these stalwart men perched upon their strips of springy boards, hurling their ax-heads deep into the gaping wound, and never missing the precise point at which they aimed. I do not know any attitudes more manly or motions more muscularly graceful than those of the chopper; but perhaps the noble surroundings may count more largely than we think in this estimate.

In about an hour the undercut had approached the heart of the tree, and the men desisted from their work, which must now proceed on a scientific basis.

"As I said afore," the chopper explained, "we must fall a tree straight and true where we've fixed for it, or else she'll go to pieces. In order to do this we've got to measure it this way."

As he speaks he picks up, from near where his coat and saw and water caddy are lying, two sticks about four feet in length—one a square stiff lath, the other switch-like. Going to the tree he lays one end of the lath upon the partially exposed stump in the undercut, its extremity resting against the heart of the wood at the exact center of the bole. Then stooping and sighting along it, he moves the outer end of the lath until it points exactly along the line where the trunk is intended to be thrown.

"Joe, go out there a hundred feet or so and set a stake; I want to show these gentlemen how nicely we can drive it in with this big sledge we're goin' to let loose directly."

"Do you mean to say you will drop your tree as accurately as that?"

"You bet—hit that stake plumb; 'n' it'll take more mumble-te-peg 'n you're worth, I reckon, to pull it out afterward."

Meanwhile he went on with his mathematics. Having aimed the lath, he measured with his switch from its outer end to the "corner" at each side of the undercut, and finding one side a little shorter than the other, chopped in until he had equalized the hypotenuses of the two right-angled triangles whose straight sides were back to back in the line of the lath. The object and importance of this was to make sure that the limit of the undercut, where the strain and breakage controlling the fall of the tree (and marked by the line of upright slivers in a stump) would finally come, should be at right angles to the intended direction of that fall.

The axes were laid aside, and the spring-boards inserted in new mortises behind the tree, and a big two-handed saw set at work to make the overcut. Soon the crevice begins to open a little, and then a little more, until the cautious woodmen begin to cast their eyes aloft, watching carefully the signal that the next stroke would be the last, cutting the one remaining tendon that holds the mighty column up, for already there are sudden strange shivering motions in the densely bushy thickets of foliage that adorn its lofty crown, and dead twigs rattle down, snapped off by thrills of approaching destruction.

Then comes the final stroke of the ax, severing the last slender stay, and, with a mingled roar and scream of frightened despair, the huge mast, carrying all its lofty spars and well-set rigging, slowly leans to its fate, gathers headway, spurns with giant heel the faithless stump which hitherto has borne it proudly against every gale and torrent, and so, stately to the last, "rustling, crackling, crashing, thunders down."

Picking our way through the settling dust and *debris* of crushed branches which lie in a thousand splinters of red and green around the head of the prostrate chief, we look for the stake with which Joe challenged our credulity, but failed to find it, for it has been driven "plumb through to China," as Joe avers.—*Harper's Magazine.*

Black-Walnut Furniture.

Nearly all persons are aware of the enormous prices that have been paid during the past few years for black-walnut lumber. This wood has been in demand not only for making nearly all kinds of furniture, but for inside finishing for houses. The fashion for this wood started in the United States, spread rapidly to other countries, and now it is in active demand in every portion of Europe. During several years past fortunes have been made in buying land covered by black-walnut timber or the "stumpage," cutting down the trees, and sending them to market. Some persons have realized large sums by selling trees that were standing on portions of their farms that had not been cleared. In some instances old stumps have been sold at very high prices for veneering. Parties have gone over every part of the country in search of black-walnut lumber. Thousands have regretted that they cut down trees and used them for fuel or fences, or simply destroyed them as "cumberers of the ground." They now see that they could have realized a fortune if they had not been so hasty in their proceeding. The fashion for black-walnut furniture and finishing, which became prevalent suddenly, shows no signs of abating. The demand for the wood becomes greater as the supply becomes limited. It is transported hundreds of miles on wagons and in railway cars. It is the favorite of the maker and the buyer of furniture. Most persons prefer it to mahogany, which for centuries was the fashionable wood for decorative purposes. That it contains several desirable qualities is certain, but it is equally certain that its qualities have been greatly overrated.

The prices of black-walnut lumber is so high and the supply of it so small that the owners of land have been exhorted to engage in the culture of the trees to meet the demands of the near and distant future. Parties have figured out how much can be made by planting a given number of acres with these trees, and giving them suitable care and attention for a series of years. There is no accounting for tastes, and the origin of most fashions is obscure. Fashions come and go, and in most respects they are as unreliable as the wind. Black-walnut was first used as a cheap substitute for mahogany. It soon became its successful rival. It does not follow, however, that it will remain so. Indeed, it is very likely that mahogany may soon occupy the place it long filled, and that it will not soon be displaced. It is also likely that woods of light color will become fashionable, to the partial and complete exclusion of those that are dark. They "had their day," and perhaps may have it again. It is likely that at no very distant period improvements in "stuffing" porous woods may result in making much material valuable that is now regarded as entirely useless in the arts.—*American Lumberman.*

Important to Architects.

A question is asked in *La Semaine des Constructeurs* which is not unfrequently heard in this country, and the French opinion on the subject is of interest to all architects. It seems that a proprietor invited estimates from a number of contractors for the execution of a monument, after plans and specifications prepared by his architect. The work was not carried out; and one of the contractors sent to the proprietor a demand for payment for his trouble in making the estimate. The correspondent inquires whether he is entitled to receive such payment. To this the editor of *La Semiane* replies, that the fact of the submission of plans by a proprietor to a contractor, and an inquiry as to the sum for which he will carry them into execution, does not legally imply any engagement of that proprietor with the contractor. The process is simply an ordinary consequence of the custom of competitive bidding. The contractor knows the risk, as well as the advantage, of responding to the invitation to submit an estimate, and he is free to do so or not as he chooses. If he chooses to make a tender, he can only do so intelligently by studying the plans, and this he does for the sake of making the offer, and not as a favor to the proprietor.

Another question of some importance is also answered in *La Semaine des Constructeurs.* It appears that a certain church was in process of construction or repair, under the direction of an architect, who had made proper calculations, and had taken the necessary means, for insuring the stability of the edifice after its completion. During the progress of the work certain canters, placed to support the arches temporarily, failed, and the building was injured. The point to be determined is, whether the architect or the builder should be held responsible for the accident. The reply to this is, that as a general principle the contractor is alone responsible for defects in execution, and the architect for vices in the design. The contractor is supposed to know, better than the architect, the order in which the several portions of a construction should be carried out; he is expected to understand the modes of preventing injury or failure in *unfinished* work; he is constantly present, in person or by deputy, to direct the operations in progress, and is relied upon to watch effects and supply remedies. The architect, on the contrary, so far as regards his plans, is concerned only with the finished work, and if that is designed in accordance with the laws of stable equilibrium, his duty in relation to the plans is fulfilled. If, being present at the work, he should give wrong directions, he would have at least a share of the responsibility to bear, but in his absence the contractor is certainly bound to pursue his operations in accordance with the rules of his own art. For these reasons *La Semaine* decides that the contractor alone should be held responsible for the damage caused by the insufficient centering or other temporary support which caused the fall of the arch.—*American Architect.*

Our Illustrations.

Plate 1 presents the elevation of a 6-flat house that can be built on a lot having a frontage of 38 feet. This width can be varied a little either one way or the other. The main essentials considered are neatness and economy. A rather novel design is shown in the arrangement of the front doors for the first and second stories, all opening on the same vestibule, and yet each one perfectly distinct.

Plates 2 and 3 show the arrangement of the first and second floors. It will be noticed that it is necessary to go through a bedroom in order to reach the kitchen, in the two first-story plans. Without a hall, this cannot be helped—on the width of lot shown—unless by a sacrifice of too much room. As the "flats" are designed for a small family, for the sake of economy, a little inconvenience will sometimes have to be endured. The use of the passage-way in the basement flats, mentioned below, obviates this difficulty as far as the members of the family are concerned.

The second story, as shown, is as well arranged as the space will permit, and presents unusual conveniences in this class of house.

All the rooms in each separate tenement are well supplied with closet room, light, and ventilation; in the latter two requisites they are susnperior.

The arrangement of the basement will readily suggest itself from a study of the other floors. These flats as shown can be built for $6,000 to $7,500, according to finishes used. The aggregate rental of these flats as shown will not be less than $120 per month, and for the cost offer superior inducements to capitalists. If strict economy is considered, a bath-room on each floor could be dispensed with; one window in each small bedroom could be made to answer. These flats can be built with or without a basement. In the latter case the entrance to the yards can be readily conceived. If the basement is used for flats, a passage-way four feet wide can be made directly in the center of the building. This will enable each occupant to have all supplies brought in from the rear.

Plate 4 and the two in connection with it show the elevation and plans of a neat and substantial suburban residence of 7 rooms and bath. The plans are sufficiently plain, without explanation being required. It can be built as shown, with rough basement, for $2,700 to $3,500, according to details used.

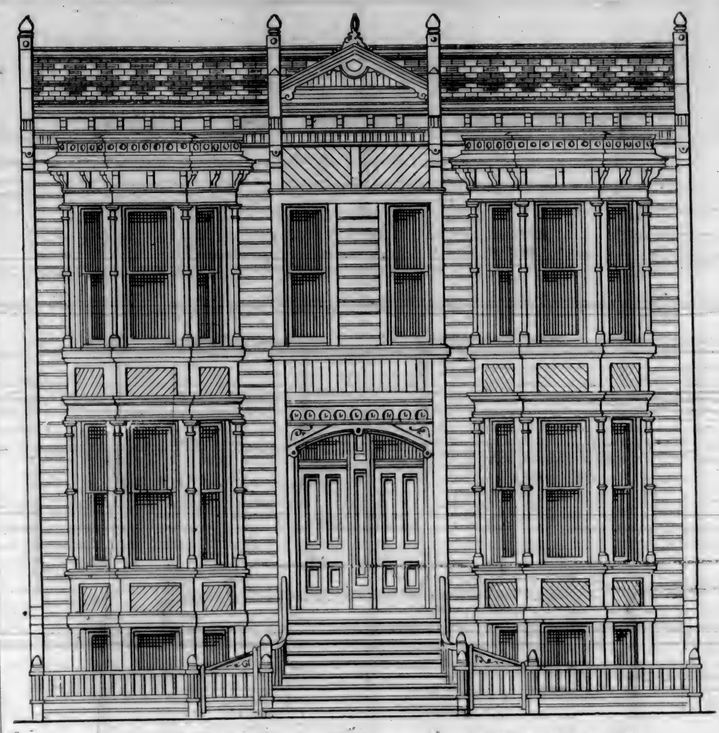


PLATE 1.—ELEVATION OF DWELLING CONTAINING SIX FLATS.
See "Our Illustrations."

Recipe for Luminous Paint.

For making luminous paint the following has been given: Take oyster shells and clean them with warm water; put them into the fire for half an hour; at the end of that time take them out and let them cool. When quite cool pound them fine, and take away any gray parts, as they are of no use. Put the powder in a crucible with alternate layers with flour or sulphur. Put on the lid and cement with sand made into a stiff paste with beer. When dry, put over the fire and bake for an hour. Wait until quite cold before opening the lid. The product ought to be white. You must separate all gray parts, as they are not luminous. Make a sifter in the following manner: Take a pot, put a piece of very fine muslin very loosely across it, tie around with a string, put the powder into the top, and rake about until only the coarse powder remains; open the pot and you will find a very small powder. Mix into it a thin paint with gum water, as two thin applications are better than one thick one. This will give paint that will remain luminous far into the night, provided it is exposed to the light during the day.

Augers.

A writer says: "The first boring-tool may be assumed to be an awl of some kind. Pliny states that Dedalus invented the gimlet in 1240, B. C. It was destitute of a screw point, but it may have had a hollow pod, and a crosshead forming a handle. Awls are shown in Egyptian tombs of 1706 and 1490 B. C. The screw point was added to the gimlet in course of time, and within our own recollection, the twisted shank, which makes it self-discharging. The hint was taken from the auger proper, which may be called a magnified gimlet, now that their specific features have become closely assimilated in form and function. The auger (*terebra*) was a Greek tool.

"From the early descriptions the auger seems to have been considered a shipwright's tool. It formerly had a curved, sharpened end, and a concavity to hold the chips; this was a *pod* auger. To this a lip was subsequently added for some kinds of boring, and in course of time the depression grew into a spiral, which allows the chips to escape while the boring proceeds, instead of withdrawing the tool as the pod becomes filled. The *twisted auger* is an American invention, and was made by Lilley, of Mansfield, Conn., about the beginning of the present century, and afterward by Gurley of the same place.

"Augers may be classified as augers, annular augers, taper auger, augers with secondary bores, reamers, or countersinks, or having expansive cutters."

Musty Smells in Untenanted Houses.

It is a cause of much wonder among those who do not study the subject, why a comparatively new house, after being in use a short time and then left vacant a few weeks, should be so impregnated with bad smells and foul atmosphere as not to be endurable for habitation until the house has been thoroughly ventilated.

A little study will lead one to soon arrive at the reason for such musty odors. The parties last inhabitating the house may have left it in perfect order according to their ideas of cleanliness; as far as outward appearance was concerned, nothing could be detected to lead any one to suppose that the *musty smell generator* would soon be in running order.

We can best illustrate the *modus operandi* of these *generators* by the following description as furnished us by the owner of the premises: "The house had only been built a little more than a year. At the expiration of that time it was to undergo a thorough change. A servant was left to sweep out and clean up generally. After a thorough (?) sweeping, the windows were washed and the almost muddy water dumped into the kitchen sink instead of being thrown into the yard hopper. The shelves in the pantry were washed, and the water also emptied in the sink. Instead of letting a bountiful supply of water run, that the trap might be thoroughly cleansed of filth, the girl simply used the cloth in brushing the water down the sink and forcing the thicker portions through the strainer.

The same thing was done up-stairs; windows and shelves washed and the dirty water dumped into the wash basin, a cloth used to wipe the basin clean, and all was right. We prefer not to put in print what took place in the bath-room. To all appearance the house looked clean. The servant went through the house, shut and locked every window and left the death-dealing *musty smell generators at work.* My advice to leave the windows open were not regarded, and as the time would not be up for several days for me to take possession of the premises to make the necessary alterations, I had no authority to leave the windows open.

Of course the gas fiend was soon at work The filth left in the traps, the dirt on the shelves, wet and but half washed, etc., soon began to putrefy; the absence completely of fresh air from the windows being closed, helped on the decaying mass, and a lively ferment took place. With such generators of musty and foul vapors, is it any wonder that in a short time the house was filled with a noxious atmosphere." We are sure, when we visited that house some days afterwards, even after sending a boy the day beforehand to open the windows all through the house, that we were met with, on opening the door, a smell that put us in mind of a certain story where a river had to be turned from its course in order to purify certain stables.

Landlords would be well paid after a tenant has left a house, to immediately give it a thorough sweeping; allow the water to run several minutes in all the sinks, basins, and water-closets; if there be a cellar, see that not a particle of vegetable matter is left around; leave a window in every room open; scatter a little chloride of lime in the cellar, and place some in a saucer in the bath-room and kitchen. It will take you but a few hours to follow these suggestions, and only a few dimes' worth of materials to carry them out. Your house, even if idle for quite a time, will be sweet and wholesome, and the little labor you have spent will be well rewarded by the praises of your new tenants upon the nice clean house they have secured.

It is estimated that there are about 6,000,000 feet of lumber used in the manufacture of toys in the United States yearly.

Interesting Information About Saws.

On few points connected with wood conversion is there more difference of opinion than the question of speeds. Commencing first with circular saws for ripping, for sawing soft and medium woods, a speed of 9,000 feet traverse per minute at the points of the teeth may be taken as a standard speed; if hard wood has to be sawn, this should be reduced to about 7,500 feet per minute, and with very hard wood 6,000 feet per minute will be found sufficient. The shape, number, pitch, and set of the saw teeth being modified to suit the nature of the wood.

In one experiment I put a circular saw, 30 inch diameter and 12 gauge, on a spindle and gradually increased the speed to between 12,000 feet and 13,000 feet per minute, when it became wavy and pliant and ran out of truth. It therefore follows that, not only is the extra speed entirely unnecessary, but it is positively detrimental, as more power is consumed, more heat engendered in the bearings, spindle, and saw-plate; extra lubrication is therefore required, and the belts deteriorate more rapidly. I should, however, prefer to err on the side of high speeds instead of low, as this necessitates perfect workmanship and finish not always found in these days of so-called "cheap" machinery.

The speed of circular saws for cross-cutting can be increased with advantage 1,000 feet beyond those used for ripping, say to 10,000 feet per minute. The difference in the cutting action of the two kinds of saw teeth will readily account for the necessity of this increase in speed. In the case of a ripping saw the action is chiefly a splitting one, the saw teeth acting like a series of small wedges, driven into and separating the longitudinal fibers of the wood, while the cross-cutting saws the fiber of the wood has to be severed across the grain, is comparatively unyielding, and the teeth of the saw meet with much more resistance. It is found necessary to make the teeth considerably more upright and more acute or lancet-shaped in their form than for cutting with the grain. Although the subject is one of great interest, time and space forbids extended remarks, and I pass to band-saws.

Owing to improvements in the manufacture of the blades and the machines themselves, the speeds of which it is safe to run band-saws has increased considerably of late years. On machines in which the saw-wheels are of small diameter, say below 36 inches, and where the arc of contact of the saw on the wheels is necessarily more acute, the speed of the saw-blade should not much exceed 4,500 feet per minute. With saw-wheels above 39 inch diameter this speed may be safely increased up to 6,000 feet per minute; this is, however, on the supposition that the saw-blades are of good quality, and that the top saw-wheel is mounted elastically, and that the machine generally is well designed and made. The proper construction and use of saws involves many important and scientific points that are unfortunately much neglected, resulting in an enormous waste of material and power.—*Mechanical World (English.)*

Any one who will call to mind the condition of the permanent way of our railways say ten or twelve years back cannot fail to be struck with the great improvement since introduced in the matter of the quality of the sleepers laid down. The waney sleepers have almost departed, and not only are the cubical contents of the modern sleepers greatly in excess of those which they superseded, but the number of them used in a mile of track has been enormously increased.

The demand for California redwood in the East is increasing. It takes a good finish, and presents a good effect.

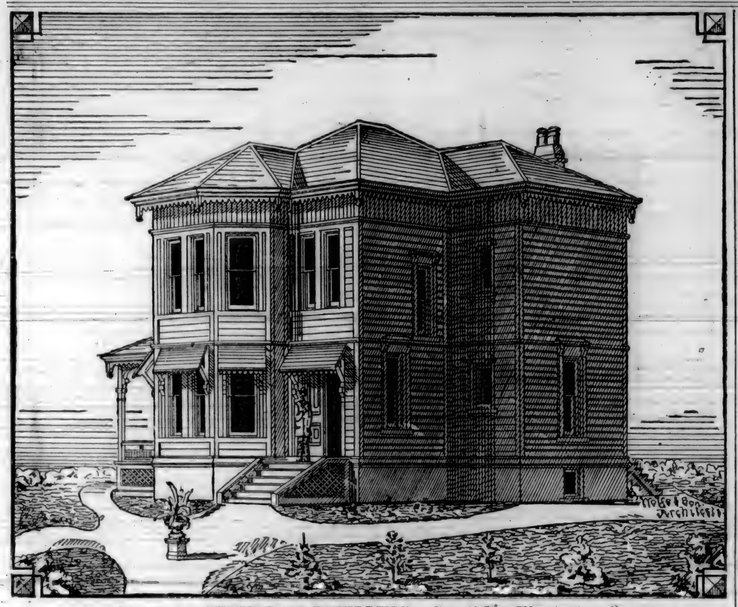

PLATE 4.—SUBURBAN DWELLING. See "Our Illustrations."

American Pyramids.

It is the generally accepted belief that the Egyptian pyramids are the only structures of the kind in the world that have any magnitude, and their existence in the Mediterranean region, that was for centuries the focus of civilization, has made them famous throughout the world. It is nevertheless true that the American continent contains at least one such monument of civilization probably as ancient as that of Egypt, and related to it ethnologically, which far surpasses the famous pyramids of that wonderful country. The great pyramid of Cholula, in Central America, is undoubtly one of the greatest constructions ever reared by human hands. Even in its present ruined condition, it is 160 feet high, 1,400 feet square at the base, and covers an area of 45 acres. The largest of the Egyptian pyramid—that of Cheops—is 461 feet high, and the length of its base 476 feet, and it covers 11 acres of ground. In comparison, some conception of the magnitude of the American structure may be formed.—*The Manufacturer and Builder.*

Miter-Boxes. $20 Competition.

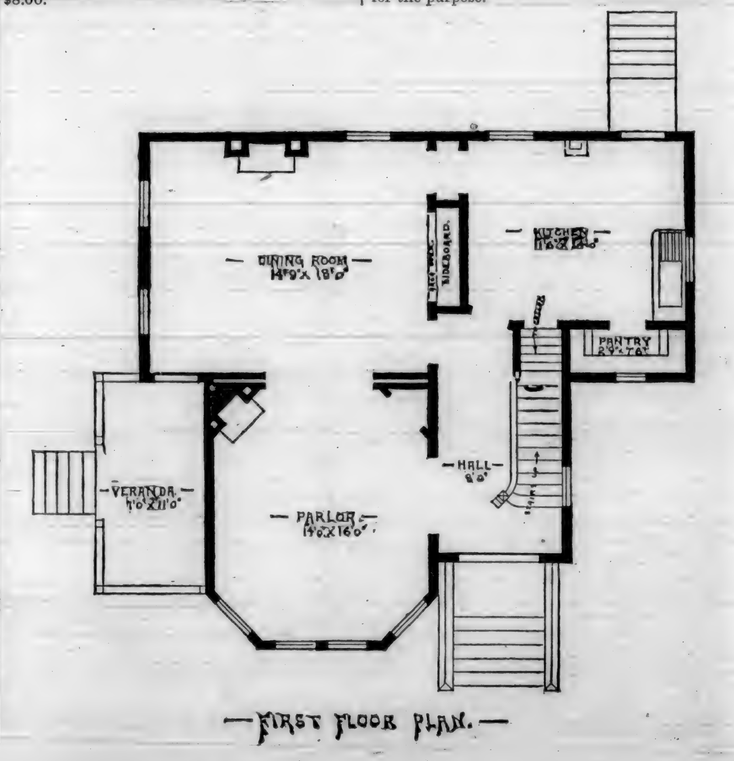
In another column we publish a communication from Mr. George E. Turner, offering $10 for the best article on miter-boxes, and the use of the square in connection therewith. We will add $10 to the above, thus making a premium of $20. His offer is limited strictly to mechanics, and is open to them in every part of the country.

We sincerely thank Mr. Turner for his generous offer; he has been in the State but a short time, and has already shown himself as one well worthy of recognition by his fellow-mechanics. We trust that in the future the mechanics on this coast will emulate Mr. T.'s example, and send us articles of practical information for publication.

That all may have a chance to gain the above premium, the offer will remain open for three months.

THE ARTIST'S ALBUM.

A large work, beautifully illustrated; will be forwarded to any address, upon receipt of price—$8.00.



—FIRST FLOOR PLAN.—

Steel Square and its Uses.

BY F. T. HODGSON.

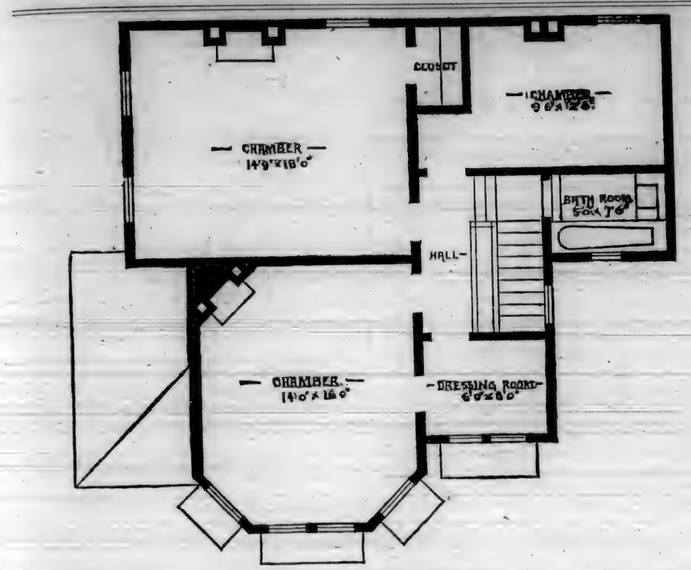
We have just received a large consignment of this valuable work by the above author. It has been enlarged, and now contains about 100 pages. Many new rules and methods are given that have not formerly appeared in print. The price is fixed at $1.00. The old edition is almost completely exhausted, and no more will be printed. We have only a few left of the smaller edition. Price 75 cents.

The author takes a just pride in desiring a copy to be in the hands of every mechanic in the United States. In order that all may possess themselves of this work we will send the CALIFORNIA ARCHITECT AND BUILDING NEWS for one year, and one copy of the enlarged edition of the STEEL SQUARE AND ITS USES, for the sum of $2.50.

The Value of Trees.

The Aztecs, before the conquest of Mexico by the Spaniards, recognized the value of trees to a country for the maintenance of moisture and the promotion of irrigation. Prescott, in his history, tells us that their law contained seven penalties against the destruction of the woods, which they deemed necessary to secure the means of maintaining irrigating canals.

An important alteration has been effected in respect to the selection of figured woods for pianoforte making. Italian walnut, once so universally used, has been to a great extent superseded by rosewood, and many other woods are now employed which were never before used for the purpose.



—SECOND FLOOR PLAN.—

American Architecture and Plumbing Seen Through English Eyes.

American architecture and plumbing were highly praised at a recent meeting of the Royal Institute of British Architects. The author of the paper, A. J. Gale, arrived in the country early last summer, and spent some time in the study of representative buildings in the principal cities. Mr. Gale came prepared to find American work much inferior to English; it is evident from his paper that he returned to England with a different impression. What was, perhaps, most surprising to him was the wonderful completeness of American houses and the elaborateness of their construction. He found American clients willing to pay for any comfort that could be procured.

In this city he devoted much attention to the work of the Board of Health and the improved tenement houses. The apartment houses were also a marked feature of the city. They were enormous blocks of buildings seven or eight stories high, and since 1879–80 had been strictly regulated by the New York Board of Health, some particulars of which organization were given. All classes of apartments houses were subject to the same regulations, and were constructed on much the same plans and lines, but in some a great amount of luxury was afforded the tenants. The entrance halls opened upon elevators with cushioned seats, and running very easily, and the buildings surrounded a court-yard, covered in the best examples. The walls were of brick, and the roofs of iron covered with slates, the staircases of iron, and the floors of iron bedded in concrete, and laid with two thicknesses of boords. The finishing of all woodwork was excellent, and the joinery was superb, and constructed in a great variety of woods. Some of these dwellings were erected by mutual associations, who thus preserved some power of choice of tenants, and in many cases the choice of apartments were put up to auction. During the past year the plumbing arrangements had been regulated by the Board of Health, and the rules were fairly representative of American public opinion on the matter. A curious feature was that the soil-pipe was usually of iron, coated inside and out with enamel or coal-tar pitch. The use of iron allowed the pipes to be suspended from the cellar roof. Lead was condemned as being less smooth, more liable to corrosion, and less easy of jointing. Indeed there was a general thoroughness about the use of iron pipes which was in advance of English practice.

The ventilation of buildings was, in many cases, very perfect, and he specially studied Dr. John Hall's Church (Fifth Avenue Presbyterian), New York, of which M. Carl Pfeiffer was the architect. The building measured 200 feet by 100 feet, and was 60 feet high, being seated for 2,000 persons. Two towers, each 100 feet high and 60 feet square, formed inlets and outlets for air. The incoming air was received in basement, and in cold weather passed over a set of steam pipes some 9,000 feet long suspended from the ceiling, the whole basement being thus converted into a heating chamber. The warmed air came up into the pews and could be regulated by the occupants. Twenty-four hours before the service the steam pipes were heated, and throughout the Sunday a powerful fan was rapidly rotated in the outlet tower, drawing off the vitiated and heated air. The windows were all double and the gas burners protected in glass niches. In summer time the incoming air was passed over ice. A steam pump and fire hydrant were provided to prevent accidents. Madison Square Theatre was ventilated and warmed, or covered, by somewhat similar apparatus.—*Sanitary Engineer.*

New Books Received.

From the house of John Wiley & Sons, 15 Astor Place, New York City, we have received copies of the following works:

The Materials of Engineering.

Steam Heating for Buildings.

Saw Filing by Grimshaw.

These works are new, and being *standard* publications, should be found in the library of every Engineer and Mechanic on the Coast.

EXTRA INDUCEMENTS

TO

SUBSCRIBERS FOR 1883–4,

TO THE

California Architect and Building News.

We will send either of the following journals for one year in connection with the CALIFORNIA ARCHITECT for the amount opposite their names:

	Price of paper alone for one year.	Price of paper and CAL. ARCH and B. N.
American Architect (weekly Ed.)	$6.00	$7.00
" " (monthly Ed.)	2.00	3.50

Any one sending us the names of three new subscribers, with $6, will receive a copy of the CALIFORNIA ARCHITECT AND BUILDING NEWS free.

Any one sending us the names of ten new subscribers, with $20, will receive a copy of the CALIFORNIA ARCHITECT AND BUILDING NEWS free, and $5 worth of books selected from the above list.

A club of twenty-five new subscribers entitles the sender to a copy of the CALIFORNIA ARCHITECT AND BUILDING NEWS, and $20 worth of books selected from the above list.

The Antiquity of the Grindstone.

The quaint illustration shown with this article will be scanned with interest by all our mechanical readers. It represents a mechanical tool that has come down to our day, with little alteration, from the remotest antiquity, its origin dating far back to the times when men first learned the art of working in metals, comparing, in respect to age, with that other venerable heirloom of antiquity—the potter's wheel. Our illustration represents a grindstone of the sixteenth century, and is taken from an ancient work printed by H. Schopperum, at Frankfort-on-the Main, in the year 1548; and in connection with it, it will doubtless prove interesting to add some remarks respecting the history and uses of this indispensable mechanical agent.

For the use of the illustration we are indebted to Mr. J. E. Mitchell of Philadelphia, from whose admirable pamphlet on "The Grindstone" we obtain the material for the following historical and mechanical summary:

In the whole range of mechanics, with all modern developments and enlarged capabilities, there has been applied no mechanism nor process yet able to supersede the grindstone in its peculiar office. It is the one thing in mechanic arts that improvement has not added to or invention displaced; while the pruning hook and plow are of equal antiquity, the spirit of improvement has touched both, but left the grindstone unchanged. Its utility in the early ages was great, and science has not lessened its value any by its perfection of other means for like results. It has been found in use among uncivilized people, and yet has its place with nations most advanced. Writers of fiction knew it would not conflict with the appearance of truth to ascribe it a place among barbarians. It is among the few implements of handicraft mentioned in Scripture, though there only named for milling purposes; it is the same in form and in universal use—a round revolving stone. In a scriptural research for the articles of handicraft mentioned then, we can look through the "eye of a needle" and find the grindstone beyond, its origin lost in the darkness of antiquity. It is not meant to confound the millstone of antiquity with the grindstone of to-day, which the encyclopædia mentions as "a flattish circular stone of various diameters, employed in the cutting and sharpening of edged tools, precious stones, etc., and the grinding of steel, glass, pottery, and the like. They are made of sandstone, or sandstone grit." The grindstone now has scarcely a wider capability or greater usefulness than when we first hear of it. Although limited as its qualifications may be, it serves its purpose as nothing else can. Improvement has furnished us wheels of composition, which only to some extent serve some of its purposes, but the grindstone still remains unsupplanted. It is a tool of the utmost nicety in proper hands and properly understood, and is capable of performing with speed and precision its limited agency, beyond the powers of any modern tool. It is perhaps found best handled in its purpose of grinding dies for cut nails, where its proper use constitutes an occupation not to be attained very perfectly by a short apprenticeship with it. That known as the "bead stone," used by makers of cut nails, is a tool of the utmost perfection of workmanship, not to be meddled with by the inexperienced, however lightly, without the result being noticed by the eye of the experienced nailer. The milling machine, the planer, the file, the lathe, and the emery wheel do much of the work of the grindstone, but it still performs to perfection its needful though limited purposes. The importance and nicety of it, as a means to a purpose, is only known by those who know how to prepare and keep it in order.

Its utility or importance could not be guessed at were one to look at a crooked and badly kept grindstone; but in the hands of those who know its merit, with its even surface running as true as any turned wheel, it will perform work with a rapidity and precision attainable by no other means. In the hands of those who are learned in its use and keeping, it is capable of adaptation to intricate and fine work; but with those who do not understand it, it is rude, and the very opposite of what the educated craftsman would select for any purpose of fine employment.

An heirloom of antiquity, but used among us as we received it, and without any attachment or improvement; capable of its complete functions only when well kept and well applied, and this is only found with those whose craft education is solely to handle it. It alone can cut and shape expeditiously that which is prepared to cut and shape all other hard materials—cast-steel hardened. It is still employed to give the finest edge, the most even surface, the brightest polish, and is the quickest to accomplish it. The emery wheel does but a few of its purposes, and nothing that we have could supply its place. The file has its own peculiar uses, but in contact with the grindstone its thousand small-cutting edges would be reduced to polished plainness. It is found a necessary implement on the farm, and is still required where the finest instruments are made, or the hardest of metals are worked. It has come to us as we have it, and in all likelihood will pass on down to other ages the same—a simple circular stone, swiftly revolving on an axle.

It accompanies those who "go down to the sea in great ships," and moves along the frontier with the advance of civilization. All nations use it, and it is perhaps with all the one piece of mechanism that bears the same form and is the same in principle. More or less directly it takes part in the greatest modern material enterprises; it has no doubt assisted to fashion the implements of many of the lost arts, and is still needed in many of the requirements of arts of the present day.

As ages revolve and invention gives to the world new devises, may it be found more the agent in forming the plowshare and pruning hook than in sharpening the sword.—*The Manufacturer and Builder.*

Prof. Moos, of Heidelberg, has found good reasons for believing that many railway accidents have been due to defective hearing on the part of engineers, or others in charge of trains. Expert medical testimony shows that railway employees are especially liable to affections of the ear.

Paper Rails.

Wooden rails are used on some tramways, but the latest device is the formation of wood into paper for rails to take the place of steel or iron. It will be hard for the skeptical reader to swallow all that is said about this new enterprise, of which the following is a summary:

It is well known that one of the best materials for car-wheels is paper. It is now stated that paper can be utilized for the manufacture of rails, in place of steel, which has almost displaced iron. It is said in favor of the new materials that the cost per mile will be less by one-third than that of steel, and it will last much longer, being almost indestructible. There is no expansion or contraction from heat and cold, consequently no loose or open joints; and, being so much lighter than steel or iron, the rails can be made longer and connections perfectly solid, making the road as smooth as one continuous rail. The adhesion of the drivers of the engine to this material will be greater than that of steel, consequently the same weight engine will haul a larger load. There will be a great saving of fuel, and the smoothness of the rail will lessen the wear and tear of rolling stock. The rails are made wholly and entirely of paper, and so solid that the sharpest spike cannot be driven into them. The action of the atmosphere has no effect on it, will neither rust nor rot, and, with paper wheels and rails of the same material, our palatial trains will glide over the prairies at the rate of 60 miles an hour with as little jolt and jar as on an ocean steamer.

The above is a sanguine view of the virtues of paper rails, but it is a tall story. The accomplishment is, to say the least, a trifle doubtful. In the first place, there is literally no such thing as a paper car-wheel; the office of paper is merely to furnish filling, the plates and bands being of iron. If the friction and pressure were applied to paper direct, it could never stand a fraction of the grief to be encountered. It is hardly more probable that a paper rail could do any more. If it is an iron or steel rail on the half shell, stuffed with *papier mache*, it may be different, but a chunk of paper that will turn the point of a spike must be in somebody's mind.—*Northwestern Lumberman.*

The *Journal of Decorative Art*, in discussing the evils of sewer gas, calls the attention of householders to the fact that it is easy to discover its presence by utilizing the fact that it acts upon the white lead paint in such a manner as to dissolve it; and remarks that the test can be rendered complete and effective, if a portion of the woodwork were painted with silicate paint the same shade; because, resisting as it does the action of the gas, it would serve to emphasize more strongly any discoloration that might take place. As an experiment we would suggest disks being made and painted pure white with white lead paint, and across the center a band of white, of silicate or "Charlton White" painted on them. These hung up in the bathroom, w. c., or cellars, or in such places as are suspected of being inlets for sewer gas, would soon discover if there was any such gas present, and disclose the danger at once.

Wall paper should not, in the opinion of Dr. Baker, who read a paper on the subject at the recent gathering of scientists at Montreal, be manufactured in a manner to be air tight. He says that, hygienically considered, the walls of a house should be porous like our clothing, having free intercourse with the open air. He thinks that waterproof paper causes increased dampness of the walls, as a stoppage of a circulation of air prevents their drying. This prolonged dampness of the walls he considers unhealthy, and productive of other evils. Dr. Baker advocates the old-fashioned white-washed walls instead of wall paper or their substitutes. —*American Artisan.*

Practical Mechanics.

THE SAW BENCH.

No repair shop can be complete without a saw bench, one that can be used for cutting up and splitting, rabbeting, and grooving, and with the aid of a few *traps*, be made to rough out and bring into shape almost any kind of a job in this department. I wish to write just a word about what can be done with just the saw alone, leaving the *traps* for some other time. I prefer, for my use, a saw bench made of hard wood, with the table projecting over the framework, to enable me to clamp on any arrangement I please, and by means of a screw to raise and lower the front end. This bench can be made, by almost any workman, in two days, and you will have no cast-iron table or framework to keep you from driving nails or screws, or making holes and slots, for whatever purpose you choose. The belting, too, should be from beneath. If we must belt from overhead, use a counter shaft, set so as to give the use of the table in every direction. The form or outline of the slot or groove made by the saw not only depends on its size and the position it occupies on the saw arbor, but on the direction the material being worked is also moving. If we take a block of wood and move it across the bench lengthwise, the saw will simply cut a slot in width equal to the *set*, and the depth depending on the height of the table. If we drive the block at right angles, or square across the table, a groove will be formed having a cross section in the shape of a segment of a circle. Any other direction will give us a similar part of an ellipse.

Fig. 2.

In Fig. 2 is seen a variety of work cut out on this principle. No. 1 is a block to be fitted up for lagging to a pulley. It is hollowed out by passing over the saw No. 7; it is then beveled, grooved, and the corners trimmed, and is all ready for the pulley, like either No. 2 or No. 3. The sections 5 and 6 simply show what may be done on the same saw. Nos. 8 and 9 are small, half-round, hollow blocks, which are used in many places in cotton mills, and can be finished entirely on the saw bench by taking three or four in one length at a time. Blocks like No. 10 are often required, and I have seen a workman work for days on them by hand, give it up, and then try the same job over again on the saw bench, roughing them out and fitting them up in a few hours with pleasing accuracy. When it is required to cut a circular groove of a given size at a saw bench, the table can be raised and the saw gauge set to the proper angle

Fig. 3.

by means of the diagram shown in Fig. 3. If it is required to groove out the block A to the line C A D, on the saw bench, using a twelve-inch saw, first draw the circle E M O, twelve inches in diameter, the same as the saw, then lay off on the radius E K, E F, equal to A B, and draw the line at right angles for the surface of the table. With F for a center, draw the circle T H V, equal in diameter to C D. Now the line passing through M, and touching the circle at T, will make the required angle with the line M I. From the point M, lay off at right angles to S M, M L, equal to D N; set the saw gauge at this point, with the angle already found, and the saw bench is ready for the work. The teeth of the saw, for this purpose, should be very coarse, and filed so as to cut the whole length of their sides as well as their points. If three or more of the teeth could be made shorter than the rest, and at the same time be given more set, it would improve its working qualities greatly. When the saw is fastened to the arbor by means of two wedge-shaped collars, we shall have what is called a "wobble" saw. This will cut a groove having parallel sides, but the bottom will be concave in

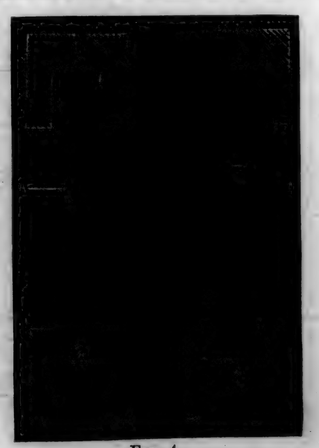

Fig. 4.

sections, as shown by No. 1, Fig. 4. This can be made to give us a groove having its sides straight, by simply jointing the saw, while in motion, with a file and a piece of emery. The work finished in this manner is shown by No. 2. By setting the saw off from the center, one corner of the groove will be deeper than the other, but the sides will still be parallel, and if the work be inclined, a dove-tail groove is produced, after passing over the saw the second time, end for end, as shown by No. 3. H R K G is the point taken by the saw in the first place, and H R I in the second. In this manner work can be easily fitted, like that shown in section by No. 4.

To enable us to use saws of all sizes, and cutters of every description, the saw bench should have a piece inlaid in the table where the saw comes through, and several pieces all fitted and ready whenever they are wanted. Fig. 5 shows just what I mean. In filing a saw for splitting, or sometimes called slitting purposes, I file the teeth as square across as possible, without taking it from the saw arbor, by standing at the front end of the bench. After setting the points a little, just slick up the corners with an oil stone, by resting it on the face of the saw, near the roots of the teeth, and bring the side in contact with the points; in this way the saw can be made to cut nice and smooth, and keep up to its work in all kinds of lumber. It is a good plan to have a good assortment of saws on hand—yes, all we can find. Old ones are just as good as new for many purposes, and if they here and need straightening, why straighten them. There is no one but can tell us how to do it, and if we never try we shall never learn.—Frank Clark, *in Cotton, Wool and Iron* (Boston).

Lumber in Mexico.—A New Departure.

The valuable timber resources of Mexico bid fair to see a merited development under the encouragement offered by the government. "Hitherto," says the Mexican Financier, "these have been almost entirely neglected, and Mexico has suffered the anomaly of drawing large supplies of lumber from American markets. Freights at sea and the cost of inland transportation have, of course, so increased the price of this lumber as to have prohibited its general use in the country. Experience has taught Mexico the importance of developing her own great resources of lumber supply. Hence, there is already an active movement to secure the rich timber lands of the Republic, either by government grants or by private purchase. In Sonora, Chihauhau, Conhuila, Durango, Sinama, Michoucan, Jalisco, Mexico, Hidalgo, and Vera Cruz there are vast quantities of fine wooda largely consumed in American markets, and the coast districts are covered with virgin forests of cedar, ebony, mahogany, and other rich woods, while in all the greater altitudes hickory and hard cedar, and pine, and larch, and oak, and sycamore and walnut flourish to perfection. The rapid advance of railroads is making these supplies more available, and for the encouragement of this industry the various State governments, as well as the general government, are offering liberal concessions to all who will utilize and further develop these great lumber resources of the land."

When it is not convenient to take locks apart in the event of keys being lost, stolen, or missing, and it is desired to fit a new key, take a lighted match or candle and smoke the new key in the flame, introduce it carefully into the keyhole, press it firmly against the opposing wards of the lock, withdraw it, and the indentations in the smoked part of the key will show exactly where to file.

A paper read before the San Francisco Chapter American Institute of Architects, on Friday evening, March 2, 1883, by P. H. Jackson, Esq.

Condemning the Use of Long Girders in one piece extending over two openings.

The subject of my remarks will be on a long cast-iron box girder, or lintel, extending over a length of two openings of Senator Fair's old building on Pine street, which, on uncovering, was found to be broken. Also on the general insecurity of long girders in buildings, when extending over two openings, be the material cast-iron, wrought-iron, or wood; and their further use should be discontinued when so applied. This girder, with another of the same dimensions, had been in the building for several years, supporting the wall on them; and the length of time it had been broken is not known, as its condition was only revealed on being uncovered. (Fig. 1.) It was 17 inches on the

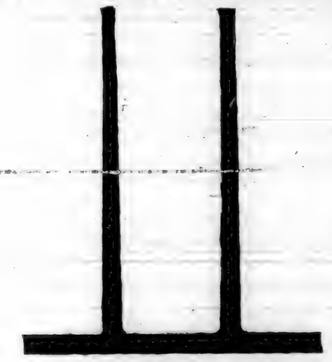

FIG 1.

bottom, by 1½ inches thick, making an area of 25½ inches, had two sides or flanges, as shown in diagram, each 19 inches up from bottom, the two top edges, each ¾ inch thick. See Fig. 1, page 49.

While the sectional area of the bottom flange subject to extension was 25½ inches, the area of the two top flanges subject to compression 1 inch down, equaled but 1½ inches ($2 \times \frac{3}{4} \times 1 = 1\frac{1}{2}$ inches), therefore the area of the bottom to that of the top was as 17 is to 1; while they should be so proportioned as to be duly balanced in resisting areas, when about to undergo rupture, in the ratio of 6⅛ to 1. For this reason, the top of the vertical rib should have had a compressive resistance in metal to meet that of the bottom of about 4 inches, in place of 1½ inches. Also, the resistance for the long length of girder on the top was insufficient to prevent lateral deflection. Therefore the metal in the bottom flange was in excess of the proportion named, and was so much waste of material, as the strength

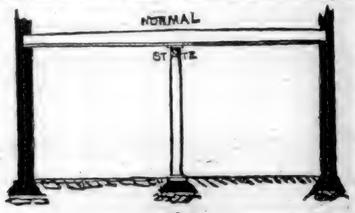

FIG. 2.

of any structure is that of its weakest part. I prefer that the top part in a cast-iron girder, subject to compression when employed for long lengths, should have even a greater amount of metal than usual, and be in the proportion of 1 to 5 instead of 1 to 6⅛. This girder was 34 feet long, and its end supports were the brick side walls—which extended upward. (Fig. 2.) The distance between these end supports was 32 feet 3 inches, and it had as an intermediate support a 14-inch-diameter round iron column.

I would give an approximate breaking weight of this girder, but its proportions are such, and the manner in which it was supported, renders it impossible by any formula. The unbroken girder, when released of its load, as Mr. Eisen, the architect of the Mission Street building where the uninjured girder and other iron work was afterward used informed me, raised off of the iron column one inch, evidencing that the the iron column had sunk that much more than the brick piers or walls on which the ends rested. Upon the hypothesis that this broken girder was similarly situated as the uninjured one, that is, that the column settled more than the brick wall on which the ends rested (which is just as likely not to be so), what were the strains and forces exerted? This will go to show the condition of all girders, when employed, be they wood, cast, or wrought iron, when made in long lengths in one piece, covering two spans, that is, having an intermediate support midway the ends.

The load on the girder caused its deflection, and the column foundation settled, as there can be no diminution in the length of the iron column, which is not the case with the end brick supports. (Fig. 3.) The strength of the girder to resist the load upon it was over its whole length, that is, the distance between the end supports with the assistance of the iron column, whatever that may have been in its resisting settlement.

When this girder broke, the old wall on it being in bond and solid as one piece of stone, most likely rested at points midway between the ends, and not following down the total deflection of the girder, thereby so relieving the load on the girder by its peculiar position, that it was not half as trying to it as it was before the girder broke; also it broke about over the column, and

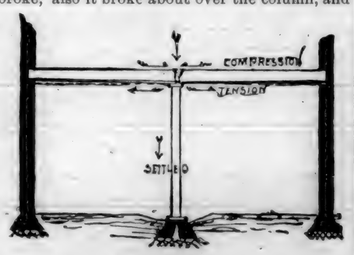

FIG. 3.

rested on it. Thereby making the girder in its broken state better able to sustain the load than before rupture took place. In my annual report to the Superintendent of buildings in New York city, on the 2nd of January, 1872, mention is made of a similar case. I will give the words of the report as follows: On the 24th of November preceding, my attention was directed to two buildings on First Avenue, between 40th and 41st streets, which had iron lintels supporting the brick front above them. These lintels were each in one piece, extending the entire width of the building, but intermediate supports were placed beneath, making the largest openings just under the length for the test as required by law. These were placed in the building previous to my connection with the department. Both of these lintels broke, one near the middle, and the other on one side, and in both the openings having the greatest span. On investigation it was found by their great length, and the unequal distribution of metal, they did not bear properly on the intermediate supports, but curved upward nearly one inch.

This is a similar case to the one in hand. In each case, when relieved of the load, taking the uninjured one as an example for the broken one, it raised up one inch from the top of the column. In the New York case, I remember well that the iron lintels were curved up in the casting, caused by the unequal distribution of the metal. The speculator who was erecting the buildings, finding they curved upward, filled in the inch space between the lintel and the head of the support with slate and cement, and when the load came on it, the lintel crushed them out; as we do not

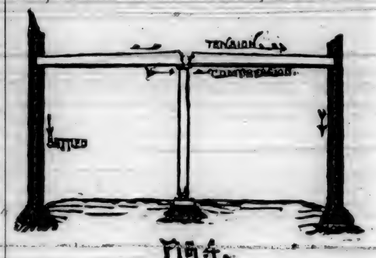

FIG. 4.

have such shoddy contractors in California such could not have been the case here. (Fig. 4.)

Suppose we take that the column remained firm, free from settlement, but the green mortar or cement of the brick piers or wall that supported the ends of the girder pressed out between the bricks, which is invariably the case in every green wall in the lower part when heavily loaded with the work above, and supporting the ends of the girders, and that the foundations for the walls settled. I measured a brick wall as it was being laid up on California street, and when it got to a height of about 17 feet, I made a level pencil line on it and on a board fence at its side, and after the wall was finished in its height, I found that the line on the green wall was ⅜ of an inch below that on the fence. The settlement of the green brick-work supporting the ends of the girder would reverse the forces and strains on the girder to that of previous mention. That is, the column, being the highest in the center, would be the fulcrum, and the girder the lever, and with not only the load on top of the girder, but we have the weight of the brick walls on each end above the girder support to break it. It is reversing the intention of the original supporting ends, they become loads instead of supports; consequently the point of fracture would be at the fulcrum column, and the girder would accommodate itself to the situation if it should break directly in the middle, as it should have been originally made.

The top of this girder, in this case presenting but an area of 1½ inches, would have to resist tension, and the bottom resist compression—just the reverse of what the girder was intended to do. The resistance to tension of cast-iron is usually computed at but 15,000 pounds to the square inch, and 1½ inches area, the part presented to resist this force, would equal but 22,500 pounds. So this practice of making long girders spanning two openings, which has been so much in vogue in San Francisco, should be discontinued. The advantage gained by the neutralizing of forces on each side of the central support is but small compensation to meet the danger in the practice. Architects have remarked to me that these double spanned girders are more to be relied on in case of earthquake oscillations or upheavals. The same reasons apply in settling of the end walls,

or the settling of the intermediate support, or the raising of either of them in an earthquake disturbance, as in the case of the broken girder. The using of cast-iron girders of long span to support heavy loads, when tensilely employed, should be condemned.

I will here quote from one of Professor Fairburn's works on the use of cast-iron beams and girders, in a case where the beams in a cotton factory broke in Oldham, England, in 1844—in which there were upwards of 20 persons buried in the ruins.

Nothwithstanding the increased security that has been gained in the form of cast-iron beams and girders, their use is nevertheless attended with danger, when either the design or construction is left to ignorant persons, and the numerous and fatal accidents which have occurred at various times, which have very naturally created in the public mind serious apprehensions of their security, and which have very naturally been traced to this cause.

In order to insure safety and attain success in their making, the following qualifications are necessary:

First, a knowledge of the properties and application of the material, when subject to three distinct strains, namely, torsion, compression, and tension, or separation or tearing the parts asunder.

Secondly, an exact knowledge of the proportion of the parts of a beam or girder so as to have the forces of extension and compression balanced when about to undergo rupture from transverse strain.

Thirdly, a knowledge of the laws which gives the expansion and contraction of metals, in order to insure sound castings and an equal degree of tension during the process of casting.

Many hold the impression because a girder beam or column, or any other support in a building or other structure, fills its *present* mission in sustaining function, it is safe for the future. We have in this case as an evidence what time does; but I do not refer to the application in this case particularly, as this was subject to vicissitudes in the manner in which it was held; but I refer to its general capacity to maintain the load for all time when employed beyond the measure of its elastic force. This distinctive point is, that the safe load should not exceed ½ of the breaking load. The strain just sufficient to balance the elasticity of common wrought-iron is computed to be 25 gross tons, or 56,000 pounds, while the measure of the elastic force of the material is computed to be 10 gross tons. Therefore, the ratio of the elastic force of the material is as 1 is to 2½, but this point of strain does not maintain recuperation when relieved of the load. With the human body, when the muscles are strained beyond the point of their elasticity, it is disabled for further use, until Dame Nature, in the fertility of her goodness, resuscitates through rest and care the disabled part in further renewed muscular development. So with us in our mechanical constructions: do not be blind that from present appearances of strength in our constructions it is indicative that it will remain so in the future, as all materials have standards of strength and possess elasticity to a greater or less degree.

I would like, before concluding, to refer to an impression that some have: if a girder is made of wrought-iron, it is much safer than made of other materials; this is not so: all materials used for supports have certain sustaining powers, and keep within the scope when employed of their elastic forces compressively and tensively under all circumstances; and all materials not subject to decay or deterioration, from excesses of temperature, will fulfill their functions, even be it of glass. A wrought-iron girder, loaded beyond the measure of its elastic force, is just as unsafe as if of other material, as there is an insidious distruction awaiting time for its complete ruin. In this I referred to the tensile resistance of common wrought-iron at 25 tons, or 56,000 pounds. In my printed article on the utilization of forces, or using cast-iron compressively, I mention the tensile limit of average wrought-iron at 60,000 pounds. It is a mistake which I desire to correct, as the rate of 60,000 pounds means refined iron—superior to the ordinary common iron—the difference being but slight in the two estimates, but I desired the correction made in the discrepancy.

Rights of Gas Companies.

A rather important case has been decided in Chicago, which concerns architects and builders perhaps as much as the parties directly involved. It seems that some years ago a house stood on a certain lot in that city, supplied with gas from a service-pipe from the main in the street. The house was pulled down, to make room for the erection of another on the same site, and the old service-pipe was capped, and left projecting slightly through the wall, another service-pipe being put in to supply the new house. By the arrangement of the new house a coal-bin was planned at the point were the old service-pipe came through the wall, and while the bin was being filled not long ago, a lump of coal struck the stump of the pipe and broke it off, allowing a great quantity of gas to escape into the cellar, where it exploded, severely injuring the mistress of the house, who brought an action for damages against the gas company. The company defended itself on the ground that all service-pipes belonged to its customers, instead of itself, and that its customers were alone accountable for injury to their property. This was the real point of the trial, the question as to the actual author of the injury not being called up at all. The suit was brought for fifty thousand dollars, as damages, and the jury awarded nine thousand, being apparently satisfied that the responsibility for the service-pipes lay in the company. It is so common to see, particularly in city buildings, the ends of abandoned gas and water pipes projecting through the cellar-walls, where they are liable to be broken at any time by settlements or accident, that the question of responsibility for their care, and for damage which may result from any injury to them, is a matter of considerable importance.—*American Architect.*

Builders' and Manufacturers' Mutual Aid Association.

We would call particular attention to the advertisement of this association in this issue. Although this association is young, it presents the same advantages possessed by its older competitors, without disadvantage to either. The objects of this association are to bring about a better acquaintance among the members of the building, manufacturing, and other trades, and the maintenance of such plans as shall tend to the mutual benefit and protection of its several members or their families; its prominent object is to pay a fund to the family or other legal representatives of its deceased members. This is done by an assessment upon each incoming member of two dollars per one thousand dollars, full benefit, and the same sum at each subsequent death, which provides a fund in the treasury which, upon satisfactory proof of death, will be paid to the legal representatives of the deceased member.

Full particulars in regard to any matters connected with this association will be given by the agent, whose office can be found (as per advertisement) at Room 11, 240 Montgomery St.

SCIENCE OF CARPENTRY MADE EASY

We will send the above work in connection with the California Architect and Building News for one year, upon receipt of $5.50.

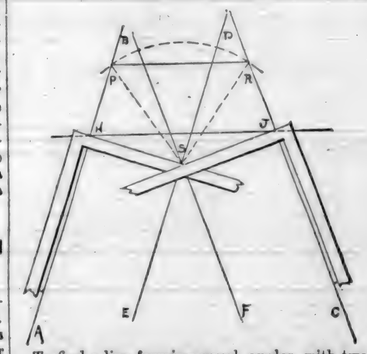
WHEELING, W. Va., February 17th, 1883.

To the Editor:

In using the word "stumpage," in referring to prices paid for timber lands, do you mean so much per thousand feet for the lumber taken off? or what is the true meaning, as understood by lumbermen? Please explain and oblige,

TWO DISPUTANTS.

The word "stumpage" is used by lumbermen to indicate standing timber. In quoting a sale of timber lands, at say "$2 per thousand stumpage," the meaning intended to be conveyed is that the purchaser pays that much upon an agreed estimate of the amount of timber standing upon the tract, the land being included in the transaction. If the actual cutting overruns the estimate, as is usually the case, the buyer is, of course, the gainer to that extent. The term stumpage may also be applied to a sale of standing timber, where the land is not included, in which it would mean the actual amount of timber cut off, log scale. The word is laid down in the latest edition of Webster as a Maine localism.—*Northwestern Lumberman.*



To find a line forming equal angles with two converging lines, A B and C D: draw E D and B F parallel, and equally distant from A B and C D, intersecting each other at the point S; from the point S as center, describe an arc, cutting the converging lines at the points P and R, which joined gives the line required.

The same can be found by the use of the square. Place, as shown, the square on the lines A B and C D; mark from the point of intersection S, cutting the lines A B and C D at the points H and J, which joined gives the line required.

L. D. GOULD.

British architects appear to concede that plumbing and other sanitary arrangements of American houses are far better than those of the English.

Practical Draughting.

The lessons in draughting given in this work are written in such a way that they will be understood by apprentices and workmen. They embrace a series of practical instructions for machinists, mechanics, apprentices, and students at engineering establishments and technical institutes. Price, $1.00.

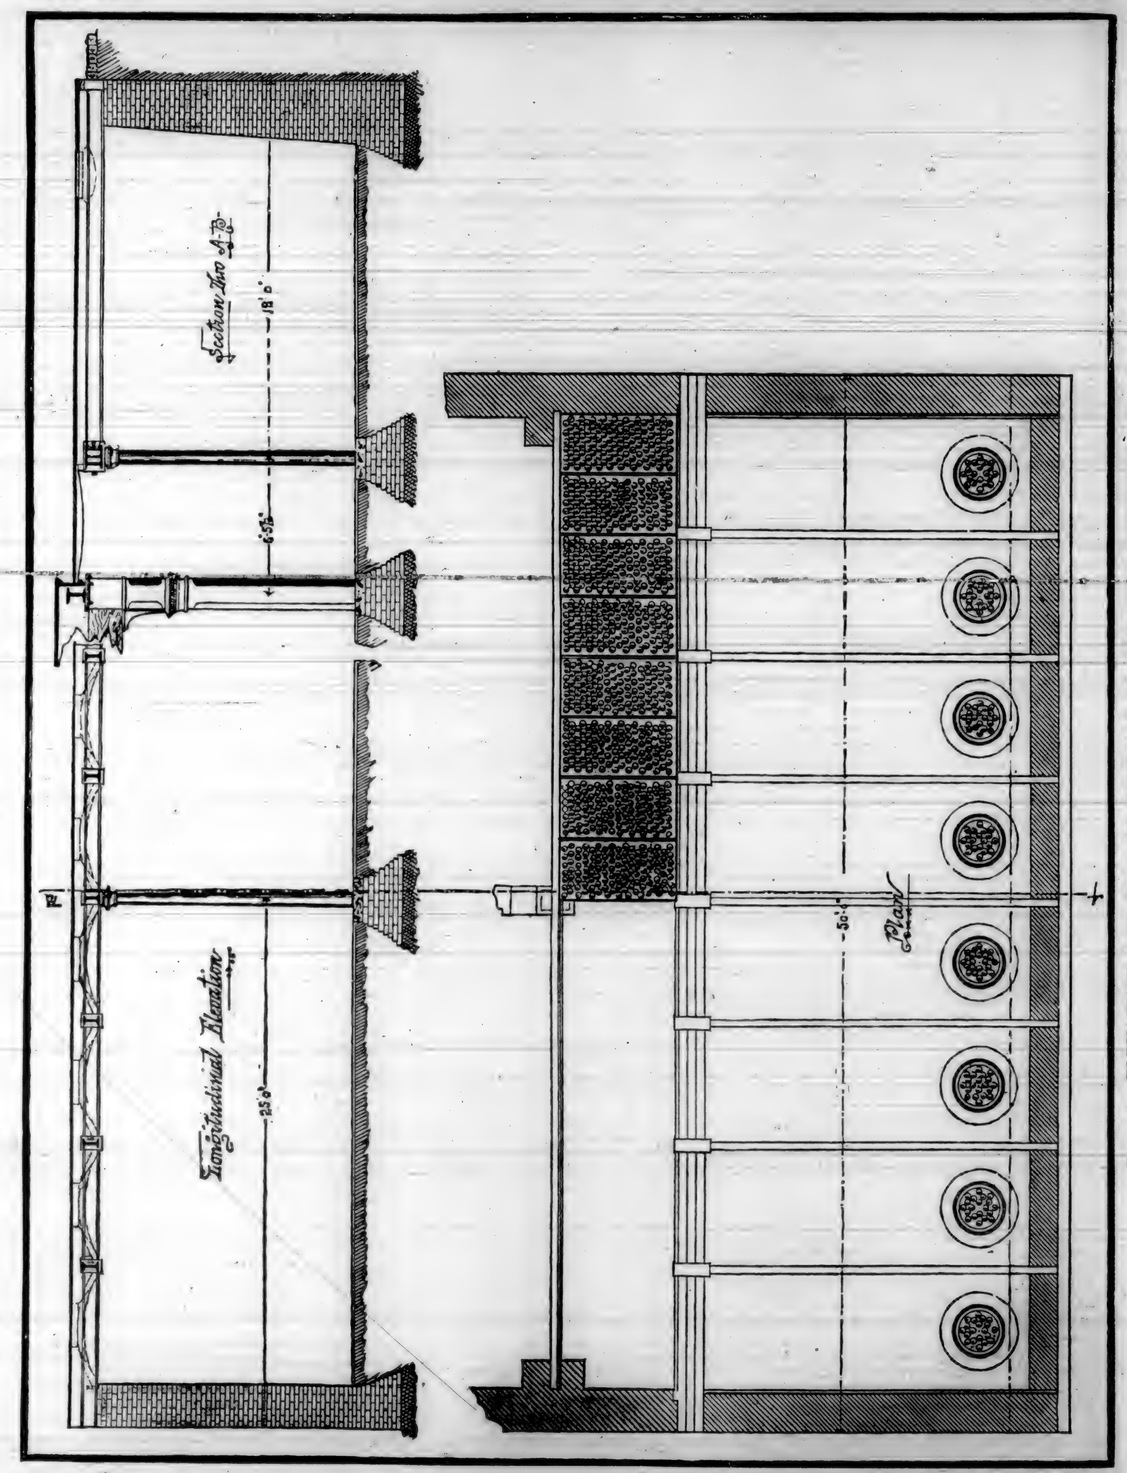


PLATE 1.—ELEVATIONS AND PLAN OF SIDEWALK OF BASEMENT EXTENSION. (See Page 50.)

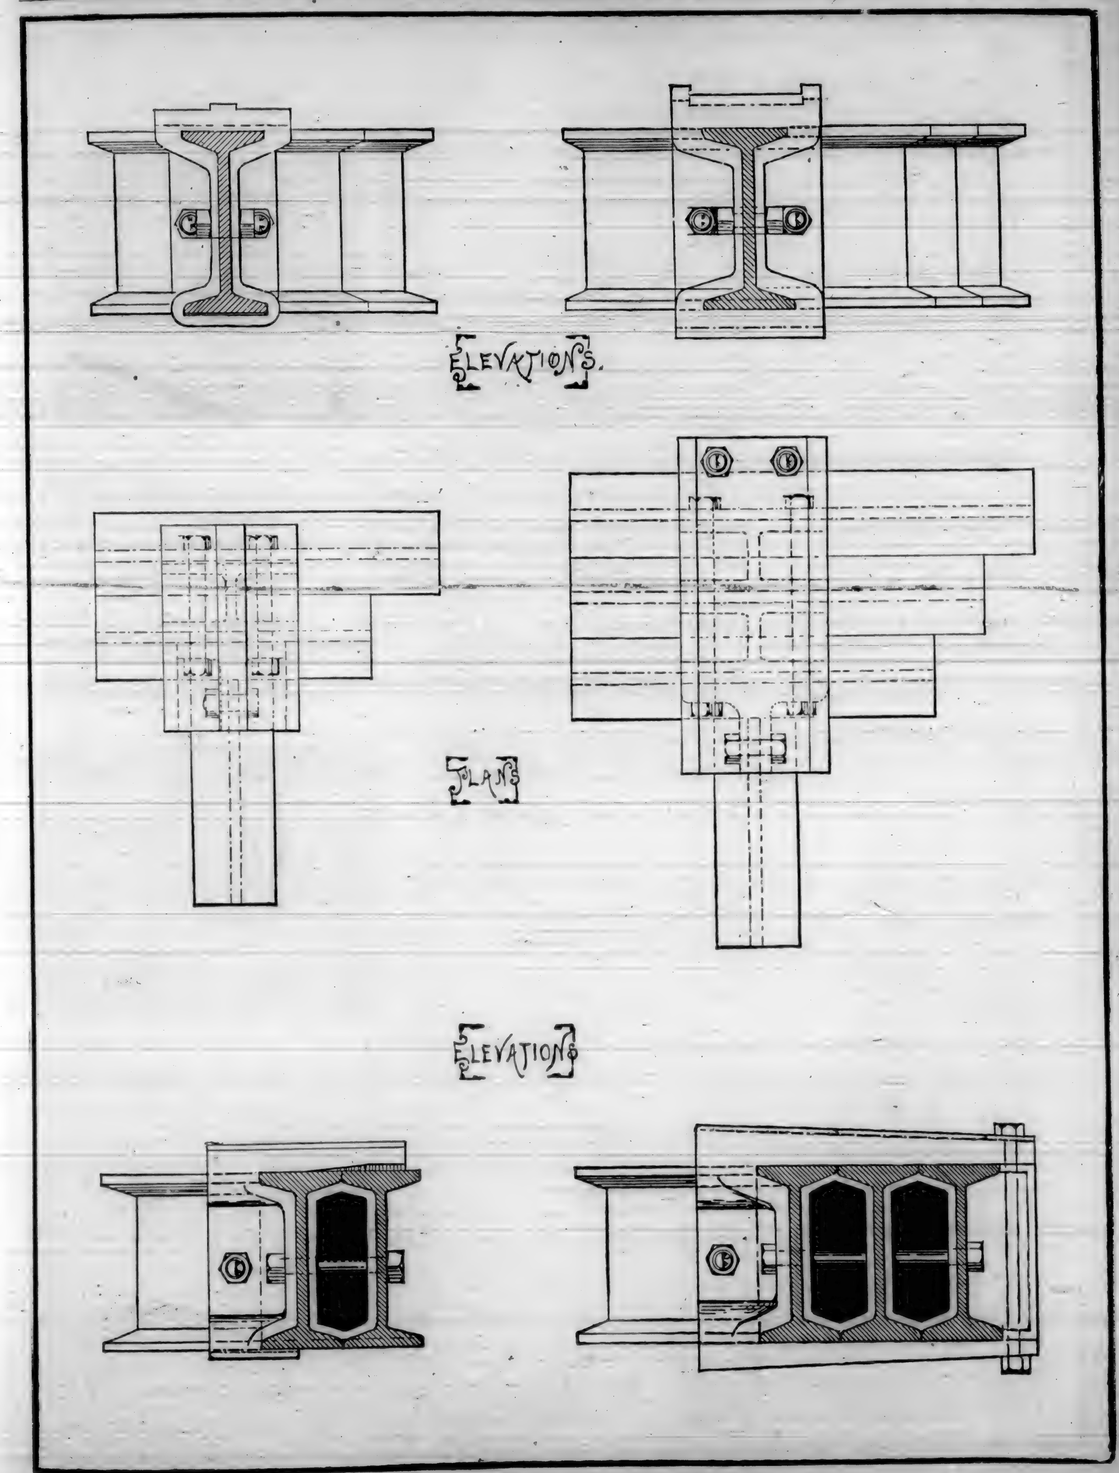

PLATE 2.—CONSTRUCTION OF GIRDERS. (See Page 50.)

Improved Building Construction.

BY THE ABSENCE OF THE USUAL ENCUMBERING PIERS AND COLUMNS IN THE BASEMENT AND FIRST STORY, AND A BETTER MEANS FOR LIGHTING TOWARDS THE REAR FROM THE FRONT OF THOSE APARTMENTS.

Plate 1, page 48, shows the longitudinal and sectional elevation of basement extension, also plan of sidewalk, beams, girders, and illuminating tile of Mr. Somer's new building, Nos. 741 to 745 Market Street, opposite Dupont Street, just finished, and occupied by F. S. Chadbourne, & Co. furniture dealers. W. P. Moore, Esq., architect.

Plate 2, page 49, shows the construction of the girders with vault-beam attached with three beams forming the girder for long lengths, and two beams forming girder for short lengths. The building extends back to the next street, is fifty feet front, and five stories in height including basement, which latter extends out under the sidewalk over twenty feet from the face of the building, making the basement and basement extension a continuous room without the usual obstructing piers and columns in basement and first story. The front has but a single central support of great strength in each basement and first story, with large show windows on the main floor, and the means for transmitting light received from the front to the rear of basement and first story of these deep buildings is a great desideratum, particularly for large retail stores. Besides, the cost is no greater, if as much, as in the usual obstructive construction which takes up valuable room, and divides the basement from the basement extension under the sidewalk. The only obstruction in this large basement room, which is the entire width of the building, is but a 11-inch face by 17-inch deep iron post, which supports one of like size above on the main floor, which in turn supports one end of each of two Franklin girders on a line of second story, each 25 feet long, spanning the 50 feet front. There is also in basement a thick 7-inch round iron column shown, that supports the ends of the two novel-constructed girders, each composed of three 10½-inch rolled wrought-iron beams, 25 feet long, making 50 feet for length of girder, with but one 7-inch diameter support. The iron cap-plate of this 7-inch column fits in the head of the column on the under-side, and on the top has two flanges on the outside, which project up on the outside of the girders, and hold them in place. In basement, the iron girder was not used, the inside ends of the vault beams would have to rest as usual on the ordinary brick piers, and would render the obstruction mentioned. In places of this kind, iron girders have been used composed of either one deep beam with several supporting columns close together, and in other places two beams form the girder, with cast-iron diaphragms between and bolted together, and with the vault-beams, resting on one side of the outside beam nearest the curb, and secured to it by wrought knee pieces; but in such a case the inside beam of girder cannot be employed to more than one-half its capacity to resist the load that rests on the side of the outside one, and transmitted indirectly by the inside diaphragm and bolts.

The strain upon both is sideways; and indirectly so, with the one away from the end of the abutting vault-beam, whose inclination is is to turn over toward the curb. The end of the vault-beam end at its bottom rests on an inclined plane, the lower flange of that part of the girder, hence the tendency of it is to slip off out toward the street, being held insecurely by the knees to the girder, the inclination is to turn over that way, hence, any calculation made as to the resistance of the two beams forming the girder to sustain the load on the side, by the formula which is computed as being loaded on the top, unless a large deduction was made for safety, would be deficient in proper result. The reason why these girders have sustained the loads is because the sidewalks have not as yet been loaded to what it is usually computed they should be. With the girder composed of three 10½-inch rolled beams, as shown and used in Mr. Somer's building, which construction is the, and not their, invention and held by P. H. Jackson & Co., Nos. 2 California and 231 First Streets, this city. The load of the end of the vault-beams on the outside is precisely as if they laid on top of the three beams composing the girder, and their weight diffused over the top, as the formula compute they should be.

The wide tongue which extends over the top of the three beams is as if integral of the vault-beam, and may be considered as a solid part of it as if rolled with the other part of the beam; or in other words, as if the vault-beam was cut away in every part but the top flange, and that extended over the top of the three beams forming the girder, and made stronger in that part to resist the load than in any other, by which means the girder is properly loaded in the manner calculated by our formulæ for beams, and not on the side, as in that of the single-beam girder, with the inclined slip off vault-beam, or the two beams tending to a circuit. The description is as follows: There are two cast-iron diaphragms which fill up the space between the three beams forming the girder, and the stress upon these diaphragms is compression, and as cast-iron's resistance to compression is 93,000 pounds to the square inch, these are held together by heavy bolts and nuts which pass first through the shoe of the connection that receives the end of the abutting vault-beam, then through the three webs of beams, and through the two diaphragms; they are to each other held in the most secure manner, as far as *internal* connections will make them.

On the outside on top is a heavy wide supporting tongue, which acts the part of the top flange of the vault-beam, extending over, as before explained. This is the great supporting power for each individual vault-beam, the lower tongue being but an assistant to it through the means of the bolts as shown, transmitting aid from the bottom to the top where three or four beams form the girder, but where two beams are the girder the lower tongue is dispensed with.

What are the forces and strains exerted on this patent connection by which any number of beams required for service may form a unit for strength to resist a side load on one of them, but transmitted as a load on top of all of them? The ends of the vault-beams are most securely held to the shoes. The top tongue is as a beam fastened at one end at the root where broken

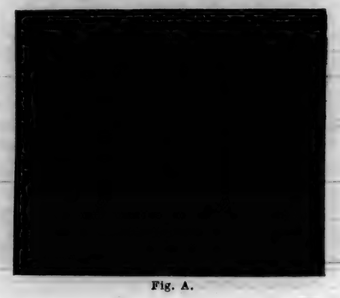

Fig. A.

off and lifted up at the other where the bolts are (see Fig. A), and the computation is to be made as to its resistance, providing the area of the bottom subject to extension in cross section is in the ratio of 6½ to 1 of the area of top subject to compression as in that of Hodgkinson's formula for beams fastened at one end and loaded at the other. (See Fig. B.)

The bottom tongue is more favorably exerted than the top one, while the force exerted on the top tongue is greatest at the root where it joins the shoe, the bottom one acts at its outer end on the bottom

Fig. B.

flange of the beam at *c*, which is the fulcrum, and the strain is mainly exerted between that and the bolts, which are immediately against *c*. This is the place where the strain mainly hinges. The strain to separate this tongue at its root by means of the long lever from there to the fulcrum *c*, and from there exerted on the adjoining resisting bolts, is comparatively light. Hence this bottom tongue is much stronger with the same quantity of metal than the top one. This construction of uniting beams forming girders when loaded on the side, equalizing the load as on the top, cannot on close investigation but commend itself to favor.

The public are respectfully invited to examine this light, airy and substantial building, so well adapted for a large retail business, where the large show windows permit such a fine display of goods on sale.

Terra Cotta Lumber.

One of the most interesting and useful inventions made within the past few years is the process of making terra cotta lumber. The making of fire-hardened clay materials, whether brick, tile, or vessels of any kind, carries us back to the dawn of history. While clay beds are to be found in vast quantities in almost all countries, the utilization of the material so lavishly bestowed by nature has been for the most part limited to brick and pottery. It is only recently that the idea has been suggested that a material might be produced from clay which would lack the brittleness of the articles so long known, and possess the exceptional and highly valuable quality of admitting of being cut and "dressed" into irregular shapes with edged tools.

Before our time anything constructed of clay had to be given its finished form while soft, and before the material had "set." Now we can make the material in large blocks, and afterward cut and shape it as we can lumber. This peculiarity, which is so valuable, is due to the same character of internal structure which wood possesses—that is, porousness. In proportion as wood is porous, within limits, of course, it is most useful for the vast varieties of building purposes to which it is applied. And so by making terra cotta porous we bring it more within the category of wood substances, and then properly name it "*terra cotta lumber.*"

It has similarities and dissimilarities of the utmost importance in contrast with wood and clay materials, and they seem to supplement each other. In other words, terra cotta lumber occupies an intermediate position between brick-like substances and lumber. It is, for instance, brittle and not fibrous; it lacks strength to resist the transverse strain which is possessed by wood, quantity for quantity; but it presents greater resistance to superimposed weight. It is fireproof, while wood is not, and it can be "dressed" by the plane and saw, which, generally speaking, clayey substances cannot be. In addition, it will receive and retain on its surface plastering or other surfacing without the application of lath. It must be borne in mind that, being at once an earthy substance, and of open or porous structure, it possesses all the qualities which appertain to those two characteristics in all substances; and it possesses the advantages not belonging to substances not having these both.

As an article of commerce and use it may be produced easily, the clay being found at hand in almost any part of the country. Hence its cheapness; hence its universal utility. Compared with other commodities it may be called home-made, like those articles of universal use produced in the farm houses everywhere. It may be applied to domestic purposes on a small scale, or to the largest public structures. Its uses, indeed, require no enumeration—they suggest themselves readily to the mind. Thus, invention in the useful arts is steadily bringing into utility the products of nature, which otherwise would lie like worthless material on the surface of the earth. If clay were valuable only for brick, piping, etc., but a small fraction of the clay would be utilized; but with this process a very large percentage of it becomes immediately useful. In this material, what New Jersey alone produces may be taken as an example.

The belt of country underlaid by these clays extends entirely across the State, and, as described by Prof. Cook, the State geologist, includes an area of 320 square miles; while the area within which these deposits have been worked up to the present time is only 68 square miles, the actual openings of the clay beds being only a fraction of this last area, so that, notwithstanding the hundreds of thousands of tons that are annually produced, the industry itself may still be regarded as in its infancy. The average depth of these clay deposits is about 400 feet, and their order of superposition is shown in the following table:

		Feet.
1.	Dark colered clay (with beds and laminæ of lignite)	50
2.	Sandy clay, with sand in alternate layers	40
3.	Stoneware clay bed	30
4.	Sand and sandy clay (with lignite)	50
5.	South Amboy fire clay bed	20
6.	Sandy clay, generally red or yellow	3
7.	Sand and kaolin	10
8.	Feldspar bed	5
9.	Micaceous sand bed	20
10.	Laminated clay and sand	30
11.	Pipe clay (top white)	10
12.	Sand clay, including leaf bed	5
13.	Woodbridge fire clay	20
14.	Fire sand bed	15
15.	Raritan clay beds: Fire clay	15
	Sandy clay	4
	Potter's clay	20

These clays form one of the most important elements of material wealth that the State possesses. Several hundred thousand tons of fire clay are dug annually and sent into maket for making fire-brick, fine pottery, sewer pipe, terra cotta ware, retorts, and crucibles, facing for wall paper, etc. The average price per ton is about $4, and the aggregate production of fire clay alone in its crude state exceeds $1,000,000. The stoneware clay from Perth Amboy is shipped to all parts of the United States, and supplies the material for most of the stoneware that is used in the country. Fine earthenware was formerly imported almost wholly from Europe, but within the last few years extensive potteries have been established at Trenton, which have been remarkably successful in the qualities of the wares made, and in finding a ready market for them. The Trenton potteries employ several thousand men, women, and boys, and produce several million dollars' worth of ware annually. Although the principal ware made is of the common white earthen and iron stone, the quality of which is fully equal to the best English ware of those grades, these works at Trenton also produce a much higher grade of decorated ware, that bids fair to supersede that which is now imported of this kind. The manufacture of pottery is rapidly increasing in quality and extent. The great abundance of the clay, its superior qualities, and its convenience to market have made it almost essential to the successful prosecution of some of the great industries of the country.

The terra cotta lumber is rendered porous by the simple device of mixing in resinous sawdust with the wet clay, and when the clay has dried burning out the saw dust, thus leaving interstices in the brick-like material. The fine clay, free from vitreous ingredients, is taken from the bed thoroughly mixed by means of small quantities of water with any desirable quantity of resinous sawdust, increased in proportion as it is desirable to make the product more porous. At Perth Amboy, where the works of the New York Terra Cotta Lumber Company are located, there are eight of these mixing mills in use, run by steam.

After a thorough mixing has been accomplished, the workmen shovel the mixture out of the mills and into a traveling trough, constructed of a wide leather belt and side walls, to the belt elevator, by means of which it is carried to the third floor. Here it is shoveled into a compressor, also worked by steam, through which it passes to the floor below, and is forced through a die into any requisite shape. Here, usually in the shape of large slabs, it is left to air dry. After partially drying here, it is carried to the first floor, and then dried on a brick flooring heated by flues running underneath it from grates. Here in a short period it is thoroughly dried and hardened.

It now goes, in the form of slabs, to the ovens, six in number, where it is piled up in layers, and, after all openings are closed, brought to an intense heat and all the sawdust burned out. This occupies forty-eight hours, and produces in that time about 180 tons of completed fireproof lumber.

It is now planed, tongued, grooved, sawed, etc., into any desirable shape, and this floor almost resembles a saw-mill or carpenter's shop. The dust of the sawing is carried off by means of a steam blower.

In conclusion, we may enumerate some uses to which it may be applied. It is light, bulk for bulk, and may be united like joiner work or nailed into place like so much wood. In the waterworks of the Holly system it has been used and pronounced admirable for filters. Saturated with petroleum, it becomes a valuable fire lighter or kindling wood, which may be used indefinitely. When immersed in boiling asphalt for a few moments, sufficient bituminous matter is absorbed to resist the action of water, for the asphalt becomes part and parcel of the material itself, and does not flake off when exposed to cold or dampness, as with common brick, solid terra cotta, or iron.

This fact and the splendid insulating qualities both of the material and the asphalt are now attracting the attention of electricians, and give reasonable hope that one of the problems of underground telegraphy has at last been solved.

The many future uses to which it may be put can be conjectured from the number of applications for patents being now made by Mr. Gilman, the inventor, for special purposes, to wit: Filters, underground electrical insulation, steam boiler and pipe sheathing, fire lighters, imperishable ground sills, waterproof brick, grain and elevator bins, refrigerators, safe and vault linings, fireproof jackets for iron columns, furnace linings, safety warehouses, etc.

Not the least noteworthy characteristic of this material is the fact that there is no waste in its manufacture, for the reason that all the remnants and edgings made by sawing, etc., find a market.—*Scientific American.*

The Art Amateur for March contains admirable full-sized working designs of clover, azaleas, and water-lilies for china painters; a South Kensington chair seat, and a chalice veil for embroiderers; a score of delicious cupids, and a page of fresh and excellent monograms, twenty-six in number, giving the letter A in successive combinations with the entire alphabet. The remaining letters are to be similarly given in future numbers. The leading article in this issue is a capital notice of the Water-Color Exhibition, by Edward Strahan, with illustrations of over thirty of the noteworthy pictures. Boughton's beautiful bainting, "Snow in Spring," is finely reproduced, and there is a good portrait of Doré, with some well-chosen examples of his work. Flower painters, fan painters, china painters, and photograph portraitists are remembered in the practical articles, and there is much pleasant and copiously illustrated talk about French furniture, Japanese art, new houses, old fashions, and a variety of other art topics. On the whole, the March number is an excellent specimen of this always attractive magazine. Price, 35 cents. $4 a year. Montague Marks, publisher, 23 Union Square, New York.

In 1851 the first saw-mill was built on Puget Sound, which was soon followed by others, until to-day there are 15 mills at work on the Sound. The largest mills cut 200,000 feet per day. It is calculated that since the first mill was built there 2,500,000,000 feet of lumber have been cut, principally fir, pine, oak and cedar.

Village Builder and Supplement.

Contains plans for cottages, villas, suburban residences, farm houses, stables, carriage houses, store fronts, schoolhouses, etc.; also exterior and interior details for public and private buildings, with approved forms of contracts and specifications. This is an original work comprising the designs of fifteen leading architects of the Eastern States. Price, $10.00.

Wheeler's Patent Wood Filler.

This celebrated Eastern preparation is now being introduced on this coast. For giving a natural and perfect finish to hard wood, it is unequaled.

Breinig's Patent Lithogen Primer.

The best and cheapest results are obtained by the use of this Primer. It does its work perfectly; less paint is required than upon any other size or priming.

Breinig's Lithogen Silicate Paste Paint.

These paints are guaranteed to stand the climate of the Pacific coast better than any other preparation. They will last longer than the best white lead. Require only thinning with turpentine or oil, according to the character of the work.

Sample cards of colors and any information furnished as per ad. on page vi.

THE

CALIFORNIA ARCHITECT

—AND—

BUILDING NEWS.

Published on the 15th of each month

BY THE

San Francisco Architectural Publishing Co.

JAMES E. WOLFE, {Editors & Managers} GEO. H. WOLFE.

Rooms 11, 12, 13, No. 240 Montgomery Street.

Terms in Advance, $2.00 Per Annum.

ENTERED AT POST-OFFICE AS SECOND-CLASS MATTER.

ADVERTISING RATES.

Front Cover, outside, per square, each insertion	$2.50
Back " " " " "	2.00
Pages preceding and following reading matter, per square, each insertion	1.50
Other inside pages, per square, each insertion	1.00
Full page, inside, one insertion	30.00
Each subsequent insertion	25.00

Advertisements alone inserted that refer to materials used in the construction and furnishing of houses, and to matters and trades belonging to the building interest.

NO OTHERS RECEIVED.

Advertisements inserted for 3 months or less are payable in advance; payable quarterly when inserted for a longer period.

A square is ⅞ of an inch in length by width of the column.

When money is sent for subscriptions, the receipt of a copy of this journal is an acknowledgment that it has been received. Unless requested, we do not send receipts.

Bound Volumes of This Journal.

Bound volumes of 1879, 1880, 1881, and 1882 (in one book) complete, with all ads. and covers removed, will be sent to any address upon receipt of $8.00.

Bound volumes 1879 and 1880, in one.....$2.50
" " 1881 and 1882, each.....$2.50
" " 1880 (only a few left).....$2.00

In 1880 the subscription price of this journal was only $1.50, and we have put the price of bound volumes accordingly.

Volumes of 1882 and the sixteen full sets are all supplied with a full index.

Any one failing to receive a complete index will be supplied by sending a postal card to this office with their address.

Building Activities and Prospects.

In previous issues of this journal during the current year, we have been enabled to present most encouraging and cheering accounts of the building prospects in San Francisco. But as the months roll round we find the increase in number of contracts let, and the amount of money expended in building operations, to be much greater than we anticipated at the commencement of the building season. The unpropitious state of the weather during the period from January 1st up to the commencement of the late rains caused a general feeling of dispondency, and the almost universal opinion prevailed that failure of crops and depression of all kinds of business were sure to follow—the building interest included. But the glorious rains which came with the closing days of March and the opening days of April, dispelled all doubts as to the crop results for 1883, and caused universal rejoicing and gladness throughout the entire State and coast.

The facts stated in another article in this issue illustrates the magnificent results reasonably to be anticipated for the current year; our building intelligence report the first quarter of 1883, exclusive of the report in present issue, being more than three times greater than that of 1882 up to the same period—a contrast which conclusively demonstrates that San Francisco is enjoying a splendid degree of prosperity, not merely in the isolated matter of building improvements, but generally; for it requires general business prosperities to enable or justify expenditures in the erection of buildings, the former always being the outgrowth of the latter.

Comparison of Building Operations.

A GOOD SHOWING ASSURED FOR 1883.

A few weeks ago, and one heard on all sides forbodings of dull times ahead for the balance of this year. Notwithstanding the discouraging rain prospects existing a few weeks ago, we felt confident that the building interest would be very brisk. This result was arrived at by almost weekly comparisons with the same dates in 1882.

We find in the previous year that the sum total of improvements—brick, frame, and alterations—reported for the first 3 months, amounted to

51 BUILDINGS OF THE VALUE OF $306,060.

For the first three months of the present year we find total improvements to be

142 BUILDINGS OF THE VALUE OF $1,013,197.

In the year 1882 we added 10 per cent. of the sum total for buildings that may have been overlooked, and for extras, etc., etc. In the amount given for this year we have added but 5 per cent. This is due to the fact that our force of reporters has been increased, and we feel confident that but few new jobs are started, upon which a call is not made by one of our reportorial staff.

Surely there is something suggestive in the above figures, which proves as correct the thoughts contained in another article in this issue, that "Capital will not remain idle."

This year promises to be one of the best in regard to building operations that this State has been blessed with for at least 10 or 12 years. Mechanics of all kinds are in demand at advanced wages. Prices of all kinds of materials are stiff, with a tendency upward. With a bountiful harvest assured, there can be but one drawback to the general prosperity, and that will be the lack of labor to move our immense grain and fruit crops.

Capital Will Not Remain Idle.

We predict a large increase of building operations this year, from the simple fact stated in the heading of this article. Money is very plentiful and will of necessity be used where it will bring in to its owner some recompense. If the wheat crop is short, and no opportunity for speculation be offered, then capitalists will invest their money in a *sure thing*; and what more favorable project offers than that of buying real estate and erecting suitable buildings for rent?

From careful inquiry we find that *rentable* houses are hard to obtain at present; and with the visit of the Knights a few months hence, there will be such a demand for accommodations that an empty house will be a very rare thing to find. Speculators are already at work trying to get up a corner in rooms.

A prominent capitalist visited our office during the month and inquired particular in reference to the cost of building FLATS. His idea is to buy lots in various parts of the city and erect apartment houses capable of accommodating four separate families. He assured us that two or three well-known gentlemen would cooperate with him in the idea he intends to carry out. His intention was to place part of his money in a flour mill, but thinks there is a much better field for investment in the erection of well built "FLATS." Property at the MISSION has been talked of as the probable location of the houses, wisely so we think, as the cable lines soon to be in operation will cause this beautiful part of our city to be eagerly sought after for comfortable homes.

Meanwhile, we are pleased to note the evident decay of the Pine Street excitement. One thing sure, if this were not so our bonanza kings would not put their millions into real estate. The withdrawal of the money from the Nevada Bank for the purpose of real estate investment is an event well calculated to make property owners all over the city feel confident in the value of their investments, and this confidence is strengthened by the fact, that the result of the bank's investment has been only obtained after a careful review of the market, and with the certain knowledge on the part of the investors that no surer, safer, or profitable way of getting a fair percentage on their money could be thought of than the one they adopted.

Surely it is well said that capital will not remain idle.

Another Proof of Prosperity.

The fact that nearly every architect's office in San Francisco is "full of work," and the entire draughtsmen's forces of the coast is fully employed, with vacancies in many of the offices for good draughtsmen, illustrates a degree of prosperity greater than has been enjoyed for many years. Nor is this confined to San Francisco; our advices from Portland, Oregon, Seattle, Los Angeles, and other points and places on the Pacific Coast, show the same state of facts, and illustrate the pleasing degree of prosperity prevailing throughout the entire western confines of our favored country.

The Gradual Decadence of the So-Called Eastlake Style of Architecture.

This style of Architecture when first introduced into California began at once to attract the attention of a certain class of property owners, who saw in the new style a chance to build fine-appearing and apparently well-constructed houses, erected in many cases to add to the value of their contiguous property.

Many scarcely gave a thought as to the manner of construction of the buildings, their sole aim being to present a showy house. This they accomplished by a liberal plastering on of "gingerbread" work, and by engaging the services of painters who were experts in the mixing of fancy colors. If Charles L. Eastlake could be brought suddenly to face with one of these imitation Chinese-colored houses (named after him), we can well imagine the looks of horror that would overspread his features, as he would gaze on the wooden foundation, painted so as to resemble moss-covered rock; hoods over windows of a chocolate color, relieved by brackets painted with a beautiful coleur de mouse; window sash of a red, the brilliancy of which could only be exceeded by that of pure vermilion; fantastically beautiful dragons with large eyes, and mouths open as if to devour the beauties of the surrounding scene; the upper sash of the windows divided into small squares, so that in case of necessity they can be taken out and used for checker-boards; a few dozen strips of wood, beautifully interlaced for a cornice, giving the birds a nice roosting place for their weary feet, etc.

How grandly kind the nature of the so-called Eastlake architects all over the State must be to thus provide for the wants of every one, birds as well as men! Tears come to the eyes of the beholders as they gaze on the emblems erected on the house-tops to the memory of the great and good demons and dragons who departed this life in the centuries B. C. May their memory ever be as green—as the ideas of some of these E. A.

We are well pleased to note the evident decay of the monstrosity ideas that have been too often of late introduced into the architecture of this coast. Many houses, built, a few years ago according to the ideas then in vogue, are now being changed into a style more in keeping with the climate of California. Wood will shrink, and California redwood will shrink endways as well as any other may. The frail but fancy work adopted in many of the dwellings under notice have become so warped and the joints so opened by shrinkage, that one would imagine the houses were twenty years old instead of but three. Another cause for the cracking, twisting, and shrinkage of the fancywork lies in the fact that from the intricacies of the different parts of the work, much of it does not receive a single touch of paint. That exposed to the gaze is well covered, but all the little nooks, corners, and parts that cannot be seen from the street, although readily accessible from a staging, fail to receive a single touch of that which is absolutely necessary to prevent lumber from cracking and shrinking, and so after a few years much of the "gingerbread" has to be removed, that the house may present a creditable appearance.

In our April number, 1882, we presented to our readers a letter from Mr. Eastlake, giving his views in regard to the style of Architecture named after him. The modesty of the gentleman mentioned forbade him saying anything more than to discountenance the use of his name to the style mentioned.

Briefly stated, his views are as follows: He "recommends good honest work, no dowels, no glue, no putty or paint, without any reference to the form of style of architecture, and his remarks and recommendations referred more particularly to furniture and inside than to outside decorations."

The grand principle of this style is contained in the two words—"honest work"; and when our architects and builders follow the true intent and meaning of those two words, they will lay the foundation for the coming new style of American Architecture.

San Francisco Chapter American Institute of Architects.

The regular monthly meeting of this Chapter was held in the rooms of San Francisco Art Association, on Friday evening, April 6th. President John Wright in the chair.

The minutes of preceding meeting were read and approved.

The Professors in charge of the various classes instituted by this Chapter reported as follows:

F. Marion Wells, in charge of the modeling class, reported that his class was well established, and the students took much interest in their study. He asked permission of the Chapter to procure casts from models in the Art Association for the benefit of the students. The Chapter acceded to his request, authorizing him to procure the necessary material, with the understanding that the bill for the same be presented at the next meeting.

Mr. Sanders, in charge of the class in drawing, reported very favorable progress of the pupils under his charge. It was the intention to have the pupils visit buildings in process of erection, and thus supplement office work by instruction in the practical part of the profession.

Mr. Pissis, in charge of the class in practical architecture, reported that he had given his class for a subject, the front entrance to the Mint. The first specimens were crude; he pointed out the defects and the remedy in each drawing, and a second trial by the students showed a vast improvement. He felt confident after another trial that their efforts would be worthy of insertion in the official organ of the Chapter.

Mr. Bryant, who is to have charge of the class in carving, was present, and expressed his willingness to give instruction as soon as a suitable place is procured. On motion, the Secretary was instructed to notify the Trustees of the Mechanics' Institute of the intention of this Chapter to establish a class in carving, and request them if possible to give a space in the fair building for the use of the students.

Proposition for membership as draughtsman was received from Mr. W. C. Jordan; Messrs Curlett, Moore, and Pissis were appointed a committee to report on same.

A work entitled "Charitable and Parochial Establishments," was received from H. Saxon Snell of London, England. It was examined with interest by all the members present. The Secretary was instructed to notify the donor of the acceptance of the work by the Chapter, and a unanimous vote of thanks was tendered the gentleman for his donation.

A portfolio of sketches was received from the Boston Architectural Association. (These sketches are published for the benefit of the profession at large, and complimentary copies are sent to the several Chapters of the A. I. A. for inspection.) Secretary was instructed to thank the Association for the kindness shown.

A committee of two—Wright and Curlett—were appointed to consider the feasibility of procuring a permanent room for the Association.

The picnic committee reported that arrangements were being made by which the Association, during the month, could visit the red woods in the neighborhood of Duncan's Mills. Report received, and the Association decided to go. The Secretary was instructed to visit the members and ascertain exactly how many could avail themselves of the opportunity.

Short Supply of Skilled Labor in San Francisco.

During the year 1882, there was at times a decided lack of skilled labor in all branches of mechanism in San Francisco, and at no time a surplus of good workmen; so much so, that signboards posted on buildings, "Carpenters Wanted," and on workshops, foundries, machine shops, etc., "Hands Wanted," were of common occurrence; and as an inducement, extra wages were in many cases offered. The brick-laying forces were also inadequate for the labor purposes of 1882, and but few jobs were carried through on time. With such a state of things prevailing during the past year, what may be expected for 1883, with the showing already made in these columns, of a threefold increase in the amount of building contracts let during the first quarter of 1883. We hope that among the thousands of new-comers to this State, there are a goodly number of first-class mechanics, all of whom will find ready employment. This shortness of labor supply is not confined to building mechanics, but extends to nearly if not quite all other classes of skilled labor. From inquiries among the machine shops, boiler makers, glass cutters, and others, we learn that the same condition of things exists, especially so as far as *competent* workmen are concerned.

Iron Girders over Store Fronts.

The cast-iron girder device used in the erection of Mr. Somer's building on Market Street was duly noticed in this journal, and recommended as possessing special, self-sustaining features, with no rests or bearings except at the ends—the centers being sustained by a perfect trap principle sufficient to carry ten times the weight placed upon them. We notice a similar modified girder construction in use in the building now in progress of erection on Mission Street between Fifth and Sixth Streets, which spans the respective openings without intervening supports between the ends. This is a desirable result in many cases, especially where open fronts are desired, while in any case, the girder referred to is unsurpassed for solidity and strength, and is less expensive than some of the other devices sometimes used. Mr. P. H. Jackson has devoted a very large amount of time and skill in working up this girder device, in which there is demonstrated a degree of mechanical science which should commend it to general favor. It is worthy the attention of architects and owners having in hand or contemplating the erection of brick buildings.

As Seen from the Railroad.

During the past month we visited the lower part of this State. But few new buildings are to be seen in progress of erection along the line of the railroad. The towns all seemed to be resting on improvements already completed. At Los Angeles, however, one sees on all sides evidences of prosperity. Numerous buildings are in process of erection on every side, some of them being fine four-story brick buildings. At Riverside and San Bernardino many building are in course of construction. Since the late rains everything has changed considerably, and every one seems to feel the effect of the welcome moisture. New buildings are talked of on every hand, and we hope next month to give a large report from this section. We have made arrangements by which hereafter we will receive the building intelligence from all the principal towns.

The new and enlarged edition of the Steel Square and its Uses, and the California Architect and Building News for one year, will be sent to any address upon receipt of $2.50.

Uses of the Steel Square.

Although all the matter given below may not strictly come under the head of Steel Square and its Uses, it has been placed in this column at the request of the parties sending us the questions that are answered; several of them are regular contributors to this series of articles, and desire to have all matter and questions together. In a short time, Part No. 1 will be finished, and our articles will then be devoted to the consideration of the more advanced mechanics.

EDS. ARCHITECT: "A flask-maker in a foundry often has occasion to change a square flask into an octagon. I want to know a rule by which the length of the pieces nailed in across the corners is obtained."

An octagon is always as 5 to 12. Take a flask 6 feet across; multiply 5 by 6=30, and divide by 12=2 feet 6 inches. Cut the miter to suit the above measurement, nail the pieces in the corners of the square box, and you have the required shape. That is, to find the length of the diagonal pieces multiply the width of box by 5, and divide the amount by 12.

In answer to questions in our last:

The above cut shows at a glance how the diameter and center of a circle can be found. Place the square as shown at A B C. The line B C will be the diameter. Place the square so that the point of the square A will touch any other point of the circle as at D, draw E F. The point of intersection H will be the center of the circle.

An ellipse can be made with the square by using that instrument in place of a trammel. The tracer or rod should have pins in the required points, which can be pressed against the inner sides of the square, as the rod is moved to form the ellipse.

J. C. is informed that no regular rule can be laid down for the projection of cornices on buildings. Much depends on the style of architecture employed. To use a general rule, however, we might say that for a building 70 feet in height, the proper projection should be about 36 inches.

Too much time and space would be required to fully answer E. R. in regard to the method of ascertaining exactly the proper sizes that *trimmers* and *headers* should be framed in order to carry any certain weight. In this State it is the usual custom in dwelling houses to make the headers either one inch thicker than the common joists, or else nail two pieces of the latter together. In stores and warehouses, the headers are generally of double thickness, or same rule can be used as for dwellings. The only advantage of the latter method is that it saves the necessity of providing pieces of extra thickness just for headers, etc. Trimmers should be of same size as the headers.

L. R. suggests an improvement in the construction of a trammel. Instead of the sides of the grooves being square, they are beveled so as to resemble dove-tails. The advantage of thus doing, is to prevent the small blocks used to slide in the grooves from slipping while describing the elliptic curve.

The grinding of tools so that a perfect bevel can be formed without unnecessary loss of material, is an accomplishment only gained by close attention and much practice One of the most common errors, especially of a novice, is to continue the grinding until a feather edge is formed. This is removed by drawing the edge across a piece of wood; after trying on his thumb the sharpness of the instrument being operated upon, a few more touches are given upon the stone. The chances are that another feather edge will be produced, and the above operation be repeated probably three or four times. This simply means a loss of from 1-32 to 1-16 of an inch of metal unused. The proper method is to grind the tool so that the edge will be of uniform thickness, and carefully noticing the limit to which it can be brought without producing a feather edge. After the latter has been formed, the operator is left without a guide to determine the thickness of the edge. Bring the edge of your tool near perfect as possible without feathering, and then finish the operation on an oil-stone.

Steel Square Miters.

In the June number of this journal, 1882, we presented an ORIGINAL diagram, giving the figures on the square, which, if used as per directions accompanying the engraving, would enable the mechanic to readily make the miter necessary to form any given figure.

The figures as given were obtained only after much labor and study. They were verified by a practical mechanic, and we presented them to our readers as being the FIRST ATTEMPT to give the general public the information contained in the article referred to.

In a late number of the *Carpenters' and Builders' Journal* we find all our figures quoted as original matter. In the April number of the *Builder and Wood Worker* we find our figures again quoted, giving credit to the first-named journal. We have noticed the same figures in several others besides these named.

We do not object to our exchanges copying any article that may be deemed worthy of a place in their columns, but we trust, at least, that due credit will be given for articles original with the editors of this journal.

This series of articles on the square was commenced in the September number 1881. Back numbers can be supplied at 20 cents each.

To E. F.: There are a great many preparations to coat blackboards, but the following is one of the best:

Alcohol 95 per cent. (4 pints); shellac, 8 ounces; lamp-black, 12 drachms; ultramarine blue, 20 drachms; powdered rotten stone, 4 ounces; powdered pumice stone, 6 ounces; dissolve the shellac in the alcohol, then add the other ingredients, finely powdered, and shake well. Be sure the surface of the boards are perfectly smooth and free from grease or dirt.

R. S. will find an answer to his question in the following:

The fancy imitation inlaid work now being introduced in the city is made as follows: The wood is first grained in oil; when dry, grain the whole in distemper; have a paper with the design drawn thereon, the back of which has been rubbed with whiting, place it on the wood, and with a pointed stick trace the design, then with a brush and quick varnish trace the whole of the design. When the varnish is dry, with a sponge and water remove the distemper where the varnish has not touched. This, if well executed, presents a most beautiful imitation of inlaid wood.

Articles which have been formerly glued, but broken again at the old place, should be thoroughly cleansed of all dirt and old glue by being soaked in hot water, using a sponge for the purpose. Do not attempt to scrape off the old material, or the pieces will no longer fit together. Dry the pieces thoroughly; warm the joints, reglue them, and you can be sure they will stick.

5 pounds of 4d nails are required to lay 1,000 shingles.

5¾ pounds of 3d fine nails are required to put on 1,000 laths.

Studding over 2 inches in thickness should have the 2 edges chamfered so that the plastering will have more room for a perfect key.

Setting out Stairs.

After determining the height of the riser from the "storey rod," the right proportion of tread must be found. Sometimes steps are arranged so that it is easier for a man to go up "two at a time" than to walk up in the proper manner. The reason is, both tread and riser are made small. When a riser is reduced, the tread must be increased; and the contrary when the riser is increased, the tread must be reduced in width. Joiners do not often break this rule, but masons very often do, notably in steps leading to and from railway stations. A simple rule may be given for finding a suitable proportion.

Take any suitable step as a standard step, that is to say, if you know of a staircase which is comfortable and easy to walk up, take it as a standard to gauge others by. Suppose you have a riser given, and require the width of a suitable tread, make use of the following proportion:

As the given riser : standard riser :: standard tread : required tread.

If the tread is given and the riser required, then—

As the given tread : standard tread :: standard riser : required riser.

To work out an example: Suppose 10 inch tread and 7 inch riser be taken as a suitable step, let 6 inch be the given riser; then by substituting the value of treads and risers for the names, we have—as 6′ : 7′ :: 10′ : the required tread; this gives $\frac{70}{6}$ or $11\frac{2}{3}$ for the size of a tread. Nicholson gives as a staddard a tread of 12′ to a riser of $5\frac{1}{2}$′. Working out the example given by this proportion, we get 11′ instead of $11\frac{2}{3}$′; either of these sizes will be an agreeable step.

A rough and ready rule for the *usual* sizes of treads and risers is to make 2 risers and one tread equal to 24 inches.

(From a new work entitled Handrailing and Staircasing.)

Unbalanced Bids.

This article is so pertinent to several similar transactions which have occurred in this city, that it is with pleasure we quote it from the *Sanitary Engineer* of February 15th:

A case illustrating the chance for fraud which exists in the ordinary method of letting work by contract to the lowest bidder, is now pending in the Supreme Court in this city.

A small sewer was to be built in the Twenty-third ward. An estimate was made by the assistant engineer in charge of that division, giving the probable quantities of the several items on which proposals were to be based, and by which the bids made were to be compared. This estimate was approved in due course by the engineer in chief of the department of parks, and the contract was advertised by the department. Several bids were received. The one which footed up the least was made by the son of the assistant engineer, who made up the estimate of the quantities. This bid was an "unbalanced" or "gambling" bid evidently, for the prices bid for all the items were very low except for "rock excavations," which was placed at $50 per cubic yard, while other bidders only bid from $5 to $7 per cubic yard for the same, but the quantity of rock excavation being estimated at only 10 cubic yards, the $50 bid was easily balanced by the low prices on the larger items. The law requires that every contract shall be let to the lowest bidder, and the Comptroller and the Park Commissioners could do nothing but award the work to this suspicious bid. But when the sewer was built it was found that there were 297 cubic yards of rock excavation instead of 10, and the contractor's final estimate for that item only was $14,850 for work not worth more than $1,500 at the most. This made the work cost the city some $13,000 more than it would if the contract had been awarded to a higher bidder on the first estimate.

The presumption of fraud in this case was so strong, owing to the peculiar relations of the assistant engineer and the successful bidder, that the chief engineer very properly took measures, in conjunction with the Comptroller, to resist the payment of the final estimate due under the contract. The contractor applied to the Supreme Court for a mandamus to compel payment, and Justice Barrett has refused to grant it, which will oblige the contractor to have the whole matter ventilated if he attempts to push his claim.

Now there was nothing inherently wrong in the contractor making such a bid as this if he had reason to believe that the amount of rock as given in the preliminary estimate would be largely exceeded in the execution of the work, provided that he had not received the grounds for his belief from his own father, who made the preliminary estimate. Many a reputable contractor has made such bids, based on his own judgment, of the unseen parts of work as opposed to that of the engineer, and has made money at it. It is sharp practice, but it is a legitimate business transaction. It is not fair, however, to the city or corporation which has to pay for the work, and its allowance offers great opportunities for fraudulent collusion, as in this case and in the cases of the canal contracts which were ventilated by Governor Tilden a few years ago.

A remedy for the evil has been sought by engineers, but so far no efficient mode of guarding against it has been put into practice. A plan which seemed to promise efficient results was devised a few years ago by the engineer of one of the city departments, who had intended to try it in the next contracts he was to let, but it happened that his head fell into the waste basket while he was preparing the papers, and his successor was afraid to venture on any new experiments until he knew whether his own head was secure on his shoulders. The plan suggested was to enumerate the items and their quantities as usual, and to affix to each a fair price for that class of work, and foot up the total. Then require each bidder to make a proposition to do the work for a gross sum, with the proviso that he should receive as full compensation for each class of work a price bearing the same proportion to the engineer's figures that his gross bid bore to the engineer's total estimate. To illustrate: Suppose that the engineer's estimate of a piece of work was:

100,000 cu. yds. earth excavation	@	$0.15	$15,000
10,000 cu. yds. rock	"	1.50	15,000
5,000 cu. yds. cut stone masonry	@	22.00	110,000
3,000 cu. yds. rubble masonry	@	6.00	18,000
2,200 cu. yds. concrete	@	5.00	11,000
Total			$169,000

Bidders would be required to name a gross sum. If, for instance, a contractor was satisfied that he could do the work for five per cent. less than the estimated cost, he would bid $160,550. In drawing the contract, the prices of all the items would be scaled down 5 per cent. and would be inserted in the contract thus:

For earth excavation	$0.14¼
For rock "	1.42½
For cut stone	20.90
For rubble	5.70
For concrete	4.75

Now if this work were let in the ordinary way, a contractor who had reason to believe the rock excavation would turn out to be much greater than was estimated, and that the rubble masonry would be increased, and the cut stone masonry diminished, might bid as follows:

For earth excavation,	100,000 cu. yds.	@ $0.10	$10,000
For rock,	10,000 cu. yds.	@ 9.00	90,000
For cut stone,	5,000 cu yds.	@ 5.00	15,000
For rubble,	3,000 cu yds	@ 11.00	33,000
For concrete,	2,200 cu yds.	@ 4.50	9,900
Total			$157,900

which would make his proposal $2,650 lower than the other man who bid fair prices.

If his surmise was correct, and the quantities were varied as he supposed, the two bids would stand as follows on the final estimate:

	By the fair bid.			By the unbalanced bid.	
Earth,	80,000 @ $0.14¼	$11,400		@ $0.10	$8,000
Rock,	30,000 @ 1.42½	4 275		@ 9.00	270,000
Cut stone,	2,000 @ 20.90	41,800		@ 3.00	6,000
Rubble,	6,000 @ 5.70	34,200		@ 11.00	66,000
Concrete,	2,200 @ 4.75	10,450		@ 4.50	9,900
Total		$102,125			$359,900

That is to say, the unbalanced bid, which was apparently the lowest, would result in costing the corporation more than three times as much as the fair bid, and would yield the contractor about 280 per cent. clear profits instead of the fair profit of 25 per cent. This is a very fair specimen of what can be either lost by careless or tricky methods of letting contracts to the lowest bidder, or saved by judicious methods. A competent engineer is as well able to judge of the proportionate prices which should be paid for certain classes of work as a contractor is. In fact, most large contractors now employ engineers to make up their figures for them, and if the proposed plan were put into practice, no attempt at fraud of the kind produced by unbalanced prices attached to erroneous quantities, could be made without being sure of immediate detection by the public and all the bidders.

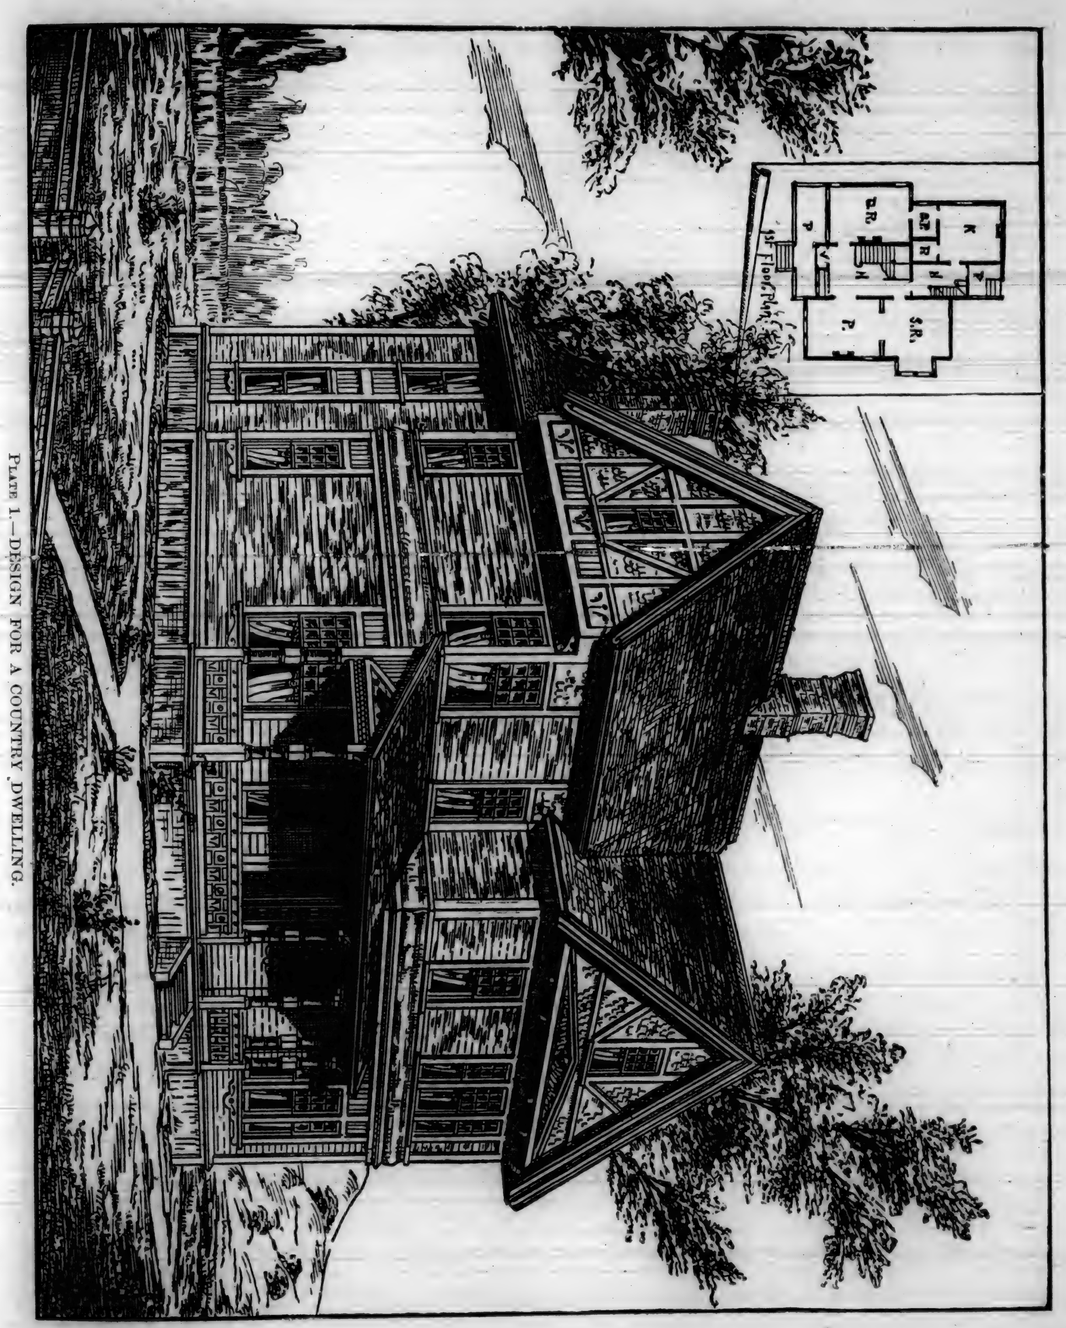

PLATE 1.—DESIGN FOR A COUNTRY DWELLING.

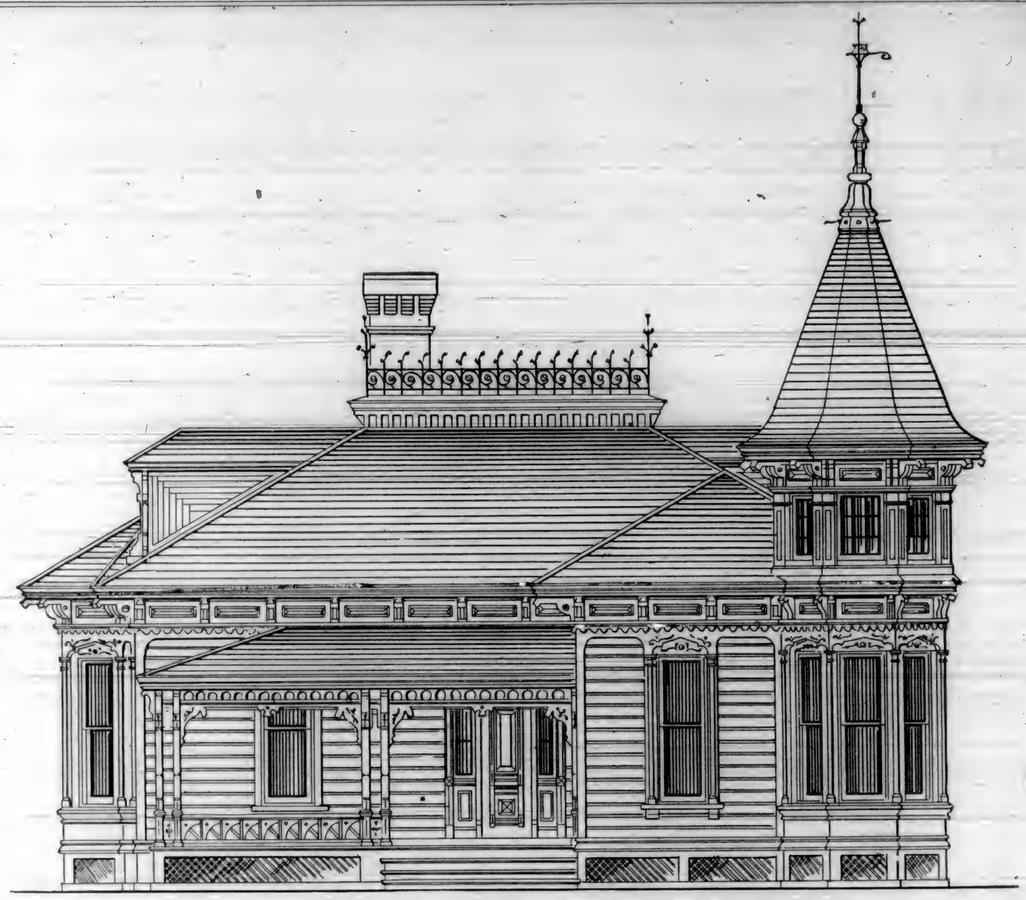

PLATE 2.—FRONT ELEVATION OF COUNTRY DWELLING COSTING ABOUT $3,500.

Our Illustrations.

Plate 1 represents a design for a commodious country dwelling. But little attempt has been made at ornamentation, the object being to present a showy house at as little cost as possible. The windows being placed in the corners is an innovation on the present popular style of bay-windows, and is certainly much less expensive. This building can be erected for from $4,500 to $6,000, depending altogether upon the styles and character of finishes used.

Plates 2, 3, and 4 show the plan, front and side elevations, of a beautiful country dwelling, costing about $3,500. This sum can be varied greatly, as almost double that amount could be used to advantage if extra nice finishes are employed. The amount quoted allows for as nice finish on the outside as is shown by the engraving and neat finishes inside. The arrangements of the rooms is such as to especially recommend the plan for a country dwelling. Stairs are shown leading to the attic. If desired, the elevation could be made 2½ ft. higher than shown, and the design thus changed into a 1½-story house. It will be noticed that the arrangement of the hall is such that in summer a perfect system of ventilation can be had, and in winter, by the use of the hall and other fireplaces, the home can be agreeably warmed in every part.

Plate 5 is an original design for a mantel.

English Wall Decoration.

There is one thing for which we cannot give the English too much praise, and that is their exquisite wall decorations. In this detail of house furnishing they are still a quarter of a century ahead of us. Some of the tile work is crude, and much of it is too sober in color; but there are public and private buildings in which the tile is employed with most exquisite taste. That there are very many gentlemen's mansions in America, where wall ornamentation is carried to a lofty, even an extravagant, pitch of splendor, I admit; but there is not one public restaurant or music hall or shop handsomely decorated in New York for every twenty in London and the minor English cities. In the theaters in England the decorating is lavish, but not tasteful. In the new Strand theater it is gaudy; and the Royalty, the Royal Comedy, the Novelty, and the other amusement halls are evidences of poor taste. But if one wishes to pay liberally he can have more comfort in any English than in an American theater. The decorations of the Savoy theater are lovely under the cool gleam of the electric light; there is nothing at once so original and pretty as this in Paris. The French seem to care but little for comfort in public places; fresh air is not one of their needs, and they hate innovations—literally hate them. Edward King, in *The Boston Journal*.

The California Redwood.

In Humboldt County, California, the whole area of the redwood forest has been mapped and platted. There are something over 500,000 acres of that timber in that county alone. Disinterested experts estimate 100,000 feet of lumber per acre as an average if not a small yield. At $18 per 1,000 feet the redwood of Humboldt County alone would just about pay the present national debt.—*Lumberman's Gazette.*

Index to Vols. 1–4.

All parties who desire a copy of this index should at once send to this office. We have had a large number printed, and in the confusion attending the distribution of so many, doubtless some will be overlooked. A postal directed to this office, will be answered by the immediate forwarding of a copy.

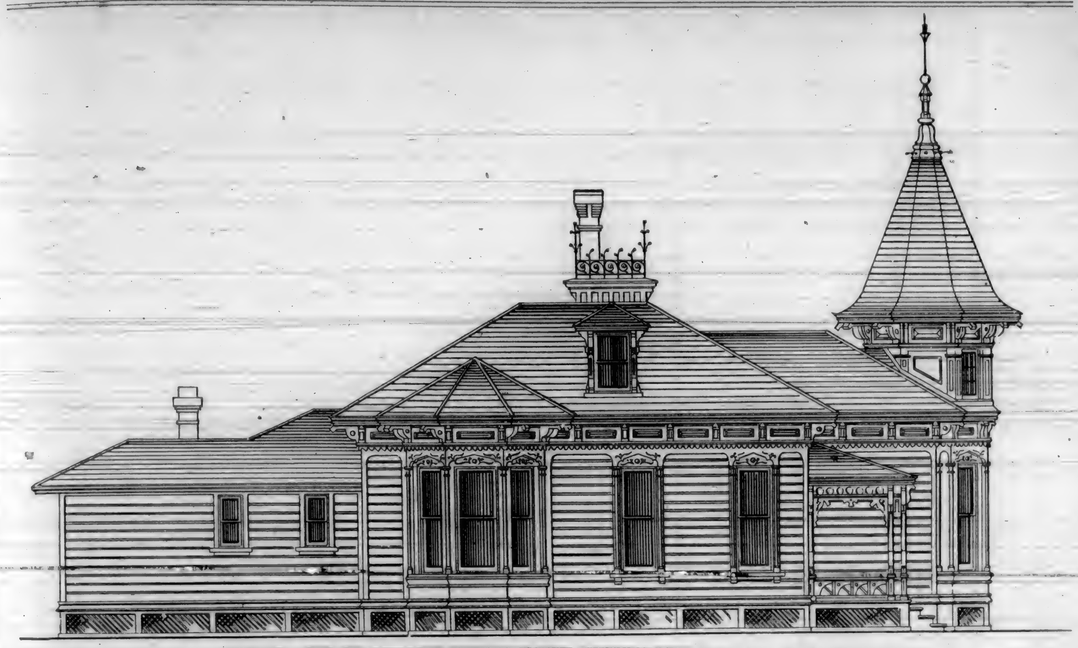

PLATE 3.—SIDE ELEVATION OF DWELLING COSTING ABOUT $3,500.

Tinting and Coloring.

There is a want felt by many when doing a little painting on their own account as to the mode of compounding the tints or colors they may wish to employ; and it is the purpose of this article to give a few hints which may prove useful to many readers of the ARCHITECT. There is a certain taste for fixing a tone to color which must necessarily come from a little practice and observation. For instance, some prime original colors, having more strength, will produce stronger effect when mixed in certain given proportions, but when of a weaker nature a larger proportion should be used to produce any given color. To make bright-toned colors, pure pigments should always be selected, and then the tone is clear and more decided. To make simple lead color, take white paint and add a little good black and a drop of blue, adding these carefully until the desired tint is obtained.

Light gray.—Is made with black and white.

Light buff.—Take yellow ochre and lighten with white.

Lemon color.—Lemon-yellow toned with white.

Stone color.—Take five parts of white lead, two of yellow, and one of burnt umber.

Straw color.—Add white to yellow of an orange tone.

Olive brown.—A little yellow added to burnt umber.

Oak color.—Lighten yellow ochre with white.

Tea green.—Mix raw umber, blue, and green to decide the shade.

Grass green.—Is made with yellow with a part of Prussian blue.

Pea green.—Lighten chrome green with white lead.

Bronze green.—Yellow deepened with black. Another shade is made by adding blue and umber.

Dove color.—Equal parts of white, blue, yellow, and red.

Fawn color.—Is made by mixing with white, yellow, red, and umber.

Snuff color.—Yellow with Van Dyke brown.

London smoke.—Van Dyke brown with yellow and white.

Chocolate color.—Indian red with black and yellow.

Claret color.—Vermilion and ultamarine blue.

Carnation red.—Carmine lake with white.

French red.—Indian red made light with English vermilion and tipped with carmine.

Copper color.—Yellow, vermilion, and black.

Maroon color.—Carmine with Naples yellow.

Rose color.—Carmine with flake white.

Drab color.—White lead with burnt umber.

French gray.—Light shade, white, yellow, and sienna. Deep, white, ochre, and Van Dyke brown.

The above formula applies to oil colors, but where color in water or distemper are used, for black use drop black, as that mixes freely. When colors are made, they should pass through a strainer, or they may be compressed with a muller or spatula on a marble slab. The latter method forms a smooth homogeneous paste paint, spreading evenly over any surface with a fine tone. J. E. W. C.

Salt and Sawdust.

The story is told in a Saginaw paper about a mill in that district that cut 18,000,000 feet of lumber annually, and the exhaust steam manufactured 20,000 bushels of salt. Thus the fuel for making the salt cost absolutely nothing. The slabs from the logs were sold for fuel at $1 per cord. That manufacturer made a fair thing on his logs, and if all could economize the product ike that, there would be but little need of bothlering aboutthe tariff question.

The new and enlarged edition of the Steel Square and its Uses, and the California Architect and Building News for one year, will be sent to any address upon receipt of $2 50.

Preventing Water Pipes from Bursting in Frosty Weather.

A simple method of preventing the bursting of water pipes during frosty weather has recently been patented by Drs. Buxton and Ross, and was exhibited at the late Electrical Exhibition at the Crystal Palace. A valve of special construction, called by the inventors a ventilating valve, is screwed or soldered into the end of the house main service-pipe in the cistern, and a piece of string or wire conducted from it to any convenient spot, and fastened to a nail or hook. When frost is expected, all that is needful is to unhook the spring, when the valve falls upon its seat, and air being admitted through the small pipe, which rises above the surface of the water, the pipes can be emptied by simply turning on the tap at the lowest point in the house service, the water in the cistern being saved. To obviate forgetfulness on the part of servants, the inventors have called in electricity to their aid. A thermometer of special construction is so arranged that when the temperature falls below 33°, a current is sent through an electro-magnet, which releases a catch, causing the valve to fall upon its seat, and at the same time opening a small pet cock at the lowest point in the house service, and draining the pipe. The battery is cut out by the fall of the catch, and when the valve is raised again, that water may flow into the pipes, the connection is made good. The electrical part of the apparatus is by no means an *essential* feature, but simply saves trouble, and prevents the possibility of allowing the pipes to remain full during frost, as the contrivance is rendered automotic by its agency.—*The Building News.*

CARPENTER AND JOINER MODERNIZED.

We will send the above work in connection with the California Architect and Building News for one year, upon receipt of $8.50.

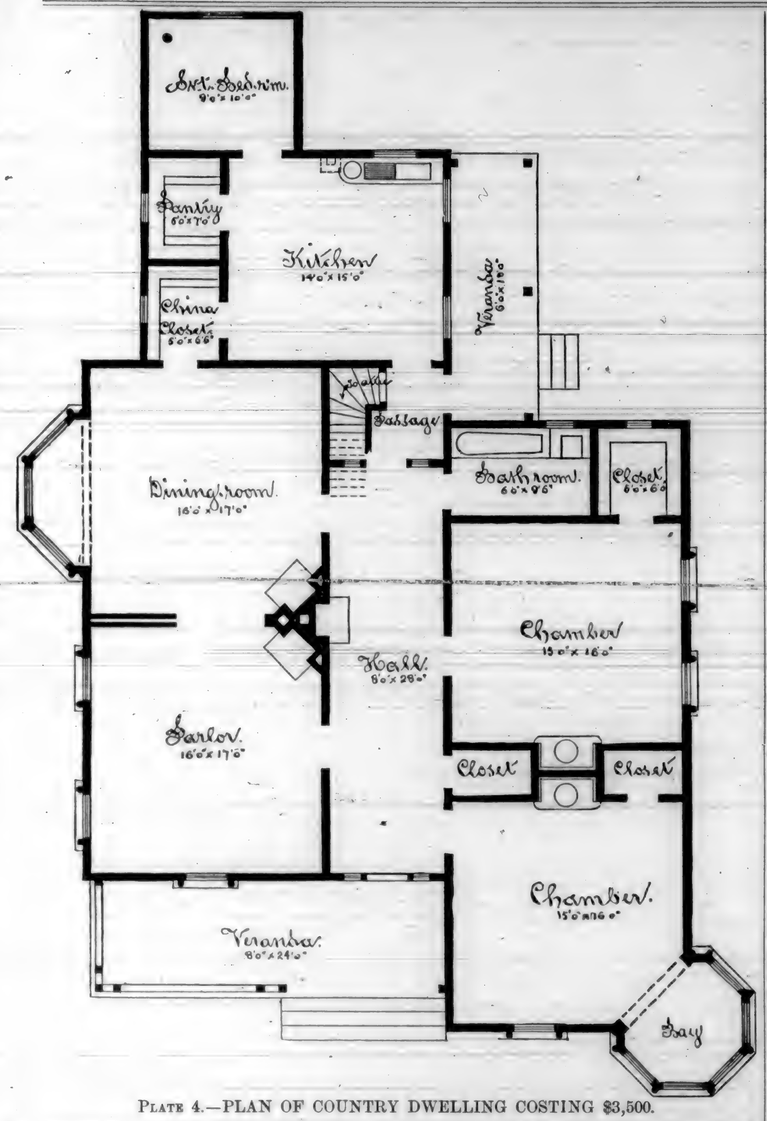

PLATE 4.—PLAN OF COUNTRY DWELLING COSTING $3,500.

Tin Roofs.

Tin roofing, to be good, must be put on with care, well turned up and over all angles, and flashed around all openings. As it is subject to expansion and contraction, leaks are always the result if proper allowances are not made. This is provided against by a raised standing joint, which costs a little more, but pays better by lasting longer; a flat joint is cheaper, but not durable. Tin should always be painted on the outer side of the sheets before using, as the sweating from condensation of vapor causes it to rust readily. Tin roofs should be painted thoroughly every two years, and in angles every fall. Tin sheets are 10x14 inches in size, and of different thickness; sized by X, XX, and XXX. XX is the best for general use, as the metal is thin, pliable, and less liable to crack under strain of contraction than thicker metal; anything thinner rusts through too easily. It is known among makers and dealers by different brands, which designate the quantity of tin actually used. Tin is bright, and of a silvery color; adheres in large, smooth flakes. Compositions of lead and tin, or zinc, are a dead smoky color, and last but a short time under the corrosive influences of salt air, smoke, and acids, these being principal causes of its decay.

It is stated that some kinds of woods, although of great durability in themselves, act upon each other to their mutual destruction. Experiments with cypress and walnut and cypress and cedar prove that they will rot each other when joined together, but on separation the decay will cease, and the timbers remain perfectly sound for a long period.

The Rights of Sanitation.

The time has arrived in this country for the stricter enforcement of a considerable body of miscellaneous sanitary law, and for the enactment and execution of new laws of the kind. This species of law, like all other law, has to struggle against ignorance, selfishness, perverseness, and wickedness. Underlying it will be found the well-defined principles of criminal law. If a man kills his neighbor, the criminal law inflicts the same penalty on him, whether he does the killing with poison, with a knife, with a club, or with a gun; but if he does the killing by means of beer poisoned with "multum," by means of a backhouse in the basement of a building let to a tenant, by means of milk containing germs of scarlet fever, by means of pork containing trichinæ, by means of tea containing a "bloom" of black lead, by means of wall-paper colored with arsenical pigments, by means of wine "doctored" to taste by admixture of plasterage," by means of a child sent to school bearing the contagion of deadly disease, by means of ships so crowded between decks with emigrants that each person has less than thirty cubic feet of air space, by means of a theater so constructed that even in case of *alarm* of fire a large percentage of the inmates are sure to be trampled to death, by means of a hospital built in defiance of every hygienic law as a monument to civic ignorance and pride, by means of a deadly drug administered by pretentious quackery—then the enactors of statutes consider their constituencies, and the elective magistrates look over their shoulders and out of the windows to observe the direction of the popular breeze. While it is very evident that public instruction must keep peace with law, it is also evident that malefactors who snap their fingers at preaching and teaching can be reached only by the infliction of dreaded penalties. The world can never be reformed by moral suasion alone.

Immanuel Kant, the most vigorous ethical soul in modern times, says: "When a man has made a worm of himself, he cannot complain if he is trampled under foot. If tenants, whose humble homes have been visited by the angel of death through the sanitary delinquency of a landlord, instead of passively submitting to their fate, would mob him and throw him into the stagnant pool under the building that he has refused to drain, or into the reeking cesspool that he has refused to clean, it would do more good than the best hygienic tract on sewer-gas ever written. If a thousand emigrants, after escaping from the foul dungeons of an ocean steamer, would turn around and abate the nuisance by burning it up—and there is some color of law for such a proceeding—it would do more public good than any act of Congress winked at by morally stupid officials. If the proprietor of an "Orange County Diary," known to be distributing milk from premises infected with small-pox, scarlatina, diphtheria, or typhoid fever, along a street where crape on many a door already indicates the sad fruits of his deadly trade, were set upon by an outraged community and hung on the nearest lamp-post, instead of being arraigned before a magistrate and "perhaps" fined ten dollars and costs, the summary proceeding would absolutely infuse a healthy ethical vigor into the makers and administrators of law." The public needs to be told again, in the trenchant language of Kant: "Let not your rights be trampled under foot by others unpunished." As long as we have a "stump tail" state of ethics on hygienic questions in the community, too rotten and feeble to beget sanitary indignation, we shall have plenty of interested men to trample uncomplaining worms under foot.—*O. W. Wight.*

Waste of the California Redwood.

The wastefulness of this lumbering is one of the striking features of the scene. Only the largest trees are cut, those measuring less than two feet in diameter rarely being touched, and the ax is laid, not to the roots (though they are not thick and widely divergent, considering the height and weight they support), but some distance above, so that in very large specimens the massive stump, upon whose flat top you might build a comfortable house, stands ten or twelve feet above the ground, and contains hundreds of feet of sound lumber, which must be left to rot or burn. Then many trees are broken by their fall, so that large parts of them are useless; other parts may be knotty, or crooked, or inconvenient to drag out, and so only half of a great trunk will be utilized. Huge logs are consumed, also, in road-making and bridge-building in the hills, and dozens of small trees are crushed by the fall of their greater companions. Then, when a district is pretty well cleared of its best timber, fire is set in the brush and prostrate trunks. Feeding eagerly upon the resinous woods, half dried and broken, it gathers so much heat that the saplings are nearly all killed, and the flaky, tinder-like bark of the larger trees is singed in a way which must greatly injure and often destroy them. Moreover, these fires, fanned by the gusty breezes rushing in every afternoon from the ocean, often get beyond control, and sweeping through the oily tops and brittle trunks, spread blackened ruin over miles and miles of precious forest. Precious, however, it seems never to occur to the lumberman that these forests are; yet he is probably no more wasteful and careless here than elsewhere, and finds his match for heedless extravagance in nearly every pursuit that deals in what nature furnished us at the outset in abundance, but replaces only very slowly, giving abundant leisure for our repentance. The spendthrift lumberman is bad enough, but no worse than the wasteful oysterman or buffalo-hunters, reckless of the future. It is, or ought to be, a matter of rejoicing to everybody that the foresty people, under Mr. Sargeant's guidance, are paying especial attention to preserving, as far as possible, the magnificent forests of the Coast Range.—*Harper's Magazine.*

The Way It Strikes a Layman.

QUEEN ANNE HOUSES.

Of all the absurdities of modern house-building, this attempt to push in the Queen Anne style of 1700 is the worst. The Queen Anne houses are not at all adapted to the times, and their absurdity has already begun to appear. In New York the style has fallen into discredit, and it will soon be as universally distasteful as it was a year ago universally popular. The Queen Anne houses will become a drug in the market, and they will depreciate the property on which they are located. They are not healthy. Their ceilings are low, and their interiors so constructed as to be ill ventilated and poisonously unhealthy. The laws of hygiene were comparatively unknown when Queen Anne lived, and the economy of warming the houses was a great consideration. Their huge fireplaces acted as ventilators, and the homes of that day were not as badly ventilated as their aped counterparts of the present. Had they possessed furnaces, gas and plate-glass, they would never have lived in such houses. The whole style is against the dictates of common sense. The houses are a disgrace to the intelligence and taste of the country, and their costly diamond-shaped windows are only a phase of the craze for the old and ugly which has swept over America. In two years hence the style will be discontinued in the smaller cities as it now is in the larger.—*Cleveland Leader.*

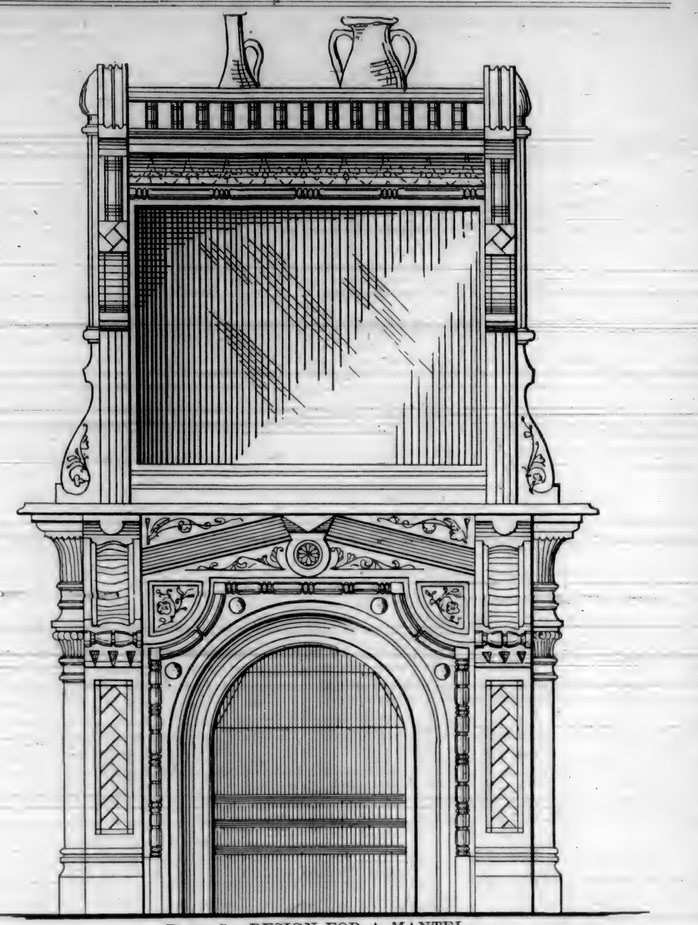

PLATE 5.—DESIGN FOR A MANTEL.

How Tacks are Made.

Described in a few words, the process of making tacks is as follows: The iron is received from the rolling mills in sheets from three inches to twelve inches wide, and from three feet to nine feet in length, the thickness varying, according to the kind of work into which it is to be made, from one-eighth to one-thirty-second of an inch. These sheets are all cut in about thirty-feet pieces, and by the immersion in acid cleaned of the hard outside flinty scale. They are then chopped into strips of a width corresponding to the length of the nail or tack required. Supposing the tack to be cut is an eight-ounce carpet-tack, the strip of iron, as chopped and ready for the machine, would be about eleven-sixteenths of an inch thick and three feet long. This piece is placed firmly in the feeding apparatus, and by this arrangement carried between the knives of the machine.

At each revolution of the balance-wheel the knives cut off a small piece from the end of this plate. The piece cut off is pointed at one end, and square for forming the head at the other. It is then carried between two dies by the action of the knives, and these dies, coming together, form the body of the tack under the head. Enough of the iron projects beyond the face of the dies to form the head, and while held firmly by them, a lever strikes this projecting piece into a round head. This, as we have said before, is all done during one revolution of the balance-wheel, and the knives, as soon as the tack drops from the machine, are ready to cut off another piece.

These machines are run at the rate of about two hundred and fifty revolutions per minute. The shoe-nail machines, for cutting headless shoe-nails, are run at about five hundred revolutions per minute, and cut from three to five nails at each revolution.

When we think of the number of machines now being run in the United States—about seventeen hundred—and of the quantity of tacks and nails they can produce, it is as much of a mystery where they go as it is what becomes of the pins.

The tack maker of fifty or sixty years ago worked as follows: He took a small rod of iron, and after heating it in a charcoal fire, hammered it down so as to make a point; then a piece was cut off, placed in a vise worked by foot power, and the head formed by a few blows of the hammer.—*The Artisan.*

Bird's-eye maple is used for firewood in Michigan, and sold for $160 a thousand in Liverpool.

The New Plumbing and Drainage Law.

The following act, entitled "An Act to grant to Boards of Health in cities and counties the power to regulate the plumbing and drainage of buildings," was passed at the late session of the Legislature of this State, and has received the signature of the Governor, and is therefore a law upon the statute books of California.

SECTION 1. On or before the first day of August, eighteen hundred and eighty-three, every master or journeyman plumber carrying on his trade shall, under such rules and regulations as the Board of Health of such [county] or city [and] county shall prescribe, register his name and address at the Health Office of such [county] or city and county; and, after the said date, it shall not be lawful for any person to carry on the trade of plumbing in any [county] or city and county, unless his name and address be registered as above provided.

SEC. 2. A list of the registered plumbers shall be published in the yearly report of the Health Office.

SEC. 3. The drainage and plumbing of all buildings, both public and private, hereafter erected in any [county], or city and county, shall be executed in accordance with plans previously approved, in writing, by the Board of Health of said [county], or city and county; suitable drawings and description of the said drainage and plumbing shall, in each case, be submitted and placed on file in the Health Office. The said Board of Health are also authorized to receive and place on file drawings and descriptions of the drainage and plumbing of buildings erected prior to the passage of this act.

SEC. 4. The Boards of Supervisors or other city or county officials, whose duty it is to make apportionments for the Board of Health of such [county or city] and county, shall make the necessary apportionment, and shall insert the same in the yearly tax levy, to provide for carrying out the provisions of this act.

SEC. 5. Any Court of record in said [county], or city and county, or any Judge or Justice thereof, shall have power to any time after the service of notice of the violation of any of the provisions of this act, and upon the affidavit of the Health Office or a member of the Board of Health of such [county], or city and county, to restrain by injunction order the further violation named in this act, or of any work upon or about the building or premises upon which the said violation exists, and no undertaking shall be required as a condition to the granting or issuing of such injunction, or by reason thereof.

SEC. 6. Any person violating any of the provisions of this act shall be deemed guilty of misdemeanor.

SEC. 7. This act shall take effect immediately.

The necessity of the enactment of a law which if enforced would limit and regulate the operations of that class of so-called plumbers who neither know nor care anything about sanitary sciences, and who are incompetent to fill places as competent journeyman plumbers, yet post themselves by sign-boards as practical sanitary plumbers, is an admitted fact among the competent plumbers and architects in San Francisco. Whether the bill just passed will accomplish the desired end, is a question yet to be solved. We have no questions as to the integrity and honesty of purpose on the part of those who secured the passage of the bill, and it may answer the purposes for which it was intended; but it might have been improved and made to cover the ground more clearly and thoroughly.

Section 1 calls for the registration of plumbers, which act of registration places all alike, good and bad, upon equal footing, securing no special advantage to the competent over the incompetent, but virtually acting as an indorsement of the very class of frauds who have created the necessity for the act. Section 2 simply authorizes the publication annually of all register plumbers, thereby helping the scaley class by placing their names before the public, among the names of good men, as practical plumbers. Section 3 makes the approval of plans by the Boards of Health obligatory, and creates the necessity of owners paying the extra cost and expense of preparing such plans, or of architects furnishing them gratuitously. Section 4 empowers Board of Supervisors to make the necessary apportionment for the carrying out of the provisions of the act; but the matter of costs and expenses are seemingly left to the discretion of the Boards of Health. Section 5 empowers any Court of competent jurisdiction to issue injunctions, etc. Section 6 defines all violations of the law as misdemeanors.

The act simply provides—more inferentially than positive—that Boards of Health shall have the power to define and regulate the means and methods "for carrying out the provisions of the act," and no limits are prescribed beyond which they shall not pass. It is presumable that such Boards will exercise all proper economies, and restrict expenditures within proper bounds; but as the law reads, extravagances and waste of public moneys are possible; and a strong public opposition is created by the fact, that under the law as it reads, Boards of Health may create places for one or several inspectors at liberal salaries, and use the power of appointment for political purposes. This is not likely to be the case in the first appointment, but hereafter such a course might be pursued. Another opposing argument is entertained in the suggestion that money in many cases may qualify merit, and scheming tinkers succeed in having their botchery passed for acceptable work. This is answered by the friends of the bill, by quoting in illustration the unimpeachableness of the gas inspector, who none will charge with the slightest irregularity. But there is a difference in the two positions. The gas inspector is exclusively under the control of the Gas Light Co., with no contingencies surrounding his appointment during good behavior; while the plumbing inspector will be liable to removal at every charge of the appointing power.

The law as passed is intended to serve a good purpose, and will so operate, so long as a qualified and honest man shall hold the position of inspector. There is also this other assurance that the spirit of the law will be enforced, viz.: Every worthy plumber will be interested in its proper enforcement, and should the appointee of the Board of Health—particularly in San Francisco—fail to discharge his duties correctly, there will always be some one to discover his irregularities and report them to headquarters, with a demand for his removal. The entire fraternity of competent plumbers will recognize the importance of watchfulness, and see that their individual interests are not tampered with by any one who shall receive the appointment of inspector, in allowing to pass any plumbing work not in accordance with the plans approved by he Board of Health. And as all such plans will be on file in the Health Office, they will be subject to inspection at all proper times, and any plumber or other person who may discover improper workmenship, or any trifling with the law, will have the right to investigate matters, and make such complaint as the nature of the case may warrant.

Since the foregoing was set in type, we have been handed a printed copy of "Rules for the Registration of Plumbers," as framed by the committee of plumbers appointed by the plumber association, which fully sets forth and defines the object of the law under notice, and develops the *modus operandi* by which the law is to be made both effectual and practical. Those rules have been prepared for submittal to the Board of Health, and if adopted by the board will qualify all seeming wants and omission in the law as past, and put at rest all the objections we have mentioned, and all that we have heard stated. With a strict enforcement of the "rules" before us, owners and tenants of buildings may rest assured that in the future a very different class of plumbing work will be done in this city, and the hitherto almost universal growl about sewer-gas and defective plumbing work will have ended. This one thing is a fixed fact—that the movement is in no way tinctured with politics, but is the outgrowth of positive necessity, and an effort on the part of the intelligent classes of practical plumbers, both masters and journeymen, to put an end to the mechanical demoralization which has in the past prevailed in the execution of plumbing work in San Francisco. As the rules referred to have not as yet been adopted by the Board of Health, and may be somewhat changed or modified before final adoption, we withhold their publication until perfected. But they are in harmony with the rules adopted by the New York Board of Health in connection with a similar plumbing law which has worked well in that city.

The Nine-Hour Movement.

The Carpenters' and Joiners' Union as an organization, representing as its name implies, the carpenters and joiners of this city, has made public the determination of its members to demand a lessening of the hours of labor from ten to nine hours per diem, without impairment of rates of wages. This conclusion has not been arrived at in haste, nor promulgated upon the spur of the moment, but is the result of prolonged deliberation and discussion; and from the standpoint occupied by those advocating the measure, the justice, fairness, and rightness of the movement is well sustained. But strong opposition will have to be encountered, and it will require more than the mere declaration of principles and rights on the part of mechanics to insure permanent success. We remember well the times—nearly fifty years ago—when the laboring classes of the country first unfolded the ten-hour banner, and resolved no longer to toil from the rising to the setting of the sun, nor to submit to that tyranny which made American freemen but little better than abject slaves, with the privileges and enjoyments of life limited to labor, eat, and sleep. The battle was fierce and protracted, but the right prevailed, and in due time the opposing elements calmed down to an acceptance of the situation.

Capital as a rule has always been arbitrary, exacting, and unyielding, demanding all that could be obtained from labor, with as small outlay as possible. "Grinding the poor" has been one of the curses inflicted upon humanity, and the source from whence has sprung the greater moral and social degeneracy of our race; and the great Author of all wisdom, truth, and love has pronounced in sacred history his utter and absolute condemnation of those who oppress the poor and make merchandise of the labors of human kind. The spirit of tyranny in some form more generally follows the acquisition of wealth. Yet we frequently read accounts of pleasing exceptions, in which the rich extend sympathy, relief, and comfort to the less fortunate, who live but little better than from hand to mouth, and of many good-hearted men who have acquired fortunes, doing noble things. But the underlying—the worm at the root—rule is, as far as labor is concerned, to utilize it to the advantage of capital, upon the most advantageous and economical terms. In manufacturing, building, and all other connections, the number of hours of labor and the pay of operatives become prominent factors. But few scruple at severe exactions to further their own interests, and the cry of "cheap labor" has been and is heard all over the world. And eyes eager for wealth have been and are turned in directions where the services of men and women can be had at least cost and with the shortest cessation from toil. The instances are few in which the financial and individual rights, interests, and comforts of the workers are first considered and fixed upon a broad and liberal basis. Long hours of labor and small pay to workers possess a fascination which blinds the minds of the larger number of employers of labor. Every one who expends money very naturally seeks to obtain the most that can be had for his outlay, but there is a rule of right and fairness, the going beyond which is neither just nor equitable.

We are well aware of the fact that the subject under discussion presents a thousand points of argument pro and con; and while we indorse and advocate all good and right movements calculated to advance the interests and better the conditions of the masses, especially those of the skilled labor classes, we advise caution, good judgment, and patience on the part of the Carpenters' and Joiners' Union, and mechanics generally. Too much haste and immature action have thwarted many a good purpose, and proved destructive to innumerable good causes.

The creation of a general sentiment in favor of any movement, and the pacification of adverse opinions, will prove far more powerful in any case than all the peremptory and arbitrary actions that can be resorted to; the former being conservative, convincing, and aggressive, while the latter tends to antagonisms and oppositions. The farmer who attempts to plant his fields without first removing the stubble and preparing the soil will have but poor return from his sowing.

In this view of the case, we presume that the carpenters and joiners have reviewed all the probabilities, and are prepared to meet the issues and responsibilities involved. The permanancy or failure of the movement is yet to be decided by practical experience. If, as all present conditions indicate, general prosperity is to continue in San Francisco, and the demand for skilled labor increased, the nine-hour rule will likely become a success, until a break-down in prosperities occurs; and even then the rule may be sustained, leaving the matter of wages to be regulated by any future stringency or reversal of building activities; for it may reasonably be anticipated that should the time arrive when again labor shall be in excess of demand, that either the nine hours or the rates of compensa- will be attacked.

The Nine-Hour Mass Meeting.

On the 30th of March, after the foregoing article had been written, the Carpenters' and Joiners' Union assembled in mass meeting, to the number of about three hundred. Speeches were made by several of those present, and the following resolution was adopted:

Resolved, That this meeting indorse the action of the Carpenters' and Joiners' Union in inaugurating the nine-hour system, and pledge ourselves to defend and sustain them in their endeavor to obtain the concession thus demanded.

A committee consisting of twelve members was then appointed to confer with the bosses, with the view of securing the consent and co-operation of the contractors in establishing the nine-hour rule as a day's labor. The moderation and manly fairness, and the absence of rash and hasty action on the part of the Union which has thus far characterized the movement, will do much toward furthering the object contemplated, and of placing it in its more favorable light before those who might otherwise be inclined to interpose opposition.

It is altogether likely that some employers will reject the proposition, and hurl anathemas at the proposed changes and those who have promoted it, with no fair or intelligent consideration of the arguments favoring the project. The contractedness and selfishness of some minds render them incapable of weighing facts and arguments not in accord with conclusions arrived at by them from premises exclusively one-sided and limited. It is a somewhat singular fact that oppositions to such movements as the one contemplated, and all others which seek to change long-established custom, are based upon *presumed and speculative effects*, with but little reference to the rights, comforts, or equities of those who ask concessions or relief. But we agree with no theory or doctrine which proposes to benefit certain classes at the sacrifice of the greater number, who perforce of circumstances are compelled to operate in dependent situations. For it must be admitted that every man and woman who lives by the product of personal toil is in that sense dependent, with the contingencies of life resting upon the more or less uncertain demand for such labor. But that fact does not sanctify the means and measures sometimes adopted to oppress labor and humiliate it at the feet of capital.

NEW PUBLICATIONS.

Cutting Tools Worked by Hand and Machines. By R. H. SMITH.

The chief object of this work is to guide the mechanical student into a correct scientific way of thinking about tools, so that they may be able, aided by practice, to judge *intelligently* whether a tool is good or bad, to criticise its details, and eventually to design new tools scientifically. It is of comparatively little importance that he should know whether the tool is in accordance with the pattern adopted by this or that maker. The author has deemed it of greater importance to explain fully a few than to mention all kinds of tools. It is written in an exceptionally easy and interesting style. It contains 224 pages, 51 wood-cuts, and 14 folding-plates. Price, $1.50.

Handrailing and Staircasing. By FRANK O. CRESWELL.

The system of handrailing introduced is simple and accurate; by its means, the face mold can be struck out on the material from which it is to be cut without the usual labor of projection and transferring. Practical working details of the stairs are given and explained, and it is the intention of this work to remove difficulties from the paths of beginners, and induce others to study this beautiful branch of an excellent trade. Price, $1.50.

Treatise on the Theory of the Construction of Bridges and Roofs. By DR VOLSON WOOD.

This is one of the most reliable and practical works that has yet been presented before the public for consideration. Every known form of bridge and roof construction is treated in a manner so as to give the student a correct and thorough knowledge of the subject. The examples are original, and many of them novel in character. The analysis is generally of a simple kind. Price, $2.50.

American House Carpenter. By R. G. HATFIELD.

This is a practical work on the art of building, comprising styles of architecture, strength of materials, construction of floors, framed girders, roof trusses, stairs, doors, mouldings, cornices, etc., with valuable tables giving the result of experiments made by the author in the strength of all kinds of building materials. This work is a valuable addition to the library of the architect, and almost indispensable to every scientific master mechanic. Price, $5.00.

Cameron's Plasterer's Manual.

Enlarged and revised edition; it contains all that was in the former edition, with all necessary corrections; in addition, it gives an entirely new chapter on practical suggestions and precautions; also new illustrations and additional recipes. Price, 75 cts.

Grimshaw on Saws.

We have just received a lot of this the most celebrated work of its kind extant. Every mill man or owner on this coast, should possess a copy. In it is found the details of the manufacture, filing, setting, swaging, gumming, etc., of every kind of saws; a list of new patents; capacities of saw mills; tables of gauges, and other valuable information. 354 illustrations. Price, $4.00.

The Carpenter and Joiner Modernized.

This valuable work contains new matter of much interest to the carpenter, stair builder, carriage builder, cabinet maker, joiner, and mason. The progress of our age is as remarkable in the building, as in the other arts, and the chief branch of it—carpentry—has had its reformations as distinctly marked as ever changing fashion demands and the requirements of modern taste look for. The modes of meeting these are fully illustrated in this work. Price, $7.50.

Each book in above list will be sent any address upon receipt of the publisher's price.

Bricklaying.

Bricklaying is the art of building with bricks, or by uniting them by cement or mortar into various forms.

The implements used by the bricklayer are a trowel, for spreading mortar and breaking bricks when a piece smaller than a whole brick is required; a hammer for making openings in the brickwork and for driving or dividing bricks, for which purposes one end is formed like a common hammer, and the other is broad and flattened, somewhat after the manner of an ax; the plumbrule, made generally of wood, having a longitudinal opening down its middle and a plummet suspended from its upper end, for carrying walls up perpendicularly; the level, consisting of a long horizontal arm, having a perpendicular branch carrying a vertical arm from which a plummet is suspended; a large square for laying out the sides of a building at right angles; a rod, usually five or ten feet long, for measuring lengths; compasses, for traversing arches and vaults; a line and line pins, for keeping the courses straight and level as the work progresses; and a hod, for carrying bricks and mortar to the workman.

Bricks are laid in courses so as to break joints, and their arrangement with regard to each other constitutes what is called the bond. There are two kinds of bond used in England and America—English, or old English, and Flemish—the former, however, being much more commonly employed than the latter.

The term "bond" generally means that part or those parts of a built structure which tie the other portions together.

In masonry it is a stone or brick which is laid with its length across a wall, or extends through the facing course into that behind, so as to bind the facing to the backing. Also known as binders, bond-stones, binding-stones, through-stones, perpend-stones, headers.

Perpend signifies that a heading stone passes through the whole thickness of a wall; binder, that it extends part of the distance across.

In what is known as heart-bond, in stone walling, there are no perpend stones, but two headers meet in the middle of the wall, and the joint between them is covered by another header.

Chain-bond is the building into the masonry of an iron chain or bar, or heavy scantling.

A cross-bond is a block-bond in which the joints of the second stretcher-course comes in the middle of the first; a course of headers and stretchers intervening.

In block and cross bond the extrados of the wall is put up in cross-bond; the intrados in block-bond.

In bricklaying, in English bond, the courses of headers alternate with the courses of stretchers. In the Flemish bond each course has headers and stretches alternately. It need hardly be remarked that the stretchers are those bricks which are placed lengthwise of the wall, and the headers are those laid endwise.—*Brick, Tile and Metal Review.*

We have received from Palliser & Co. plans and specifications of a modern 8-room cottage with tower, also showing how it can be built without tower, with only six rooms. These plans are finely finished, and give full details of mantels, stairs, doors and casings, cornices, etc. They also send us blank specifications for frame or brick buildings, costing $500 to $5,000, which include two of their new blank forms of building contract. These are perfect, have been drawn with great care and precision, and have been recently published. Architects and builders would do well to write to this office for information concerning these forms, which are in every way complete, convenient, and suitable for the purposes intended.

Dry Rot and Worm-Eaten Wood.

A question on this subject having been recently asked in the columns of our contemporary, the *Building News*, Mr. W. Stevenson, of Hull, has supplied the following answer, which will be read with interest by wood-workers in general: "Dry rot," he says, "is a term applied to damp wood under process of destruction by fungi, or low forms of vegetation. The albumen and the essential oils in the wood become the food of this secondary or parasitic vegetation; the woody tissue is broken up, and the walls of the cells destroyed, an earthy, powdery matter being left as the residue. This residue bears on its face a close resemblance to burnt or charred wood. Indeed, it is akin to burnt wood, for the albuminoid sand the essential oils, which escape under the influence and form the food of fires, have been consumed or absorbed by parasitic vegetation. The residue, an earthy, inflamable substance, is practically identical with that resulting from fire. Dry rot, or the destruction of wood by secondary forms of vegetation, is dependent upon two conditions—heat and moisture. To prevent dry rot, the wood is dried or seasoned, by which one of the elements is withdrawn. To guard against the return of this one element, the wood is painted or varnished, and hence the general application of paint or varnish. Where wood cannot be painted, preservatives are used, the object of which is to change the character of the wood, so far as its secretionary matter is concerned. In this direction, creosoting is the most common or customary, the object of which is to poison the albuminoids and the essential oils, and so render them unfit for food to low or secondary forms of vegetable life. Salts, sodas, and metallic injections have the same effect, but they are in large degree soluble in water, and in course of time become weak or disappear, and consequently they are not so largely or generally used as creosote oil. The amount of moisture necessary for the support of this secondary vegetation is very large. This is supplied by humid or stagnant air, or by damp walls or subsoils, and hence it follows that wood subject to passing air, or brought under the influence of vegetation, is free from this disease or dissolution.

"Worm-eaten wood is wood injured by mechanical action, i. e., by animal life. The same conditions are imperative to the support of this form of life as to the above, but the amount of moisture necessary in this case is very small campared with that required for the support of vegetation. Wood to be worm-eaten must be subject to damp, humid, or stagnant air, and it must be a sweet wood or the sap of a bitter or pungent wood. Ash, elm, walnut, birch, beech, and lime-tree are sweet woods, and very subject to worms. Oak and resinous wood are bitter, pungent, or unpalatable, and, except in the sap-wood, are fairly free or proof against the attack of worms. Under certain conditions, as in the roofs of churches covered down with lead, where condensation of the atmosphere ensues, and the wood absorbs the moisture, the heart-wood of even oak will fall a prey to the action of worms. In some cases the necessary moisture is supplied by the ends of the beams being inserted in walls, the materials of which are porous stone. Here the damp ends of the beams will be riddled with worms, and sponge-like, they will crumble away, and, if not supported, will fall clear off the walls. The heart-wood in this case seems to have lost its pungent qualities and to have become soft with long saturation; but, not having been seized upon by fungi, to still retain its albuminoids, and to be sufficiently endowed with them to form the food of worms.

"As to the worms themselves, they are the grubs or larvæ of the furniture beetle (*Anoblum striatum*), better known as the book-worm, an insect that will bore through volumes in search of the book-binders' paste, which is composed of flour or albumen. The beetle is subject to four stages of life—1st, the egg; 2nd, the grub or larvæ; 3rd, the pupa or chrysalis; 4th, the perfect or winged insect. The parent deposits the egg, which is provided with a supply of albumen, as in the eggs of birds where we recognize it as the 'white of the egg.' Moisture and food are thus supplied to the insect, and heat is supplied from the rarefied atmosphere of the summer season. The egg is hatched in the hole or crevice in which the parent deposited it, upon which the instinct of the animal teaches it to bore into the wood. At this stage it is small, and has exhausted its stock of food. Its boring operations are performed by powerful forceps or mandibles attached to the head, by which it detaches fragments of wood, not for the sake of forming a habitation, as some observers believe, but for the purpose of food, the object being to extract the albumen from the wood as the particles are passed through its intestines. The result is, that the grub-worm, or larvæ, increases in size as it bores in and along the wood. It will avoid touching or breaking into the neighboring chamber, and in its tunneling operations shows a remarkable instinct—one worthy of most careful study. When the grub or worm has attained its full size, it will be found to be possessed of a black head and a long, round, fatty body, at which stage it changes to the pupa. The insect is then enveloped in a case or cocoeon, from which, after absorbing the fatty store or albuminous compound secreted by and in the body of the grub, or larvæ, it emerges a perfect winged insect, in which state it has power to liberate itself from its prison of wood. I have known them in this stage, when propagated in limewood carvings, to bore for the painted surface, and to actually bore through sundry coats of paint to effect their escape. The parent insect will not bore through, or lay eggs in or upon the paint, but will reach the naked wood through some crevice or joints between the junction of two pieces of wood. In the mature insect effecting its escape, it will bore through foreign matter, like paint, that would be poisonous to the young grub or larvæ. This is owing to the fact that the perfect insect is not boring for food and sustenance, but merely to effect its escape from its prison home."

CARPENTER AND JOINER MODERNIZED.

We will send the above work in connection with the California Architect and Building News for one year, upon receipt of $8.50.

Reduction of Postage.

The Post-office Department will soon issue a circular in view of the reduction of letter-postage, which takes effect October 1st, calling the attention of postmasters and the public generally to the fact, and admonishing the former to cut down the stock of stamps kept on hand. No steps have yet been taken toward the issuing of a new stamp other than that the head of Washington, which now ornaments the three-cent stamp, will be printed upon the new two-cent issues. The color and design for the stamp have not yet been determined, but will erelong, so that in the intervening six months everything may be made ready for the change. The Canadian Government has decided not to follow the example of the United States in establishing two-cent postage.

The California Architect and Building News for one year, with a copy of the Carpenter's Pocket Companion, will be sent to any address upon receipt of $2.50.

Buying vs. Building.

The statement often made that it is cheaper to buy than to build, even when followed by the large qualification—if one can find what suits him—is erroneous. It is true, there are foreclosed mortgages, auction sales of household goods, and pawn-brokers' shops, by means of which real estate and personal property change hands with little regard for actual values, and chances to buy at low rates are often found. So there are men who build houses for themselves, which, proving unsatisfactory, their owners are willing to sell for less than their cost. There are others who, through change of residence or inability to pay their debts, are compelled to part with their homes at a pecuniary sacrifice; and speculative builders not infrequently push their enterprise so far during prosperous periods that when the real estate pendulum swings to the off-side they are compelled to unload at any price, even if such one-sided operations upset them into the slough of bankruptcy. All these things are common enough, more's the pity. Yet it is a mistake to suppose that on legitimate business grounds it is cheaper to buy than to build. Old homes cannot well be compared with new, for their relative values would be largely a matter of taste and opinion, affected more or less by change of position and the varying circumstances of different cases. It should be remembered, in favor of the new, that wooden houses as commonly built deteriorate rapidly, and the cost of improvements and repairs will increase with age—expenses that ought not to exist during the first five or ten years of the life of a new building.

As regards the houses built for sale and those built by their owners for their own occupation, there is no good reason why the latter should cost more than the former. For the common impression to that effect there are several reasons. It is assumed that the same principle applies in house-building as in some other kinds of business; and the more extensive the manufacture, the cheaper will be the product. This is true to a very limited extent only, because, as a rule, each house differs from every other in some degree, and because the best results in building require a large proportion of skilled, intelligent workmen. Another reason for this opinion seems to be based upon the most solid of all grounds—every-day experience. Men wishing to build for themselves are offered houses that are satisfactory in size and quality, at lower prices than any estimates they are able to get upon *what seems to them* the same thing, modified slightly to suit their special needs. But in the majority of cases they are not the same thing. When a man follows the building of his own house, either in the actual work or through minutely drawn plans and specifications, he expects and demands at every step, from the mouth of the drain to the top of the smoke flue, a perfection and thoroughness in all the materials and workmanship visible and invisible, that are not often found in houses built "for sale," but which he would not care for in his own if he had not seen it until it was completed. In brief, whether he intends it or not, he virtually expects the house he builds to be better than the one he would buy, not only better suited to his needs, but better in construction. For the same thing it would cost him no more to build than to buy, but he is never quite satisfied with the "same thing."—*The Builder.*

Carpenters should remember that fresh glue dries much more readily than that which has been once or twice melted. The finest ordinary glue, or that made from white bones, absorbs twelve times its weight of water in twenty-four hours; from dark bones the glue absorbs nine times its weight of water, while the ordinary glue, made from animal refuse, absorbs but three to five times its weight of water.

Building Prosperities of Portland, Oregon.

Building operations in this fair city of the North-west, are at present very lively, and from advices received from architects and builders, the present year will outrank any previous record in the number of new buildings erected.

From the columns of *The Commercial Herald*, a new aspirant for public favor, and from its appearance and the ability of its editorials, well worthy of support, we are enabled to present the following record of new buildings now in process of construction:

Brick building soon to be constructed on corner Fourth and Yamill streets. Size 100x100, 4 stories in height. Two story frame, corner East Park and D streets; owner, P. Taylor; contractor, J. C. Bennet; cost, $6,000.

J. Slavig is building a two-story frame residence, corner Sixth and Clay, to cost $3,800.

F. Opitz will construct a three-story brick block on the north-west corner of First and Pine at once.

Work has begun on the new Presbyterian church, corner of Fifth and J streets, East Portland.

Cleghorn & Bunting are rebuilding the old Eagle hotel, on Second street, between E and F, at a cost of $10,000.

H. H. Lone has under construction, on the south-east corner of Taylor and Ninth, a two-story residence costing $2,000.

The Long Island House, on the north-west corner of Front and C streets, will soon be replaced by a four-story brick.

Henry Weinhardt will soon commence construction of a four-story brick block, corner Second and Oak streets, 95x100.

Mrs. Vantine has a block of five residences under construction on Seventh, between Taylor and Yamhill, to cost $18,000.

Work on J. W. Cook's new brick block on Front street, between Ash and Pine, is progressing rapidly. It will cost about $35,000.

W. E. Robertson has commenced construction of two handsome residences on the south-east corner of Taylor and East Park streets.

A handsome residence is about to be constructed by Hon. H. W. Corbett, for his son, in the vicinity of Bishop Scott grammar school.

Captain Lewis Love will erect another large frame block on the south-west corner of Front and Clay, immediately back of his new hotel.

H. Fleckenstein has in course of erection a block of handsome residences on East Park, between Montgomery and Harrison, to cost about $25,000.

Work on the dock and warehouse of W. S. Ladd, at the foot of Taylor street, is being vigorously prosecuted. It will cost about $25,000 when completed.

H. E. Dosch, of Akin, Selling & Co., has a two-story dwelling-house in course of construction on Taylor, between West Park and Eighth, to cost about $3,000.

Foundation is being laid for Labbe Bros.' handsome four-story brick block on the north-east corner of Second and Washington. It will contain six stores.

J. A. Strowbridge's new three-story brick block on the north-east corner of Second and Yamhill will be 75x100 in size, and cost nearly $50,000 when completed.

Reconstruction of the J. C. Ainsworth building has been commenced, and a third story will be added to its previous height. Contractor, F. W. Lewis; cost, $20,000.

Goddard & Frazier have leased the property on the north-west corner of Sixth and C streets, and will commence the erection of a three-story livery stable at once.

Workmen are busily engaged tearing down the old stone foundation on the south-east corner of Front and Morrison streets, preparatory to the erection of a brick block.

A. H. Johnson will soon erect a four-story brick building to occupy the 100 feet square on the south-east corner of First and Taylor streets. It will cost about $100,000.

Workmen have moved the dwelling on the north-west corner of Fourth and Alder streets, and Mrs. Burk, owner of the property, will erect a building 25x60, for business purposes.

The excavation has been made and foundation commenced for Fred Bickel's new brick block, corner Front and C streets. The building will be 100x100, and cost about $50,000.

The two-story brick on the south-west corner of Front and Stark streets is to be torn down to make way for a handsome brick building three stories in height, to cost about $20,000.

The buildings on the lot adjoining the corner of First and Clay streets, east side, are being removed, and are to be replaced by a three-story brick. The property is owned by W. W. Spaulding.

Plans have been prepared by E. M. Burton for a row of three double residences for J. M. Kenworthy, of East Portland, to be erected on Seventh street near the Episcopal church. They will cost about $12,000.

A building will soon be erected by Messrs. D. P. Thompson and M. S. Burrell on the New Market block, north-east corner of Second and Ash streets. It will be 100x70 feet, and three or four stories high.

D. Goodsell has let the contract for a three-story frame block 50x70, on Third street near B. The building is to be completed by May 1st. The first floor will be occupied by stores, and the upper floors be fitted up for lodging rooms. Its cost will be about $10,000.

C. A. Malarkey has leased the quarter block on the north-west corner of Fourth and Morrison streets, and will remodel the present buildings into business houses, adding a new frame building to fill out the entire space leased.

Architect Sherwin is preparing plans for three handsome dwellings, to be erected by Hon. Geo. H. Williams on the half block immediately adjoining the fine residence he is erecting for himself near the Bishop Scott grammar school.

At a meeting of the board of trustees of the Odd Fellows' Orphans' Home, held last week, the plans and specifications of the building prepared by architect Krumbein were formally accepted. The cost of the building will approximate $10,000.

Construction of a $200,000 flouring mill, and $700,000 elevator in Albina, $250,000 iron works, $500,000 hotel, and $1,500,000 depot in Portland, and several hundred business blocks, stores, residences, etc., in Portland, East Portland, and Albina, during the coming season, will give to our city a building boom such as has never been witnessed in the North-west. It is likely that not less than $5,000,000 will be expended in new buildings alone during 1883.

The *Ledger* says the Episcopal college projected at New Tacoma is certain to be built. C. B. Wright, of Philadelphia, formerly President of the Northern Pacific Railroad Company, has pledged Bishop Paddock that if his friends would raise $50,000, he himself would add thereto $100,000. The Bishop, who is now in the East, announces that a large proportion of the $50,000 has been raised.

The old foundations on the ground immediately north of the National Hotel are being renovated by Canuto & Zanello. They have undertaken the contract to prepare them for a magnificent four-story brick to be erected thereon shortly. The material used for the foundation will be entirely of stone, and the extra work will probably amount to $20,000. The building will have a frontage on Front street of 100 feet.

The Willamette Iron Works have purchased the block bounded by Third, Fourth, G and H streets, paying $75,000 therefor, and will erect thereon a building for their new works. The entire plant, when completed, will have cost the comfortable sum of $250,000. The building will cover the entire block, and will be two and three stories in height, built of brick, stone, and iron, and will be completed by the last of September, but the company cannot move in before the first day of January, 1884. When finished, it will be the most complete and best arranged foundry west of Pennsylvania, and the largest on the North Pacific coast.

The authorities of the Taylor street M. E. church, have purchased of Mr. Skidmore for $14,500 a half block on the north side of Taylor street, between Tenth and Eleventh. It is proposed to erect on the new site a very fine tabernacle, costing from $35,000 to $40,000.

A commodious wharf will soon be built at Montesano.

Farmington, W. T., is to have a new steam flouring mill.

The Port Blakely saw-mill is cutting up logs as briskly as ever, at the rate of 180,000 feet a day.

A number of parties are looking at the Sinslaw country, with a view of building a saw-mill there.

The Oregon Improvement Company will soon begin building a fine wharf at Seattle, 240 feet long, running from Main to Washington street. The wharf will be built so as to leave a sixty-foot slip at the foot of Main street.

To Remove Clinkers From Stove Linings.

Once in a while we see in the papers directions for removing clinkers from the linings of stoves. Prevention being better than cure, I propose to show how they can be prevented. Three years ago I put a new lining in a No. 3 Magee heater, and no one would imagine, from examining it to-day, that it had been used more than a week. With a piece of iron about half an inch wide, bent to reach the whole lining, I scraped the surface of the lining, shake down lightly, and then put on coal. Kindlings will be required if the fire has been left to get too low, but it is better to do this earlier, as it keeps a steadier fire, and takes no more coal. I think I can explain it on correct principles. When the fire is the hottest, there are no ashes; but as the heat has decreased, the ashes have formed and settled down against the lining, and shaking does not wholly remove them. If more coal is added, the heat is sufficient to fuse the ashes on to the lining, and there they stay. Each time this is repeated more ashes adhere, and it does not take long to spoil the lining. I scraped these ashes off thoroughly the first thing, and none adhere, and it seems that the lining will never wear out.

There is another thing to be noticed. If one stirs a coal fire at the top, in the center, the fire generally goes out, because cold air goes up through the centre; but by scraping around the outside of the fire, and leaving the center undisturbed, the air going up around the fire slightly cools off the lining, and the coal in the center retains its heat sufficient to burn up again quickly without kindlings, if the replenishing has not been too long delayed. The grate must be let down often enough to prevent the accumulation of clinkers in the bottom. Once or twice a week I let down my great, replace it, and put in some wood, then some of the live coals on the top, when it burns up immediately. I then put on a hodful of coal and close the stove, and have a fire at once without the heat having gone down, and so keep a good fire all winter. This can be depended on: that scraping the ashes from the lining before replenishing a fire—*every time*—will effectually prevent clinkers from adhering.—*Ex.*

SAN FRANCISCO.

Octavia x Pine & California. Two-story and attic frame.
O.—S. Sussman.
A.—Schmidt & Havens.
C.—Thos. Moffat.
$15,000.

Mission & Bond. Frame-building, flats.
O.—Mrs. M. Brown.
A.—Schmidt & Havens.
C.—Terrill & Slaven.
$6,800.

Hyde x Post & Geary. Two two-story and basement frame.
O.—Mrs. C. Lauenstein.
A.—Schmidt & Havens.
C.—Haskell & White.
$5,500.

Buchanan & California. Alterations.
O.—A. Monpelier.
A.—Schmidt & Havens.
C.—F. Klatt.
$1,500.

Mission & Twelfth & Thirteenth. Three two-story frame.
O.—C. C. Vorrath.
A.—G. E. Voelkel.
C.—Thom Wohrden.
$12,000.

Natoma x Tenth & Eleventh. Two-story frame.
O.—C Dunker.
A.—Schmidt & Havens.
C.—T. C. Riddell.
$2 500.

Eddy x Polk & Larkin. Four two-story frame.
O.—E. & J. Dusenbury.
A. Schmidt & Havens.
C. Terrill & Slaven.
$16,000.

Franklin & Golden Gate Avenue. Alterations.
O.—K. Strauss.
A.—Schmidt & Havens.
C.—C. Chisholm.
$1,200.

Mission x Twelfth & Thirteenth. Two two-story frame.
O.—H. Sammi.
A.—G. E. Voelkel.
C.—Thom Wohrden.
$8,000.

California nr Montgomery. Alterations, Merchants' Exchange.
A.—Newsom & Gash.
C.—G. D. Nagle.
$4,400.

Post x Kearny & Dupont. Alterations.
O.—Hollis & Berts.
A.—H. D. Mitchell.
C.—Gonyeau.
$18,000.

Main nr Market. Two-story building.
O.—Schmidt Eng. Co.
A.—H. D. Mitchell.
C.—W. E. Stevens.
$1,800.

Excavations for proposed Dominican Church.
A.—T. J. Welsh.
C.—E. Kenney.
$3,485.

Octavia x McAllister & Golden Gate Av. Two-story and basement frame.
O.—Walker.
A.—W. Curlett.
C —Kincaid & Baldwin.
$5,000.

Golden Gate Av. x Laguna & Buchanan. Three-story frame.
O.—F. Grass.
A.—Schmidt & Havens.
C.—W. Langstaff.
$6,500.

O'Farrell x Taylor & Jones. Three-story frame.
O.—W. F. Robinson.
C.—Kincaid & Baldwin.
$7,000.

Leavenworth nr Sutter. Two-story and basement frame.
O.—Mrs. Jehus.
A.—Cleaveland & Swain.
C.—E. Watts.
$6,000.

Mission cor. Mary. Three-story and basement frame.
O.—Donahue.
A.—Smith.
C.—T. J. Welsh.
$8,000.

Ellis x Laguna & Buchanan. Two-story and basement frame.
O.—Blankbury.
A.—Kenitzer & Raun.
C.—E. Farrell.
$.

Ellis nr Buchanan. Two-story and basement frame.
O.—Porter.
A.—Kenitzer & Raun.
C.—E. Farrell.
$.

Van Ness nr Ellis. Alterations.
O.—H. Sadler.
A.—Schmidt & Havens.
C.—W. Fluns.
$4,000.

Bush nr Baker. Two-story frame.
O.—J. W. Wetmore.
A.—McDougall & Son.
C.—J. H. McKay.
$5,000.

Waller nr Steiner. One-story and basement frame.
O.—Strasser.
A.—Geo. Miller.
C.—J. Blake.
$1,300.

Bartlett nr Twenty-third. Two-story frame.
O.—Capt. Stockfleth.
A.—H. C. Macy.
C.—L. D. Frichett.
$3,200.

Capp x Twenty-third and Twenty-fourth. Two-story and basement frame.
O.—C. H. Evans.
A.—S. & J. C. Newsom.
C.—J. Doherty.
$5,500.

Ellis x Hyde & Leavenworth. Two-story frame.
O.—R. H. Lloyd.
A.—Kenitzer and Raun.
C.—Conrad & Miller.
$8,000.

Turk x Hyde & Leavenworth. Two-story basement frame.
O.—Mrs. Manning.
A.—Schmidt & Havens.
C.—Heald & Gillespie.
$5,000.

Dolores nr Twenty-third. Two-story frame,
O.—N. Stone.
B.—M. H. Colley.
$6,000.

Dolores x Twenty-third and Twenty-fourth. Two-story frame.
O.—F. Sandborn,
B.—M. H. Colley.
$6,000.

Fifth and Harrison. Additions.
O.—J. Martin.
Day's work.
$2,500.

Mission nr Eighteenth. Two-story frame.
O.—C. Herring.
A.—H. Geilfuss.
C.—P. Stecher.
$2,500.

Twenty-second nr Valencia. Two-story frame.
O.—Mrs. Lewis.
C.—W. Walsh.
$3,000.

Twenty-eighth x Dolores & Church. One-story and basement frame.
O.—Wm. Dodd.
Day's work.
$1,100.

Twenty-eighth & Guerrero. Two one-story frame.
O.—Mr. Klavensawl.
C.—Lanfian.
$1,000.

Guerrero & Fair Oaks. Two one-story and basement frame.
O.—J. Cronigal.
A.—R. Warren.
C.—L. Larivee.
$3,300.

Shotwell x Fourteenth & Fifteenth. Two-story basement frame.
O.—Mrs. C. Schreiber.
A.—H. Geilfuss.
C.—R. Doyle.
$3,900.

Stevenson nr Twentieth. Alterations.
O.—S. Moore.
Day's work.
$2,000.

Twenty-eighth nr Dolores. Two-story frame.
O.—J. Riper.
C.—R. Bergfeld.
$2,000.

Sanchez Av. x Twenty-seven & Twenty-eighth. Alterations.
O.—J. Lind.
C.—J. Cordano.
$500.

Shotwell x Nineteenth and Twentieth. One-story frame.
O. & B.—J. H. Patton.
$1,000.

Stevenson nr Ninth. Three-story and basement frame.
O.—J. Kirk.
A.—Geo. Miller.
C.—G. Hansbrough.
$7,000.

Washington cor Larkin. Two two-story and basement frame.
O.—Chas. Hinkle.
Day's work.
$6,500.

Washington cor Fillmore. One story frame.
O.—G. Uhl.
A.—C. Mau.
C.—Treadwell & Thompson.

Broderick nr Bush. Thirteen two-story frame.
O.—Chas. Hinkle.
Day's work.
$45,000.

California cor Devisadero. One-story and basement frame.
O.—J. A. Keene.
A.—Kenitzer & Raun.
C.—Moore Bros.
$10,000.

Washington x Polk & Van Ness. Additions.
O.—J. F. English.
C.—W. Wharff.

Pacific nr Van Ness Avenue. Two-story frame.
O.—W. F. Canham.
C.—T. Lasby.
$1,000.

Clay cor. Broderick. Two-story frame.
O.—Shortsline.
A.—Geilfuss.
C. Conrad & Miller.
$3,000.

Seaside Gardens. Presidio Pavilion.
O.—Hink & Burkhardt.
A.—C. Mau.
C.—B. Dryer.
$7,000.

Seventh x Folsom & Howard. Additions.
O.—H. Boyle.
A.—Eisen & Co.
C.—T. J. Hamilton.
$1,500.

Eighteenth nr Howard. Two-story and basement frame.
O.—James.
A.—G. A. Bordwell.
C.—Gray & Stover.
$3,000.

Front x Filbert & Union. One-story brick.
O.—American Sugar Refinery.
C.—C. Shoenmaker.
$20,000.

Laguna cor. Fell. Additions.
O.—C. Gienger.
C.—Thom. Wohrden.

Fillmore cor. California. Alterations.
O.—C. Nobmann.
A.—Voelkel.
C.—Cook & Johnson.

Ninth x Bryant & Harrison. Three story frame.
O.—Pacific Box Factory.
A.—Mooser & Depierre.
C.—D. Roy.
$7,000.

California x Broderick & Baker. Two-story frame.
O.—W. Martin.
A.—H. T. Bestor.
C.—Girvin & Munn.
$5,000.

Gough & Ivy Av. Two two-story frame.
O.—M. Cazelis.
A.—Huerne & Everett.
C.—Kreger.
$4,000.

Fair Oaks cor. Twenty-fourth. One-story frame.
O.—T. Le Huquet.
A.—Moore.
C.—Terrill & Slaven.

Washington nr Broderick. Two-story frame.
O.—J. Mellody.
A.—Moore.
C.—Langstaff.

OAKLAND.

Cor. Fifteenth & Brush. Two-story barn.
O.—E. B. Dean.
A.—Matthews & Son.
Day's work.
$2,500.

Madison x Fifteenth and Lake. Two-story frame.
O.—Merritt.
Day's work.
$7,500.

Filbert x Eighth & Tenth. Two-story frame.
O.—H. Althorp.
A.—C. Mau.
C.—W. Dahl.
$6,000.

Third and Market. Two-story frame.
O.—L. Marini.
A.—C. Mau.
C.—W. Dahl.
$3,000.

Centre & Eighth. Additions.
O.—J. Samm.
A.—C. Mau.
Day's work.
$800.

Broadway & Tenth. Two-story brick.
O.—F. Derger.
A.—Kenitzer & Raun.

Eighteenth nr San Pablo Av. Two-story frame.
O. & B.—W. F. Curtis.
$3,800.

Twenty-first nr San Pablo Av. One-story frame.
O.—H. Swail.
A.—Eisen & Co.
C.—Lockhart & Bentley.
$3,000.

West cor. Ninth. Two two-story frame.
O.—Col. Woods.
C.—Brown.
$4,800.

Brush cor. Ninth. Two two-story frame.
O.—Col. Woods.
C.—Brown.
$4,800.

Taylor cor. Wood. Two-story frame.
O.—J. Zieglemeyer.
Day's work.
$2,000.

Poplar nr Fourteenth. Two-story frame.
O.—B. C. Cavallier.
A.—McDougall & Son.
C.—W. P. Clark.
$2,000.

Seward nr Pine. One-story frame.
O.—A. S. Scofield.
C.—W. P. Kelley.
$650.

Oakland Avenue. Two-story frame.
O.—W. H. Rouse.
A.—Newsom & Gash.
C.—Knight & Littlefield.
$10,000.

Seward cor. Wood. Two-story frame.
O.—L. Hoffschmidt.
Day's work.
$2,000.

Seventh nr Union. Additions.
O. & B.—D. H. Matheson.
$800.

Fourteenth & Webster. Two-story frame.
O.—D. H. Ward.
A.—H. D. Mitchell.
O.—Hannah.
$5,000.

Brush & Thirteenth. Two-story frame.
O.—Thos. Smith.
A.—Matthews & Son.
Days' work.
$5,000.

ALAMEDA.

Alameda Av. x Willow & Chestnut. One-story frame.
O.—A. F. Cornell.
C.—A. Denke.
$2,500.

Union St. & Alameda Av. Two-story frame.
O.—Mrs. Rimrod.
A.—Babson & Seadler.
B.—Gilbert & Co.
$4,000.

Everett St. One-story cottage.
O.—Dr. Twichell.
B.—Gilbert & Co.
$1,600.

Santa Clara Av. nr Bay. Improvements.
O.—H. Dilling.
C.—Cutting.
$600.

Central Av. x Oak & Walnut. Three two-story frame.
O.—G. Zeh.
C.—Wassum & Pattiani.
$11 000.

San Jose Av. x Oak & Walnut. One-story frame.
O.—Brown.
C.—J. C. Jamieson.

Everett nr R. R. Av. One-story frame.
O.—Dr. Twichell.
B.—Gilbert & Co.
$1,800.

R. R. Av. x Oak & Walnut. Two story frame.
O.—Mrs. Brock.
C.—Christensen.
$7,000.

STOCKTON.

Four-story brick building.
O.—Masonic Hall Association.
A.—Percy & Hamilton.
C.—Confer Bros.
$60,000.

SACRAMENTO.

J x Second & Third. Two-story brick building.
O.—Heilbron.
A.—Babson & Seadler.
C.—D. & D. Falconer.
$5,300.

Seventh x J & K. Remodeling.
O.—Anderson & Johnson.
A.—Babson & Seadler.
C.—Thos. McCaffrey.
$1,400.

Fifteenth & M. One-story frame.
O.—Robertson.
C.—Falconer.
$2,500.

Tenth & N. Additions.
C.—Falconer.
Day's work.

SEATTLE.

Occidental Hotel.
O.—J. Collins.
A.—McKay.
$80,000.

Yesler Block.
A.—Boone.
$100,000.

Kenyon Block.
$5,000.

Public School Building.
$25,000.

Graves Building.
A.—W. E. Goodrich.
$8,000.

Frame dwelling.
O.—R. C. Farnsworth.
A.—Goodrich.

Chico. Two-story frame.
O.—A. H. Cren.
C.—M. Miller.
$6,000.

Two-story frame.
O.— G M. Gray.
C.—L. Hansen.

Market Reports.

No change in the price of lumber or other materials from the reports published in our last three issues.

A very simple test to ascertain whether the air of any apartment contains sewer-gas is made by saturating unglazed paper with a solution of one ounce of pure lead acetate in half a pint of rain water; let it partially dry, then expose in the suspected air—the presence of sewer-gas in any considerable quantity soon darkens or blackens the test paper.

PER ANNUM $2.00 IN ADVANCE

ENTERED AT POST-OFFICE AS SECOND CLASS MATTER.

ADVERTISING RATES.

Front Cover, outside, per square, each insertion	$ 2 50
Back " " " "	2 00
Pages preceding and following reading matter, per square, each insertion	1 50
Other inside pages, per square, each insertion	1 00
Full page, inside, one insertion	30 00
Each Subsequent insertion	25 00

Advertisements alone inserted that refer to materials used in the construction and furnishing of houses, and to matters and trades belonging to the building interest.

NO OTHERS RECEIVED.

Advertisements inserted for three months or less are payable in advance; payable quarterly when inserted for a longer period.

A square is ½ of an inch in length by width of the column. When money is sent for subscriptions, the receipt of a copy of this journal is an acknowledgment that it has been received Unless requested, we do not send receipts.

Bound Volumes of this Journal.

Bound volumes of 1879, 1880, 1881, and 1882 (in one book) complete, with all ads. and covers removed, will be sent to any address upon receipt of $8.00.

Bound volumes 1881 and 1882, each	$2.50
" " 1880 (only a few left)	$2 00

In 1880 the subscription price of this journal was only $1.50, and we have put the price of bound volumes accordingly.

Volumes of 1882 and those containing all the numbers from the first issue, bound in one volume, are supplied with a full index.

Any one failing to receive a complete index will be supplied by sending a postal card to this office with their address.

OUR NEW DRESS.

Substantial Evidence of the Success of This Journal.

No better nor stronger proof of the rapidly increasing prosperity of this journal can be offered, than that contained in its present issue. As will be noticed by scanning its pages, it appears in an entire new typographical dress, with four additional pages of reading matter and two pages of new advertisements added to former issues as a permanent thing. Occasionally we have been compelled to increase the number of pages temporarily, but hereafter there will be no less than appears in the present issue, with the probabilities of being required to add more to accommodate pressure in advertisements and specially interesting matter.

While gratifying to its management, thousands of warm and earnest patrons and friends will rejoice with us at this unmistakable evidence of the increasing prosperity of the only journal published upon the Pacific Coast, devoted to architectural, building, sanitary, and other sciences, and to mechanical pursuits and interests generally.

It has heretofore been promised that improvements, without regard to expense, should follow increased success, and such promises have been faithfully observed, as comparison of the past twelve months' issues with those of earlier dates will clearly demonstrate; and the present further improvement is but another step in the same direction, to be followed by others as rapidly as circumstances may favor.

With this feature of success, that of increase of subscription patronage is fully equal, requiring a permanent increase with this issue of 500 to meet the demand, and the cheering prospects that before another year shall expire its circulation will be almost if not quite double the present number.

TO OUR ADVERTISING PATRONS

this fact is very important. Many of those who have sought its columns have reaped handsome returns for the money expended in advertisements, and it is a further certain fact that its pages present superior advantages as an advertising medium to all parties dealing in building materials, house-furnishing goods, and things pertinent to and required in connection with the erection and fitting-up of buildings, and to all manufacturers, dealers, and others represented in its advertising columns.

Its management returns grateful acknowledgments for all the encouragements and favors received, and hope that their efforts in the future to make this journal one of superior excellence will be attended with even greater success than in the past.

The Trip to Duncan's Mill.

On the 26th ult., a delegation of architects —members of San Francisco chapter—accompanied by several draughtsmen and students, accepted an invitation to visit the red wood lumber regions of Marin County. The trip was made over the North Pacific Coast Railroad, and proved of great interest and pleasure to all who availed themselves of the opportunity. As all know who have ever enjoyed the pleasures of a ride over the road, it runs through one of the most picturesque and beautiful sections of California, and to those capable of appreciating the beauties of nature in its most enchanting forms—its hills and valleys, covered with verdure, trees, and growths of untold varieties—no more pleasing picture can be found upon the Pacific Coast; the stretch of road around the shores of Tomales Bay affording a beautiful water view, with hills rising grandly upon the opposite side, and the broad ocean appearing in the distance; beyond which the timber country lies in all its grandeur, with forests of trees still standing in their majesty, while the numerous immense stumps to be seen tell that the woodman's axe has felled most of the noblest monarchs of that region.

The company was handsomely received and entertained by Mr. Duncan, and every opportunity afforded to see the country surrounding the mills, including a ride on the logging train—on which cushioned seats were improvised by the generous-hearted host—to the logging camps four or five miles away; while the flowing waters of Russian River and its contributors added interest to the ride. We are unable in this issue to give all the interesting facts learned, and will therefore be compelled to reserve them until our next, by which time we hope to have many of the sketches made by our worthily ambitious young men who were present, reduced to cuts.

The more irregular the outline of your walls, the more unsatisfactory and expensive your roofs, and in this view, remember in planning, that next to a good foundation there is nothing of more importance than an efficient covering.

Master your trade, but do not let a pride in special or expert knowledge overmaster you, for the pedantry of the workshop or laboratory is as offensive as the pedantry of the school.

Shrinkage of Redwood Lumber.

"Shrinkage in lumber varies according to the tree from which it is made. Oak will shrink in drying a half inch to the foot, while the redwoods of California show no perceptible change, and the heavy eastern or South American woods lose but little."

WE have noticed the above "*clipping*" in several of our exchanges. and we are compelled to notice it on account of a decidedly wrong statement contained therein. "*Redwoods show no perceptible change*" in shrinking. Evidently the author of that statement is not acquainted with the wood he seeks to describe.

Redwood has the peculiar faculty of shrinking *endways* as well as in width. One needs to visit but very few of our dwellings to thoroughly convince him of this fact. It has been found (by actual experience) necessary to insert the following clause in the specifications under which the contractor is held. "*All the rustic and flooring to be stacked V shaped on the ground within ten days after the signing of the contract.*"

This precaution is absolutely necessary. The contractor seeks to pick out in the first place the driest lumber for all his finish work. It is then stacked on the ground and exposed to the weather for about 30 days. The joints in the rustic are made so well that they are hardly discernible a short distance away. Unless the lumber is extra dry, it will be but a short time before the joints begin to open; in many instances, so much so, that a liberal use of putty is necessary that the building may present a creditable appearance.

In wainscoting, when partly green lumber has been used, the shrinkage is often very noticeable. In fact red wood is like almost every other kind of lumber. If wet, it shrinks considerably end ways and side ways. If perfectly seasoned, it is one of the finest woods for general use. Where wide lumber is necessary, it takes the palm, as we can furnish perfectly clear lumber 10 ft. wide, and of any length from 10 to 30 feet. Of course 10 ft. is a great width and is only intended for fairs, exhibitions etc. But as a rule, redwood lumber is placed upon the market here, having a greater average width than any other class.

We make the above statement for the benefit of our eastern friends who are daily becoming more and more conversant with our splendid redwood lumber. It is statements like that at the head of this article that bring a great many truly good things in disrepute and we are not at all anxious that our grand California homogenous commodity should be in the least discountenanced by those who seek its use, and then condemn it because it shrinks, having been led to believe that no such results follow from its use.

San Francisco Chapter, American Institute of Architects.

THE regular meeting of the above chapter was held in the usual place Friday eve. May 4th, 1883. The President John Wright presided.

The committee on obtaining a permanent room for the association reported progress.

W. C. Jordan was elected a member as Draughtsman. The committee on classes reported as follows: Mr. Sanders remarked that the members of the classes were progressing finely. He thought it was a mistaken idea of the young students to favor the course of study in any one particular class. They should all receive attention and each class be regularly attended by each pupil. The members of the Chapter were requested to devise some method by which increased attendance could be secured. Mr. Pissis reported that much better progress had been made in his class over the preceeding month.

The Secretary was instructed to procure the sketches made by the Students during the late excursion to Duncan's Mills, and arrange them for publication in the June number of the *California Architect*.

An anonymous communication was received concerning the foundations of the Garfield Monument. The Chapter refused to consider the letter on account of no signature being attached.

A Mountain of Lime.

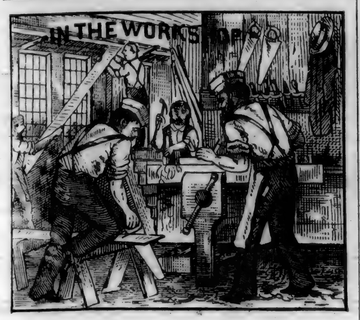
ONE of the most interesting objects pointed out to us while accompanying the late Press Excursion was a mountain of lime, situated near the town of Colton, in San Bernardino County. The mountain stands alone in a valley, and from its summit can be seen the Eden of the southern portion of our State, with its magnificent groves of oranges and lemons. Vineyards grace the landscape at every turn, and grand old San Bernardino mountain looks calmly on, carrying one's ideas back to the beginning of this world as so vividly portrayed in the GREAT BOOK.

We went over to the mountain, regretfully leaving our friends in Riverside, that we could be able to give our readers a description of the manner in which is fostered one of the great "to be" industries of the state.

Brother Holt, of the Riverside *Press*, succeeded in obtaining a complete description of the works. Our own time was too limited to obtain full information, and so we quote from our brother editor's notes.

"Two furnaces are now in operation, with a capacity of 175 barrels daily. The furnaces are 32 feet in height, one 4½ feet and the other 5½ feet in diameter; of slightly oval shape inside, lined with the best Scotch key fire-brick. The bottom is a square 12 feet high, each side 12 feet wide, braced within and without with heavy iron bars. From this rises a circle of ¼ inch boiler-iron, 16 feet high, separated from the brick circle by six inches of sifted wood-ashes, thus giving an elastic backing to withstand the expansion and contraction of the brick-work. A cast-iron ring, 1,900 pounds in weight, surmounts the circle, and above all stands a large wrought-iron hopper where all moisture is expelled from the rock before it enters the body of the furnace. Two arches on the north side of the square and two directly opposite hold four oil-burners, styled the Parsons & Northey hydrocarbon injectors. Crude petroleum stored in large tanks on the hillside above flows into iron tubes set under arches, where it is met by a jet of superheated steam, and forms with the accompanying air a hydrogen gas of tremendous heat-producing power. This flame is under perfect control, and is as easily regulated as an ordinary lamp. The calcining of limestone, which requires sixty to seventy hours in a kiln fired with wood is here accomplished in six hours. At regular intervals the draw-door is opened, and an iron car receives the red-hot lime, which is then dumped on the brick floor of the cooling room, 60 x 30 feet, where it is barreled after cooling. The barrels are then wheeled into the warehouse, 80 x 40 feet, which fronts on a siding of the S. P. R. R. From the time the rock is broken in the quarry it is on a descending grade until it is loaded into cars as marketable lime. The natural advantages of the location are great, and no pains has been spared to utilize them. In the quarry we observed the same character of solid, permanent work. High walls of stone and wood prevent the escape of rock while blasting, and a face of excellent limestone, 60 feet high, where one blast can throw down a hundred tons, allows a facility and cheapness in mining which we have never seen equaled. The rock lies in uniform layers, at an angle of 45°, and between these layers are found small veins of natural cement, gypsum, and alabaster. A judicious addition of these elements has given to this lime its high reputation for tenacity, hardness, purity, and hydraulic properties. Wherever it has been used, in brick-work, plastering, and finishing, cement-pipes, concrete-work, and whitewashing, the universal verdict has declared it superior to any lime hitherto used on this coast. It has been easily introduced into all parts of Southern California, and has even been shipped into Texas. The petroleum used is obtained at Newhall and is about 32° gravity, Oil from Puente has also been successfully used. Two large boilers, heated by oil-burners, furnish alternately the steam required. A neat and commodious boarding house has been built, where twelve employés are lodged and fed, a few rods below the works. A cooper shop will soon be added, and large contracts for staves are being filled by our lumbermen in the mountains.

The entire cost of the plant will not fall far short of $30,000. A royalty is paid to the Pacific Improvement Company, who have given a long lease of the property to the Colton Lime Company. Chas. N. Felton, President of the Pacific Coast Oil Company, is largely interested. Other prominent stockholders are J. E. Condict, President Central Gaslight Company, of San Francisco; Timothy Paige, Esq, and Dr. John Campbell, of San Francisco; E. A. Edwards, A. H. Miller, and D. W. C. Franklig, of Los Angeles, and L. F. Olmsted, of Colton, who is general manager of the company.



SETTING EDGE TOOLS.—In using the chisel for work that needs to be finely finished, the most common mistake made by beginners is to use it too long before resetting the edge on the oil-stone. Suppose that half an hour's work shortens the blade, as measured by the exact cutting edge, by 1-200th of an inch. To bring the edge once more to its original keenness requires a certain amount of rubbing on the stone, the amount corresponding to 1-200th of an inch on the flat face. In ten minutes' work the blade will be shortened by, say, about one third or 1-200th, or 1-600th of an inch, and the amount of rubbing to bring back the edge to the original sharpness after this amount of work, is not more than one-third of that needed in the first case. Thus, if in the half hour the edge be sharpened thrice instead of once, the total amount of rubbing required will be no greater than that needed at the end of the half hour, if no sharpening has been performed since the beginning of it; while, in the former case, the edge will at no time have become more than one third as blunt (*i. e.*, the edge no more than one third as thick) as it is at the end of the half hour in the latter case. Thus, by having the oil-stone always at hand, clean, and in good condition, and by having very frequent recourse to it to keep the chisel edge constantly sharp, a great deal of unnecessary labor is saved, and the work is done more nicely. Of course this rule cannot be followed unless the oil-stone is always ready to be used; otherwise much time would be lost in getting it ready so often. This rule also cannot be adopted to so great an extent with, for instance, plane-irons, with which a considerable amount of time is lost in taking the tool to pieces and putting it together again every time the edge is set. —*Cutting Tools.*

Do nothing in building by guess-work, and in its conduct trust not too much to memory, for a jotting or two at the proper time are worth a hundred jogs on the brain, for the purpose of safe recollection.

If you would set out good work, do it by practical geometry; if indifferent or bad, by the "rule of thumb."

A fair day's work for a fair day's wages should be estimated by its quality as well as its quantity.

IN planning stairs, think of your head-room from the lowest starting-point to the highest landing, or somewhere in ascending or descending stunning falls and broken limbs may accompany bruised foreheads and battered hats.

In making out building quantities do not overate them too much, for you may calculate too liberally for your own good, as well as estimate by guess-work too lowly to your own and others, loss.

Contrary to the old saying, "a carpenter is known by his shavings," he is known by the character of his work; and the state of his tools may be judged by the same standard.

The workman that makes the most noise will be often found doing the least work, and doing it badly.

Glaze your sashes with putty if you will, but make your mitres and other joints without it.

Hit the nail straight upon the head and you will save many crooked blows.

Sharpen your tools properly and you will husband your strength.

The Carpenter's Steel Square and its Uses.

WE have authority from the publishers of the above work to announce that we have been appointed

SOLE AGENTS ON THE PACIFIC COAST

for the sale of the above publication. A large shipment of books are on the way, and we are prepared to supply the trade. In accordance with our letter of instruction, in addition to the above work, we are sole and only agents for

Builder's Guide and Estimator's Price Book
Practical Carpentry
Hand Saws
Plaster and How to use it.

We particularly want to call the attention of those interested that the 75 CT. EDITION of the Steel Square and its uses is OUT OF PRINT.

The new edition has been revised and 30 pages of interesting and original matter added; it is now the best work in print, upon the subject of which it teaches. It is of a convenient size to be carried in the pocket. Single copies will be mailed to any address upon the receipt of the publisher's price.

☞ ONE DOLLAR ☜

PLAN the attic story for bedrooms if you will, but do not stow the servants in a cock-loft between the ceiling joists and the slates, which will be a frying-pan in the summer and a refrigerator in the winter—a choke-room instead of an air-space.

A KITCHEN and its belongings should not be planned solely for the comfort or ease of the cook, but for the general health of the household, for the purer the air below the purer will that be which circulates above.

BUILD with seasoned timber or you will build to your own discredit and others' loss.

Modern Perspective.

THIS new work is a treatise upon the principles and Practice of Plane and Cylindrical Perspective. The author—William R. Ware—discusses the subject somewhat differently from that generally given, greater prominence being assigned to the phenomena of parallel planes, and use being made of the laws thus established to determine the perspective of lines of intersection and of shadows—subjects that seem hitherto to have received but little attention. The author has certainly succeeded admirably in producing a work that should be in the possession of every Architect, Draughtsman, and Student in the country. The latter two classes should feel grateful that such men as W. R. Ware and others so study their future welfare, as to lay before them the results of a life's labor. Few of our students recognize the value of such a work. They should at once secure a copy, and notice the skill with which they are gently led along under the guidance of the skillful Master to thoroughly understand the Principal Rules of Perspective. Accompanying the book is a portfolio of sketches containing 27 large plates of examples of perspective in all its different phases, viz.: Perspective of Planes; division by triangles; parallel perspective; three point perspective; perspective of shadows, reflections, circles etc., curvilinear perspective; shadows by artificial light; the perspective of converging lines and numerous others. These plates are eleven by fourteen inches in size.

We have received copies of this work and can supply any orders sent. The book contains over 300 pages. Portfolio and book go together, the one explaining the other—Price for the two together $6.00.

THE *Art Amateur* for May contains some excellent simple designs for wood carving, from the Cincinnati School of Design, together with the first of a series of articles on "Practical Wood Carving for Amateurs, by Calista Halsey Patchin. Other articles of special practical value are those on portrait drapery, flower painting in water-colors, mural decoration, and embroidery in gold and silver. The May number concludes the fourth year of *The Art Amateur*, and the index for the last twelve months gives a vivid picture of the surprising wealth of designs and instruction contained in this invaluable magazine.

BEWARE.—*The Sanitary Engineer* gives this valuable piece of advice to housekeepers: Beware of disused "conveniences," and don't trust to the memory of any one for filling the visible trap with water. Better remove the whole fixture and seal up its outlet if not wanted for frequent use. Moreover, don't you put such an antiquated device as a pan-closet in a first-class house anywhere. Even if its receiver be ventilated, the vent-pipe may work the wrong way and deceive you.

Builders' Guide and Estimators' Price Book should be in the possession of every mechanic. Price $2.00.

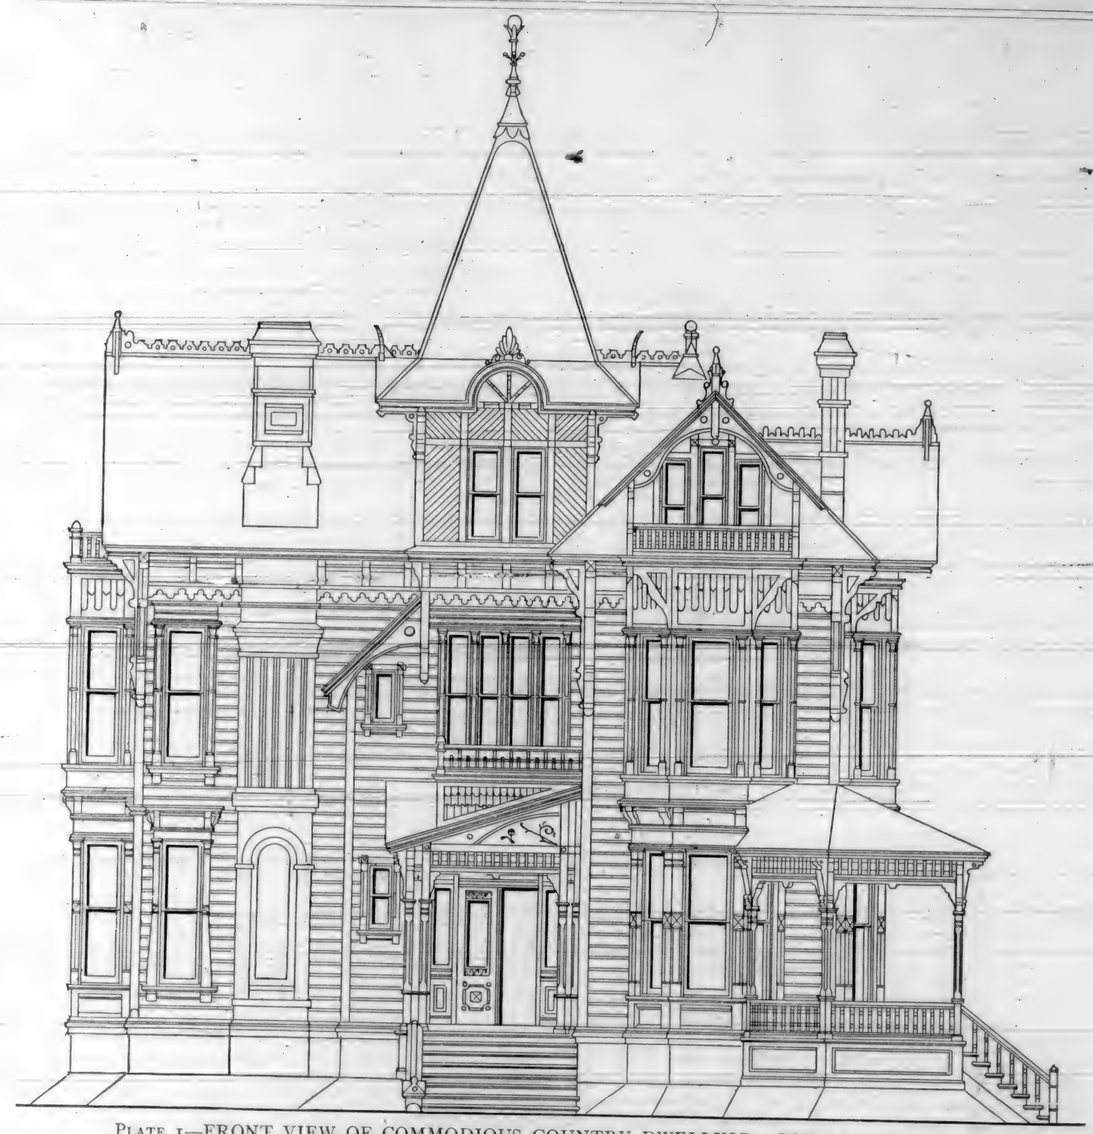


PLATE 1—FRONT VIEW OF COMMODIOUS COUNTRY DWELLING. COST, ABOUT $7,000.

Solid and Hollow Iron Columns.

A CONFUSION of ideas is sometimes found among practical men respecting the comparative strength of solid and hollow pillars. One hears it often said, for instance, that a hollow pillar is stronger than a solid one. Now this is, as one able authority has pointed out, not absolutely the case ; it is perfectly true, that comparing the strengths of two pillars of the same heighth and diameter, one solid and the other hollow, that the latter has the advantage of being economically stronger. The fact is, the solid column is stronger than the hollow of the same external diameter ; but the lesser area is more effective than the greater, because the central portions of the solid pillar are less useful in resisting the bending force than the metal in the circumference of the hollow pillar. But if the quantity of material in both the solid and hollow pillar of equal height is the same, the hollow pillar is by far the stronger. A simple geometrical construction will enable any one to understand this fact, by enabling us to proportion a hollow column of the same area as that of a solid one, by one of the diameters being given. It is shown, in fact, that hollow columns of the same area of metal as a solid one, may be made to any larger diameter, their strengths increasing proportionately till a limit is reached by the shell of the metal becoming too thin to insure a sound casting. Taking an example from Downing's work, a hollow pillar 9 inches in external diameter, having an internal diameter of 8.062 inches, and a thickness of metal of 4.7 inches, or about one half inch is five and one half times stronger than a solid pillar with the same quantity of metal. A thickness of one half inch may be regarded as a practical limit in manufacture.—*The Building News.*

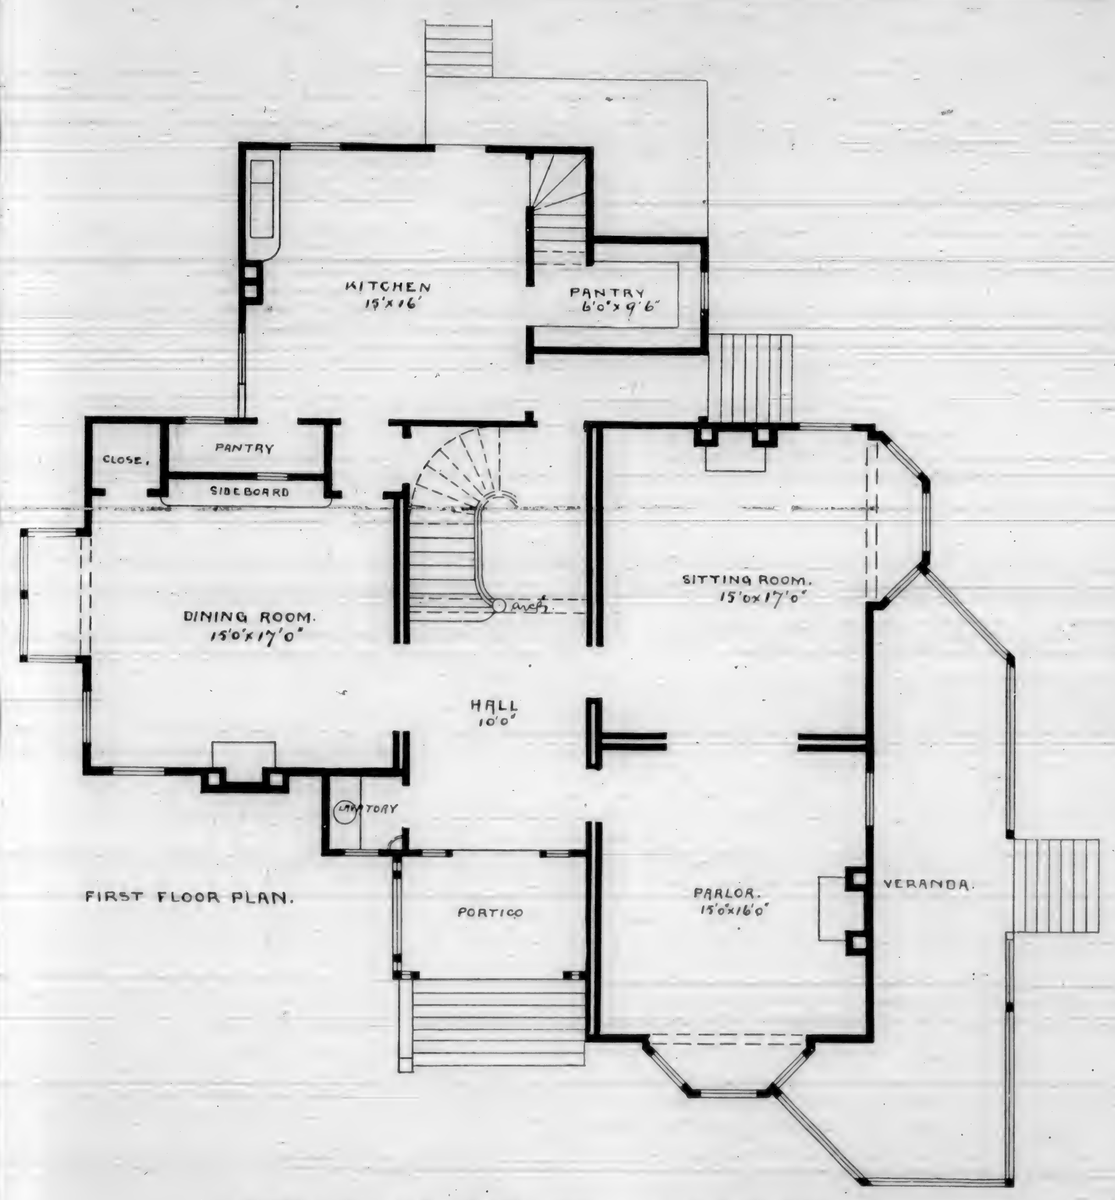

PLATE 2—FIRST FLOOR PLAN COMMODIOUS COUNTRY DWELLING.
